P R E F A C E .

THE year 1886, though not notable for any political movement in our country, or any great war in foreign lands, presents so much that is interesting and important in the movement of peaceful events, that there is an embarrassment of riches for this volume of the *ANNUAL CYCLOPÆDIA*. The usual excellent digest of the proceedings in Congress, this time covering a long session, will be found under its appropriate head; the year's history for all the great countries of the world is given, with the usual classifications; and most of the articles on the States of our Union are very full. The remarkable progress of American cities in the past ten years is shown in "Cities, Recent Growth of," where eighty-six of them are recorded in a form convenient for ready reference and comparison. These articles have been carefully condensed from a large mass of matter obtained from good authorities in the several cities; and the intention is to continue the subject with other cities in the next volume. Besides the general city articles, those on Albany and New York are especially interesting—the one for its bi-centennial celebration, and the other for the unveiling of Bartholdi's Statue of Liberty. The article on Music, showing what has been done, in recent years, in the higher walks of the art, is a new feature, supplementing the record of Fine Arts, which was introduced for the first time last year and is continued in this volume.

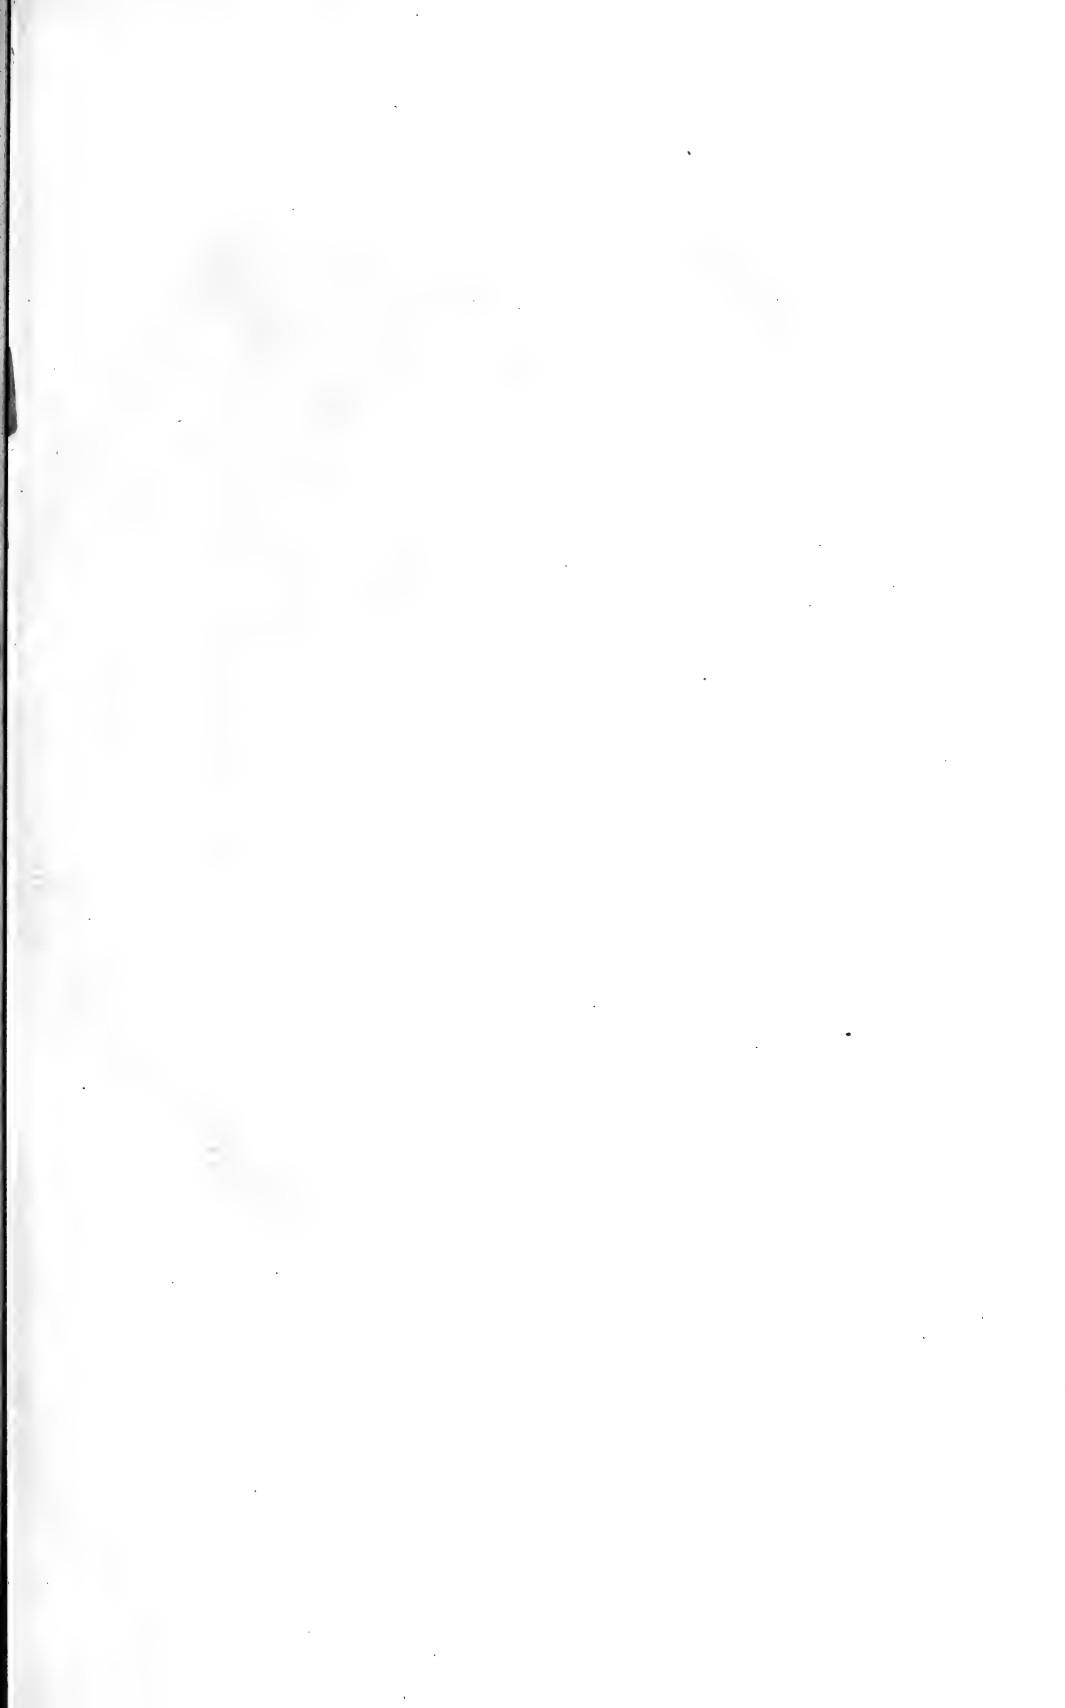

The death-roll is the most remarkable of any in recent years. It includes the names of one ex-President of the United States, Chester Alan Arthur, three candidates for the presidency—Horatio Seymour, Samuel J. Tilden, and Winfield Scott Hancock—and two candidates for the vice-presidency—Charles Francis Adams and John Alexander Logan—the candidacy of the two last named being more than a generation apart, and separated by the mightiest events of our history. The power of these events is illustrated in the contrasted careers of the two men. When Adams was the Free-Soil candidate, Logan was a pro-slavery Democrat; but at the time of their death, Logan was one of the extremists of the party that wrought emancipation, while Adams had practically gone over to the Democrats. Besides these, we lost in 1886 other historical characters, including General David Hunter, who anticipated President Lincoln in the policy of emancipation; Hon. David Davis, Mr. Lincoln's intimate friend; Asher B. Durand, the Nestor of American artists; and John

B. Gough, the most eloquent and eminent apostle of temperance. Literature has lost Paul Hayne, the Southern poet; and medicine Dr. Austin Flint. Among the noted men of Europe that have died are King Ludwig of Bavaria; Leopold von Ranke, the veteran historian, whose early work furnished Macaulay a subject for one of his most brilliant essays; Franz Liszt, the musician; Count von Beust, William E. Forster, and Archbishop Trench.

Among the other notable events in our own country were the disturbances in South Carolina, described under EARTHQUAKES, and the threatened social earthquake in Chicago described under ANARCHISTS. The progress of Cholera is noted under that head, the great works in Engineering are described with many illustrations, and the remarkable activity of the Iron and Steel industry is duly set forth.

Among the occasional articles the reader will find an interesting one on Library Economy, which is supplemented by a paragraph on the growth of free public libraries, in the article on New York City, both written by a veteran librarian; one on Bird-Songs, by a gentleman who has made a special study of that subject, with numerous dissections and experiments; one on Mushrooms and Toadstools, also by an authority; one on the recently revived theory of the Sea-Serpent, showing the form of the story in successive ages, and how it has grown; one on Recent Progress in the Higher Education of Women, by the Rev. J. Ryland Kendrick, D. D., ex-President of Vassar; one on Snow-Shoeing, the latest fashion in sports, by a snow-shoer; two that present new theories of the old subjects of Mirage and the Moon, by a skillful astronomer; a carefully prepared and valuable article on the Law of Railroad Accidents, showing how the statutes of the various States deal with the subject; and articles partly curious and partly useful on Cable-Railways, Crab-Farming, Cyclorama, Fair-Trade League, Faith-Cure, Game Laws, Natural Gas, Artificial Ice, Trained Nurses, Newspapers in the United States, Red-Cross Society, and other subjects. Many of these articles are profusely illustrated, and that on Earthquakes is supplemented by a colored chart.

A

ABYSSINIA, a monarchy in eastern Africa, comprising the kingdoms of Tigré, Amhara, and Shoa, and the provinces of Lasta, Waag, Godjam, and Kivara. The area is estimated at 200,000 square miles, and the population at 4,000,000. The reigning monarch is the Prince Kassai of Tigré, who was supplied by the British with arms when they left Abyssinia in 1868, after overthrowing King Theodore, and who, under the name of King John, was proclaimed Emperor of Ethiopia in 1872, after defeating the Prince of Amhara. The dependent kingdoms of Tigré and Shoa have been frequently in a state of rebellion against the Negus, who resides in Gondar.

The Italians at Massowah.—The Italians in February had constructed land and sea defenses, and armed redoubts, with numerous heavy and light guns. The garrison consisted of three battalions, numbering 3,000 men. There were besides Nubian Bashi-Bazouks, who served as escorts to protect caravans from robbers. The trade in hides and in ivory from the Soudan was brisk. The Italians treated the natives with consideration, and Gen. Gene, the commandant, was friendly with the Hababs.

Italian Mission to King John.—Gen. Giorgio Pozzolini, accompanied by the Cavaliere Bardi and Dr. Nerazzini, was dispatched in January on a mission from the Italian Government to the Negus. The Italian Cabinet hoped not merely to establish friendly relations with King John, but, through the possession of the seaport of Massowah, to acquire political influence and commercial ascendancy in Abyssinia. The embassy was empowered to negotiate for the station of Keren in the mountains, which would afford a healthful summer retreat for the Italian soldiers. The concession offered in return was that no duty should be imposed on exports from Abyssinia. The Italian envoys set out for Abyssinia at a time when King John had just returned from suppressing a rebellion. They bore a letter to Menelek, King of Shoa, who is a vassal of the Negus, address-

ing him as an independent sovereign, and explaining to him that the Italians had taken possession of Massowah in order to assist the English against the Soudanese. Menelek was frightened at receiving this letter, and forwarded it to King John, who became enraged at what he deemed an intrigue against his sovereignty, and refused to allow the mission to enter his territory. Captain Harrison Smith, who visited the Negus soon afterward with messages from the English Government, was received cordially.

Intercourse with Russia.—The Russians turned their attention to Abyssinia as a field for colonial enterprise, and sought some bond of sympathy with the rude form of Christianity existing there, for their ostensible motive. Free Cossacks who aided in the Russian conquest of the Transcaspian were encouraged to go to Africa as pioneers of Russian influence. Some enlisted under the successor of the Mahdi, while the Ataman Ashinoff, who formerly had difficulties with the Persian and the Turkish authorities, went on an embassy with presents to King John, and was well received. The Abyssinian Negus had made the first overtures for an intimacy with Russia in order to seek a protection against the approach of Italy, or new aggressions on the part of England or some other power. He was disposed, also, to form an ecclesiastical connection with the Russian Church, with which the Coptic religion has a closer affinity than with the churches of the West, with the object of introducing some of the benefits of civilization with purer forms of worship, and of emancipating his country from Egyptian and Mohammedan influence incident on the subordination of the Abyssinian Patriarch and clergy to the Patriarch of the Copts, who is a subject of the Khedive.

ADAMS, CHARLES FRANCIS, American diplomatist, born in Boston, Mass., Aug. 18, 1807; died there, Nov. 21, 1886. Mr. Adams was a grandson of John Adams, and son of John Quincy Adams, Presidents of the United States.

When two years old, Charles Francis was taken to St. Petersburg, Russia, where he

minister to England. As the civil war was in progress in this country, and the sympathies of the upper classes in England were largely with the Confederacy, the diplomatist found occasion for graver defense of his country than when he met the school-boys at fisticuffs. He was obliged to deal with some of the most complicated and delicate questions that can arise between nations, notably the capture of the Confederate commissioners, Mason and Slidell, and the building of the "Alabama" and other Confederate cruisers in British ports. In all of these Mr. Adams showed himself the wise and patriotic statesman. He was as far as possible from being the wily and intriguing diplomatist, but his bold and outspoken methods were only equaled by his determination and command of himself. He spent seven years in official life in England, and on his return retired to private life. He was made President of the Board of Overseers of Harvard College. He published numerous addresses and orations, and edited the memoirs and works of his father and grandfather, in 22 octavo volumes. (See steel portrait in the "Annual Cyclopædia" for 1871.)

ADVENTISTS, SEVENTH-DAY.

A history of the origin and progress of the

Seventh-Day Adventist Church was prepared by direction of the General Conference and published in the "Year-Book" of the denomination for 1886. From this account it appears that the formation of the Church was one of the indirect results of the preaching by William Miller, in 1840 and the following years, that the fulfillment of the prophecies of the second coming of Christ would take place in the year 1843. The passing away of that year without any evident verification of Mr. Miller's predictions produced various effects upon the minds of those who had put faith in the calculations on which they were based. A very considerable number of them still adhered to the belief that the prophetic period ended according to the interpretation that had been placed upon it, but concluded that a mistake had been made regarding the character of the events by which the ending was to be marked. Later in the year 1844, Mrs. Rachel D. Preston, a Seventh-Day Baptist, removed from New York to Washington, N. H., where a company of Adventists, holding to this view, were living. Becoming acquainted with them, she embraced the doctrine of the near coming of Christ, while they received from her the doctrine of the seventh day as the only true Sabbath; and, as this doctrine continued to be agitated through the ranks of the disappointed Adventists, "many embraced it with joy." Further

CHARLES FRANCIS ADAMS.

learned to speak Russian, German, and French. He was still a child when his father was appointed United States minister to England, and he was placed in an English school. It was just after the close of the War of 1812, and our relations with the mother-country were so unpleasant that the boy learned to use literal knock-down arguments in defending his native land. When the family returned to America, he was placed in the Boston Latin school, and in 1825 graduated at Harvard College. His father was then President of the United States, and Charles Francis spent two years in Washington, after which he was sent to study law in the office of Daniel Webster. His admission to the bar was obtained in 1828, and in the following year he married Miss Brooks, whose older sisters were the wives of Edward Everett and Rev. Nathaniel Frothingham. In 1831, and for five years thereafter, he was a member of the Massachusetts Legislature. He was a Whig, but so independent that in 1848 the Free-Soil party nominated him for Vice-President, on the ticket with Martin Van Buren. The ticket was, of course defeated, but from the movement sprang the Republican party, which in 1858 elected Mr. Adams to Congress, to represent the Third District of Massachusetts, and re-elected him in 1860. In 1861 President Lincoln appointed him to the post that had been held by his father and grandfather, that of United States

investigation led to the conviction that the cleansing of the heavenly sanctuary was the work entered upon at the ending of the 2,300 days of Daniel viii, 14, "or, in other words, the commencement of the investigative judgment. Thus was the great disappointment of 1843 fully accounted for, and Seventh-Day Adventists have ever since believed that the great Advent movement of 1840-'44 was in the order of Providence, and an exact fulfillment of the word of God." "The Advent Review and Sabbath Herald," which has continued to be and still is the leading organ of the denomination, was started by Elder James White at Paris, Maine, in 1850, and was afterward removed successively to Saratoga Springs and Rochester, N. Y., and to Battle Creek, Mich., its present location, where the Seventh-Day Adventist Publishing Association was incorporated in 1861. The statisticians of the denomination compute the number of believers in its doctrine throughout the world at between 25,000 and 30,000. They are to be found in every State and Territory of the United States, and in Canada, South America, most of the countries of Europe, Asia, Australia, New Zealand, the Sandwich Islands, and elsewhere. About 300 ministers are engaged in spreading throughout the world the knowledge of the doctrine by means of public lectures, Bible-readings, the circulation of books and periodicals, personal visitation, and correspondence. Six publishing houses issue 21 periodicals, in the English, German, Danish, Swedish, French, and Roumanian languages, and represent an aggregate invested capital of about \$400,000. The aggregate valuation of school property is about \$165,000; and the sanitary institutions at Battle Creek, Mich., and St. Helena, Cal., which are managed by incorporated organizations of Seventh-Day Adventists, represent other considerable amounts of invested capital. About 50 State conferences and camp-meetings were held during 1885, and were attended by probably 125,000 persons. A mission has been opened in Australia, and the English mission has been extended into Scotland, Ireland, and Wales. The circulation of denominational, health, educational, and temperance literature, is carried on by the International Tract and Missionary Society, assisted by 28 State auxiliary societies and about 10,000 agents. The aggregate number of members in Sabbath-schools is not far from 18,500. The American Health and Temperance Association, with 16 auxiliary associations and about 15,000 members, is another peculiar feature of the Seventh-Day Adventists.

The statistical reports of the Seventh-Day Adventist Church showed that it had at the end of the year 1885 in 28 conferences in the United States and Canada, and in the British, General Southern, and Scandinavian missions, 186 ministers, 151 licentiates, 741 churches, and 20,547 members, and that the whole amount of the contributions to the Systematic

Benevolence fund was \$122,641. These returns show increase from the previous year of 10 ministers, 6 licentiates, 36 churches, 1,845 members, and \$17,098 of contributions. Of members outside of the United States, 127 were in Canada, and 68 in the British and 142 in the Scandinavian missions, while 245 members were enrolled in the General Southern mission within the United States. The numbers include only those who are enrolled as members of organized churches. It is estimated that there are at least one fourth as many more who, from their isolated situation or other causes, are not yet connected with any churches, and that, if these were included, the whole number of Seventh-Day Adventists would be about 26,000. The International Tract and Missionary Society reported that its receipts had been, including a balance from the previous year, \$5,892, and its expenditures \$5,849. The General Sabbath-School Association reported receipts to the General Fund of \$134, and to the Publishing Fund of \$444. The Seventh-Day Adventist Publishing Association had property and goods valued at \$154,580 above its indebtedness, and returned a net profit on its year's business of \$7,360. It publishes a general denominational newspaper; a youth's paper; a hygienic journal; Danish, Swedish, and German papers; a Sabbath-school paper, and a paper devoted to evangelistic work. Its sales for the year amounted to \$61,785. Other publishing-houses are at Oakland, Cal. (value \$100,000), where three journals are published; Basel, Switzerland (value \$25,000), whence are issued a French, a German, an Italian, and a Roumanian paper; Christiania, Norway, where two Danish and two Swedish papers are printed; Grimsby, England, and Sumarlide, Victoria, Australia.

The resources of the Seventh-Day Adventist Educational Society were returned at \$46,322 above its indebtedness. The principal educational institution is Battle Creek College, Mich., which has classical, scientific, English, biblical, and preparatory departments. Other institutions are South Lancaster Academy, Mass., having academic, biblical, and industrial departments, and Healdsburg College, Cal., with five departments. Steps have been taken toward establishing a denominational educational institution in Europe.

The Health Reform Institute returned a net valuation of \$136,841; receipts for the year of \$87,654, and a year's net profit of \$3,529. It maintains a sanitarium, or health institute, at Battle Creek, Mich. Another health institute is situated at St. Helena, Cal.

The General Conference of Seventh-Day Adventists met in its twenty-fourth annual session at Battle Creek, Mich., Nov. 18, 1885. Mr. George I. Butler presided. In the reports on the condition of the denomination, representations were made concerning missionary or evangelistic work in various parts of the United States and Territories, Canada,

Australia, the Sandwich Islands, and Russia. The question was brought up of what attitude should be assumed by the denomination toward indictments for working on Sunday, which were beginning to be numerous in some of the States. Prosecutions had already been carried out against Seventh-Day Adventists in Tennessee and Arkansas for offenses against the State laws by working on Sunday, and the cases of the defendants had been carried up on appeal to the Supreme Courts of those States. The committee to which the subject was referred made a long report upon it, setting forth some of the reasons of the "Sabbath-keepers" for their practice, and advice in the matter, which was adopted by the Conference. Its principal points are: 1. The divine commandment to keep the seventh day as the Sabbath is obligatory, and allows of no option. 2. It is not only a most solemn duty to obey the precept of the law, but the God-given right is also claimed of enjoying the permission contained in the law, and the right of any government to take it away is denied. This permission is to work six days in the week. 3. When laws are enacted which take away the rights given by God, and which are used to hinder the keeping of his law, the authority of the Scriptures is given to obey him and keep his commandments, even at the expense of suffering the penalties of human enactments. 4. The *dictum* of the courts that the law forbidding all labor on Sunday is no infringement of the rights of any, is denied, for it would compel "Sabbath-keepers" to rest two days of the week. 5. Evidence was presented in support of the assertion that the arrests were acts of persecution. In view of the considerations presented, brethren were advised to "continue, in a peaceable and quiet manner, to obey God in keeping the seventh day," and to exercise their natural and religious right to work six days; in case of prosecution, to secure the best and most upright counsel; if convicted, to take an appeal to the Supreme Court of the State; if the conviction is affirmed then, to avoid paying fines, if possible, and suffer imprisonment instead; and, the adverse decision having been established, to contest no more cases, but let them go by default, and suffer the consequences.

On the question, "If a contractor sublets a part of his work, and the sub-contractor does work upon the Sabbath, is the contractor responsible?" the Conference, after considering in detail the difficulties presented under such conditions, expressed the opinion that a strictly conscientious regard for the Sabbath on the part of the contractor would guard him from making a contract which would wound his conscience, or give the world occasion to reproach him.

The Conference declared that it was neither consistent nor expedient to receive into the churches persons who hold to trine-immersion, and directed a work on the subject to be pre-

pared in the German language. A plan was adopted for calling attention to camp-meetings wherever they are held, by advertising, hand-bills, and the circulation of papers and cards of invitation. For the purpose of training evangelistic laborers, it was recommended that every conference, having within its boundaries cities of sufficient size to make such a step desirable, should establish at least one mission where candidates may be taught in connection with actual work. It was also advised that each of the missions should have connected with it a man and his wife. Stress was laid, in resolutions and reports, on the importance of ministers making their labors more of an educational character than of merely sermonizing, and of their becoming thoroughly informed. The jurisdiction of local elders was defined to be limited to the church which elects them, or, as the only extension allowable, to a church to which the elder may be sent, under special circumstances, by the Conference committee. Steps were taken with reference to having prepared a special history of the missions of the denomination. Appropriations were made of \$15,000 for the Central European mission, \$15,000 for the Scandinavian mission, \$5,000 for the English mission, \$5,000 for the Australian mission, \$10,000 for the International Tract Society, and \$10,000 for the support of city missions.

AFGHANISTAN., a monarchy in Central Asia. The ruler, called the Ameer, is Abdurrahman Khan, who resides in Cabul. He was placed on the throne under British protection, and is bound by treaty to follow British advice in his foreign relations, and the British Government is under a treaty obligation to aid him in repelling unprovoked aggression on his dominions. He receives a subsidy of a lac of rupees per month from the Indian Government. The Afghan tribes inhabit the mountainous region forming the valleys of the Cabul, Helmund, and Argandab rivers, and lying between the Hindoo-Koosh and Kohi Baba ranges on the northwest and the Soliman Mountains on the southeast. The Ameer rules also, as conquered provinces, the district of Herat, peopled mostly by a Persian race, and the northern slopes of the Hindoo-Koosh, as far as the Oxus river, which are inhabited by Tadjiks, Uzbecks, and semi-nomadic Turkomans.

Frontier Commission.—The British and Russian Governments appointed a mixed commission to demarcate the northeast boundary of Afghanistan separating that country from the newly annexed Turkoman districts of Russia in Asia, from the Heri Rud to the Oxus or Amu Darja river. The chief commissioner representing the British Government was Sir West Ridgeway, and on the Russian side M. Lessar. They began their labors in the autumn of 1885, and continued them until obliged to go into winter quarters. On March 12 they continued the survey; but the demarcation was soon stopped, to await the decision of their re-

spective Governments on claims advanced by the Russian commissioner which the British commissioner refused to allow. They then decided to proceed with the work, reserving doubtful points for the authorities at home to decide later. At Khoja Saleh there was a dispute about 50 square miles of territory, which was referred to the home authorities. The Russians claimed that the post of that name mentioned in the agreement of 1873 was situated twelve miles from the frontier line that is now locally recognized. The boundary commissioners were recalled before a decision was reached. Of 9,000 square miles that were in dispute when the commissioners began their work, 7,000 were conceded to Russia and 2,000 confirmed to the Ameer, but the latter comprised most of the fertile and valuable territory.

The boundary-line between Hauz-i-Khan and Maruchak, as defined in the protocol signed by the British and Russian delimitation commissioners, runs in almost a straight line from Hauz-i-Khan to a point four versts north of Robat-i-Kushan, thence in the direction of Maruchak in a straight line to a point a little southward of the mouth of the Great Pendjaryk, and then along the left bank of the Murghab to within three versts of Maruchak, where it crosses over to the other bank. Sir West Ridgeway, the British commissioner, after visiting Ishak Khan and conferring with the Ameer at Cabul, returned to India in October.

The Russian Advance.—The events of 1885, especially the collision at Penjdeh strengthened the position of the British in Afghanistan by turning the hatred and dread with which the English were formerly regarded against the Russians and leading the Afghans cordially to accept the British alliance. The fortification and arming of Herat by the English was gratefully accepted by the people of that city, as well as by the other Afghans. The Government and people of Afghanistan willingly agreed to the building of the railroad to the neighborhood of Candahar. The line has been laid to Pishin, the Chodja Pass fortified, and the Helmund line of defense effectually established by the Indian Government.

Vakhan.—While the boundary commissioners were engaged in marking the line on the northwest from the Persian frontier to the Oxus, both Russian and British emissaries were busy in raising new disputes in the east, where the actual limits of Afghan and Bokharan rule do not follow the river frontier agreed on between Earl Granville and Prince Gortchakoff in 1872. Col. Lockhart was sent on a mission of observation into that region, where Russian agents were inviting the inhabitants to place themselves under the direct protection of the Czar, as a security against the conquests prosecuted by the Ameer of Afghanistan at the prompting of the English. The Indian Government prepared to support the Ameer in an expedition into Badakshan. The rulers in the khanate of Vakhan, in the extreme northeast of Afghan-

istan, which has been considered as a dependency of the adjoining khanate of Badakshan, were induced to send a deputation to the Governor-General of Turkistan offering their allegiance to Russia on certain conditions. With the possession of this district the Russians would have the Chinese province of Kashgaria at their mercy, and would threaten Cabul. They would be near neighbors of India, and could spread their influence among the wild, unconquered tribes of the Himalayas, who are accessible from the Pamir and from Kashgaria. The aim of the Russian military policy was to turn Herat, after compelling the English to guard the approaches in that quarter, and menace India from another direction. The annexation of southern Bokhara was contemplated in connection with the building of the railroad, and it was rumored that the Emir was to be compensated by handing over to him the dominions of the Khan of Khiva.

The Afghans conquered the Tadjik khanate of Badakshan in 1870. Abdurrahman has maintained several thousand troops at Fyzabad, the capital, and smaller garrisons at other places, who treat the people with cruelty, and have forced the inhabitants of many towns to emigrate into Bokhara. This province is therefore in a chronic state of rebellion. Shignan and Vakhan, small khanates in the Pamir, have been invaded by the Afghans under the present Ameer. Shignan, with 28,000 inhabitants, lies within the sphere of Russian influence as defined by the arrangement of 1873, since it lies north of the Murghab river, though the English have discovered a second Murghab river that would bring the khanate within the bounds of Afghanistan. That Vakhan, which has only about 2,000 inhabitants, also falls to Russia under the agreement of 1873, the Russians are prepared to contend. With the possession of the Pamir they gain access to the passes of Chitral. The Russians have won in principle the ethnographical frontier that they sought to establish in the west. When they seat themselves in Bokhara and, without reference to the river boundary agreed upon, endeavor to apply the same rule on the northeastern frontier of Afghanistan, there will be a numerous population of industrious Uzbeks and Tadjiks, restless under the tyranny and extortions of the Afghans, eager to hand over to them a country of valuable resources, and with it the strategic command of Cabul and the Afghan valleys.

Revolt against the Ameer.—In October the Andarans and Tookhis, the two sections of the great Ghilzai tribe, with a portion of the Hazara tribe, joined by the robber-chief Sadu, under the command of the sons of the Woollah Muchki Alum, revolted against the Ameer's rule, and near Mukkur attacked and dispersed an Afghan regiment that was escorting treasure to Cabul. The latter, with a number of prisoners, fell into the hands of the rebels. The rising was connected with discontent at the excessive taxation levied by the Afghan Government. The Afghan au-

thorities announced later that the rising had been completely suppressed.

The Zhab Valley Marauders.—Sidar Shah Jehan, of Zhab, with his principal chiefs and maliks, arrived at Duki, on Jan. 17, 1886, to make his submission to Sir R. Sandeman, the governor-general's agent, thus fulfilling the terms of peace made with the Zhab tribes after the expedition of 1884.

The Transcaspian Railway.—The narrow-gauge railroad from Michailovsk to Merv is 1,335 versts in length, and has 63 stations. The first 510 versts, from Michailovsk to Artik, crosses a nearly waterless region extending to Kizil Arvat. From Artik to the Oxus is a distance of 470 versts, and from Tchichardjui on the Oxus to Samarcand 350 versts. The road runs for the most part through a sandy, uncultivated country, producing no fuel; but *astakhi*, or petroleum waste, for the engines, is furnished in sufficient quantities from the product of the Transcaspian oil-wells. The new harbor, opposite the island of Urzambada, southwest of Michailovsk, which is to be the depot of the railroad, was opened on May 22. Gen. Annenkov had returned from St. Petersburg, where on April 13 he obtained the sanction of the imperial ministry for the extension of the line through Bokhara to Samarcand.

Disturbances in Bokhara.—The compliance of Abdul Ahad, the new Emir of Bokhara toward Russia in regard to the railroad and other matters produced much discontent among his subjects, and a revolt was led by his brother, Abdul Mumin Khan, the Beg of Hissar, who was in correspondence with the eldest brother, the pretender, at Peshawer. The latter, Abdul Melik, called Kette Tore, or rightful heir to the throne, who is under British protection, threatens to drive his brother, the Emir, from the throne at the instance and with the assistance of the Indian Government. The Emir checked the movement in Hissar before it attained formidable dimensions, and transferred Abdul Mumin Khan to a similar post at Baison. Farther east a revolt of the Kiptchaks, who receive secret aid from China, disturbs the Russian province of Ferghana, formerly the khanate of Khokand.

ALABAMA. State Government.—The following were the State officers during the year: Governor, Edward A. O'Neal, Democrat; Secretary of State, C. C. Langdon; Treasurer, Frederick H. Smith; Auditor, Malcolm C. Burke; Attorney-General, Thomas N. McClellan; Superintendent of Public Instruction, Solomon Palmer; Railroad Commissioners, Henry R. Shorter, Levi W. Lawler, and W. C. Tunstall. Judiciary, Supreme Court: Chief-Justice, George W. Stone; Associate Justices, David Clopton and H. M. Somerville.

Condition of the State.—The Governor, in his message to the Legislature on Nov. 10, says: "During the past two years the State has been peculiarly blest. No great disaster has befallen its people. The public peace has every-

where been preserved. The laws have been faithfully executed. Life has been secure and property has been protected. The cost of government has been lessened, and taxes collected for the public use have been economically expended. Favoring seasons have given satisfactory returns to the labors of the husbandman. Agricultural prosperity has stimulated and rewarded commercial and manufacturing enterprise. Its mineral resources have challenged the attention of the world, and eager capital from remote countries hastens to their development."

Finances.—The Legislature of 1882-'83 reduced the tax-rate and increased the appropriations. This followed the defalcation of the State Treasurer for about \$250,000. The immediate result was a better collection of taxes and more prompt returns to the treasury.

The treasury balance, Sept. 30, 1884, was \$224,832. The receipts at the treasury from all sources during the year ending Sept. 30, 1885, were \$962,462.83, and the disbursements from it were \$916,924.52, leaving a balance of \$270,370.31, of which \$239,500.10 belonged to the general fund and was available for ordinary purposes. The treasury receipts from all sources for the year ending Sept. 30, 1886, were \$888,724.33, and the disbursements for all purposes \$818,366, leaving a balance of \$340,727.94, of which \$71,273.85 were special funds. In addition, moneys are paid direct by the county collectors to the County Superintendent of Education.

In 1885 and 1886 the total amount of taxes collected from the people (exclusive of county, city, and special taxes), in one form or another, on property, for licenses in fees and on polls, was \$2,592,673.91 (not including \$187,588.37 received at the treasury from other sources than taxes), of which \$934,075.12 was received and paid out in the counties, and did not come into the treasury.

Since 1875 the taxable value of property in the State has been as follows: 1876, \$135,535.792; 1877, \$130,709,128.57; 1878, \$126,773,262.85; 1879, \$123,757,072.85; 1880, \$139,077,328.22; 1881, \$152,920,115.14; 1882, \$157,520,551.25; 1883, \$158,578,157; 1884, \$167,124,594.49; and 1885, \$172,528,933.82. The bonded indebtedness of the State is now \$9,193,900. Of this \$7,700,000 bears interest at 4 per cent., \$539,000 at 5 per cent., and \$954,000 at 6 per cent.

Debt Settlement.—The settlement of the old bonded debt of the State under the act of Feb. 26, 1876, has not been entirely closed. About \$250,000 of old bonds, convertible into new class A bonds, and about \$200,000 of the indorsed Alabama and Chattanooga Railroad bonds are still outstanding. Under the act of Feb. 26, 1876, the State released to the holders of bonds issued under the act of Feb. 11, 1870, and loaned to the Alabama and Chattanooga Railroad Company, in satisfaction of all liability thereon, all its right to the lands and other

property mortgaged to it by the railroad company to secure the bond loan, and this property was conveyed to trustees for the benefit of the bondholders. This trust was to continue until May 1, 1886. On that day, 1,883 of the 2,000 bonds had been surrendered to the State.

Public Schools.—The report of the State Superintendent for the year ending Sept. 30, 1885, dated Jan. 11, 1886, shows a total school revenue for that year of \$511,540.05, of which \$21,500 was paid to the normal schools, and the balance apportioned among the colored schools. There were taught during the year, 3,647 schools for white children, and 1,744 schools for colored children. Of white teachers there were 3,565, and of colored teachers 1,827. The total number of teachers employed was 5,392, an increase of 210 over the preceding year. The average monthly pay of teachers in the white schools was \$23.76, and of teachers in the colored schools \$22.78.

On the 23d of April, 1884, Congress granted to the State of Alabama 46,080 acres of land for the benefit of the university, to be applied, so far as necessary, to the erection of buildings and to the restoration of the library and scientific apparatus destroyed by fire.

The Agricultural and Mechanical College is in a prosperous condition. Its faculty consists of ten professors and five assistants. During the present session it has 157 students.

Convicts.—Relative to the treatment of convicts, the Governor says: "Prior to 1882 little was known of the treatment and condition of convicts to the penitentiary. It was known that from the time of its organization the penitentiary had been a source of trouble, solicitude, and expense. Whether the convicts had been worked by the State under a warden, or controlled by others under lessees, the financial results were always the same, though there had been some improvements in this respect of later years, and since 1878 they had been self-sustaining. Of the convicts there was a uniform report of kind, considerate, and humane treatment, and uniform tables of an appalling mortality, and nothing more. It was not until four years ago that an official report informed the Governor and public that the convict-camps were unfit for use. The Legislature promptly passed the act of Feb. 22, 1883, 'to regulate the hiring and treatment of State and county convicts,' under which much was accomplished. The act of Feb. 17, 1885, which made some radical changes in the convict system and in the manner of the State's superintendence of convict-labor, was a well-considered effort in the direction of the humane ends of adequate punishment for crime. This provided for effective inspection, and armed the authorities with power to enforce all needful rules and regulations for the protection of the State and of the convicts." A comparison of the death-rate of a few years last past with that of a few previous years will make plain the progress toward a just and proper treat-

ment of convicts. In 1867, of each hundred convicts, 18 died; in 1868, 18 $\frac{1}{2}$; in 1869, 17; in 1870, 41, and in 1871, 14. In 1882, of each hundred convicts, 6 died; in 1883, 7; in 1884, 5; in 1885, 6; and in 1886, 2 $\frac{1}{2}$. In the biennial period ending Sept. 30 last, there were sent to hard labor for the counties 3,088 convicts, of whom during that time 2,017 were discharged, and 100 died, leaving 904 undergoing sentence.

The Deaf and Dumb and the Blind.—During the two years ending Sept. 30 last, 118 pupils were enrolled in the Institution for the Deaf and Dumb and Blind at Talladega, of whom 76 were deaf and dumb and 42 were blind, 68 being males and 50 females. At the close of the last year, there were in attendance 51 deaf and dumb and 32 blind pupils, of whom 50 were males and 33 were females. The last Legislature appropriated \$2,000 for repairing the buildings of the institution. The annual appropriation for the institution is \$18,000, which is used for salaries and for current expenses.

Insane.—On Sept. 30, 1884, there were in the Alabama Insane Hospital 630 patients, of whom 309 were men and 321 were women. To the 30th of September, 1886, there had been received 447 additional patients, and 344 had been discharged, leaving, at the latter date, 733 under treatment. In 1885 the daily average number of patients was 660, and in 1886 it was 722. Of the 344 patients discharged 189 were restored, 37 were sufficiently improved to be kept at home, and 32 were unimproved. Of those in the hospital Sept. 30 last, 350 were men and 383 were women. There were 38 paying patients and 695 indigent. Ninety of the patients were negroes.

Local Legislation.—Relative to local legislation, the Governor expresses the following views: "The evils of local legislation have long been recognized and felt; and the Constitutional Convention of 1875 put in the fundamental law of the State a provision intended to mitigate them. In commanding to the acceptance of the people the Constitution of that year, a committee appointed by the convention, and speaking for it, said, 'All power to enact local or special laws for the benefit of individuals or corporations is prohibited, and the people are thereby protected against the heavy expense of legislation in which they have interest.' This prohibition is so constructed that it does not prohibit, and the evils it was intended to diminish are increasing. In the pamphlet acts of the last session, there are 194 pages of general laws and 637 pages of local laws, many of the latter clearly in conflict with the intent of the Constitution."

Political.—The Democratic State Convention met in Montgomery on the 9th of June, and nominated the following ticket: for Governor, Thomas Seay; Secretary of State, Charles C. Langdon; Treasurer, Fred H. Smith; Attorney-General, Thomas N. McClellan; Auditor, Malcolm O. Burke; Superintendent of Educa-

ALBANY.

tion, Solomon Palmer; Chief-Judge of Supreme Court, George W. Stone; Associate Justices, H. M. Somerville and David Clopton. On the 2d of August this ticket was elected. With one county missing, the vote for Superintendent of Education was as follows: Democratic, 144,857; Republican, 28,688; Prohibition, 636. For Chief-Judge, the Democratic vote was 146,293; Republican, 36,867. The constitutional amendment relative to roads was voted down. A majority of the votes cast on the Birmingham amendment were in the affirmative, but, the vote being small, the ratification of the amendment is doubtful. The Legislature is almost wholly Democratic. On the 2d of November, eight Democratic Congressmen were elected. The Legislature met on the 9th of November, and was in session at the close of the year.

Confederate Monument.—On April 29, the foundation of a monument to the Confederate soldiers of Alabama who died in arms for the Confederate cause was laid on the grounds of the State Capitol in Montgomery by Jefferson Davis. Of this the Governor says: "It is designed to perpetuate the names and memories of all Alabamians who died in defense of the cause they believed to be just; and every county, city, town, and village in our State is interested in the early erection of this monument to commemorate the patriotism of those whose courage and devotion to duty were illustrated by their death upon the battle-field. . . . They did all that men could do, and the proudest epitaph that can be written upon their monument is, 'They died in defense of their country.'"

ALASKA. See UNITED STATES.

ALBANY. Bi-centennial Celebration of 1886.—The city of Albany celebrated the two-hundredth anniversary of the granting of its charter on July 22, 1886. The claim had been made by many of its citizens that no American city, save St. Augustine, Florida, had a charter of so great an age; but a careful review of the old Dutch records sustained the counter-claim that New York city had a charter older than that of Albany by several months. The Albanians, therefore, gracefully yielded priority, and celebrated their anniversary in a manner that appealed more particularly to their local pride. A brief glance at the salient points in the career of the city will make clearer an outline of the celebration itself. The first settlement of Albany was at Fort Nassau, on what is now called "Castle Island," just below the city. The date usually conceded is 1615, or six years after Hendrick Hudson ascended the river in the "Half-Moon." The high water drove the fort to the mainland, and another was substituted for it in 1623. The new structure, known as Fort Orange, stood near what is now Steamboat Square. There seems to be no doubt that the land surrounding the outlying village, called Beverwyck, was included in the original purchase of the Van Rensselaer part-

ners from the Indians. The matter was in doubt for many years, and the uncertainty led to a dispute of the Patroon's claim by the people of Beverwyck. Their cause was assumed by Peter Stuyvesant, Governor of the colony, who came from New York to fire cannon-balls all about the fort in defiance of the Patroon and his agent, Van Slechtenhorst. The Dutch soon (1664) lost the colony to the English, and Beverwyck was thenceforth called Albany, after the Scotch title of the Duke of York, afterward James II. The Patroon had succeeded in establishing his right to Beverwyck in advance of the conquest. A compromise was effected by granting a city charter, leaving the exact time of settlement to a future date, and resulting finally in a settlement of the Patroon's claim for a certain amount of money. It was also thought best to ask and to grant a city charter, because the "Charter of Liberties" had been recently put forth by the new General Assembly of the province, and

THE STADT HUIS.

also because the people of Albany had erected at their own expense a meeting-house, a watch-house, and a town-house. Therefore, in the early months of 1686, Thomas Dongan, Lieutenant and Governor of the province of New York, sent greeting "to all persons to whom these presents shall come or in anywise concern," relative to the chartering of the city of Albany. The new document was received by three prominent citizens of Albany, who went to New York city on that errand. They were Major Peter Schuyler, Robert Livingston, and Dirck Wessels Ten Broeck. The following appears upon the records of the first meeting of the justices of the peace thereafter: "In nomine Domini Jesu Christi, amen. Att a meeting of ye Justices of ye Peace for ye County of Albany, ye 26th day of July, A. D., 1686, Pieter Schuyler, Gent., and Robt. Livingston, Gent., who were commissionated by

ye Towne of Albanie to goe to New Yorke and Procure ye Charter for this Citty, wh. was agreed upon between ye Magistrates and ye Right hon Col. Tho. Dongan, Govr. Genl., who accordingly have brought the same along with them, and was Published with all ye joy and Acclamations Imagineable, and ye said Two Gentn. Receivd ye Thanks of ye Magistrates and Burgesses for there Diligence and Care in obtaining ye same."

The charter was engrossed on July 9, 1686, and given to the city on July 22 following. Notwithstanding it has been handed down from city father to city father for two centuries, the writing is still plainly legible on all but one sheet, and in that it has suffered more from constant handling than from the ravages of time. The charter is written on one side of nine large sheets of parchment, knotted together with what was originally red or blue tape or cord. The sheets are twenty-four inches broad by twenty-two inches in length, and retain their original stiffness, with the exception of the top sheet, which is the last one, as it contains the signature and seal of Thomas Dongan, the Governor. Dongan's name is particularly plain, and as written stretches one half of the length of the sheet down at the bottom. A knot of red and blue tape in the shape of a diamond separates the Christian name from the surname, and from the knot depends Gov. Dongan's great seal, which was originally contained in a thin silver box. The cover of the box is missing, but the other half remains. The seal looks as if it were made of cement, and it is attached to the cord by sealing-wax. The same design is stamped upon the face of the seal, but it is only faintly distinguishable. On one corner of the last sheet is this writing: "Recorded in the Secretary's Office, Province of New York, Book of Patents 440 to 470. J. S. Sprague, Secretary." The nine large sheets are yellow with age and dingy; but the engrossing shows that it was done by a skilled penman.

According to the charter, the mayor had the authority to give and grant licenses annually, under the seal of the city, "to all tavern-keepers, innkeepers, victualers, and all public sellers of wine, strong water, cider, beer, or any other sort of liquor." The mayor was also clerk of the market and coroner. As clerk, he, "and no other person or persons," had "the assize or assay of bread, wine, beer, wood, and other things to the office of clerk belonging or concerning." The penalty for refusing to hold and execute the office of mayor was a fine of not less than £20; for refusing to perform the duties of his office, an alderman was fined £10, current money; and the chamberlain, assistant, or sheriff, £5 of like money. Other forfeitures were provided for the minor offices. The right was given the citizens of Albany to "all waste and unoccupied lands lying within the limits of said city," together with the royalties of fishing, fowling, hawking,

mines, and minerals, and all other privileges belonging to and pertaining to said city, gold and silver mines excepted, likewise including the honorable purchase from the Indians of all lands that might be required for the city's welfare. All laws enacted by the Common Council were limited to one year only, unless confirmed by the Governor for a longer period, exception alone being made of the laws regulating Indian trade. The penalty for illegal trading with the Indians was the imposition of a fine not exceeding £20. The City Court was ordered to convene on the Tuesday of each alternate week throughout the year. All grants given during the previous twenty years were secured under the charter, and also all privileges heretofore enjoyed, provided they were not inconsistent with or repugnant to the laws of the kingdom of England. The Common Council should take special charge of all lands granted to the city by citizens for charitable or religious purposes, so that no construction should be made thereon other than that which might tend most to advance religion, justice, and the public good. Power was granted the mayor to issue papers of naturalization to those qualified to receive and desiring them. This was of the utmost importance, as no persons other than free citizens could use any art or trade mystery, or manual occupation, within the city limits, saving at the time of fairs and during the continuance of such fairs only.

The changes in the original charter have not been frequent; but the rights of the people have been steadily maintained. The name of the corporation is no longer "The Mayor, Aldermen, and Commonalty," but "The City of Albany." The latest charter was granted in 1883. Under its provisions the nominations of the mayor must be confirmed or rejected at the meeting of the Common Council to which they are sent or at the next regular meeting, or they will stand confirmed. The mayor, on the other hand, must send in nominations as soon as terms expire or vacancies occur. Hence dead-locks are impossible, and no political favorites of either the mayor or the Common Council can be kept in place by trickery. The Council is not allowed to audit its own bills. The different heads of departments are made more responsible for their acts, and the people are kept informed of what is going on by monthly statements. Best of all, the mayor holds his office for two years, and he is ineligible until another term shall have intervened. Perhaps in no other municipality in the country have the lessons of two hundred years been observed to so great advantage as in the city of Albany.

The Hudson river was the official eastern boundary of the new city of 1686. The southern boundary extended from the northern end of Martin Gerrison's Island for fifteen English miles in a northwesterly direction, to a certain kill or creek called Sandkill. The northern line extended from a post erected by Gov

Stuyvesant near the Hudson river, fifteen miles westward. The western boundary completed the parallelogram by connecting the western extremities of the north and south lines. The population in 1689 was 2,016; but this included the whole area of Albany county, which extended from Poughkeepsie to Canada, and from Connecticut river to the heart of the Mohawk country.

The first mayor, Peter Schuyler, had successive administrations that extended from 1686 to 1694. In 1709 Peter Schuyler, then a prominent man in the province of New York also, was sent to England with a deputation of four Indian kings, and was received at the English court by Queen Anne. The presence of four kings was so extraordinary an event in London as to attract attention, and the "Tatler" and the "Spectator," of Steele and Addison, gave entertaining accounts of their presentation at court. At the Queen's request, engravings of the four Indian kings, in national costume, in *aqua tinta*, were taken, copies of which were purchased for the State Library a few years ago. At the same time, a full-length portrait of Peter Schuyler was taken, according to report, by the great artist Van Dyck, and presented to Schuyler by the Queen. The artist, however, is believed to have been Sir Godfrey Kneller. The portrait is of full length and of large dimensions. It represents him in the costume of the day, and is executed in the best style of the times. Whether it be a genuine Van Dyck or not, it has genuine artistic value. On his return, Schuyler brought the portrait with him, and ever since it has been in the possession of the Schuyler family.

Albany has often been called the birthplace of the American Union. Here, in the old Stadt-Huis, was held the great convention of 1784, by the advice and with the sympathy of the English Government. Seven of the colonies sent the twenty-five delegates that were present, Benjamin Franklin, Sir William Johnson, John Penn, and Stephen Hopkins being among the number. New Jersey sympathized, but did not send delegates; while Virginia and the Carolinas wished to be counted as present, although they had no delegates. The Indians, and especially the Mohawks, under their sachem Hendrick, were loaded with presents, and swore so hard to serve the King that the Americans, twenty years later, had reason to regret that part of the performance. After several plans of union had been debated and rejected, Franklin proposed a union of the

colonies of Massachusetts, New Hampshire, Connecticut, Rhode Island, New York, New Jersey, Pennsylvania, Maryland, Virginia, North Carolina, and South Carolina. The plan was left for the consideration of the several colonies, and the American Union was the result a few years later.

During the Revolutionary War the Continental army made its headquarters in Albany. Schuyler, Clinton, Montgomery, and Lafayette had their personal headquarters in the city. The residence of Gen. Schuyler, just outside the stockade, was the scene of an attempted capture by British and Indians in 1781; but the general and his family escaped. In this residence a daughter of Gen. Schuyler married Alexander Hamilton in 1780, and a later owner, known as the widow McIntosh, here married ex-President Fillmore in 1858.

After New York became a State of the American Union, the Legislature was migratory for many years, Albany, Poughkeepsie, Kingston, and New York having about an equal division of the honors. Albany was made the permanent capital in 1797, and the old State-house in Broadway was occupied for several years. Then the old Capitol was occupied for seventy years, and finally the new Capitol in 1879. When Albany became the political capital, the city and county still held fast to the Federalists.

To group the foregoing, and many other interesting incidents of history, and to celebrate them in a worthy manner, was the work of the Citizens' Bi-Centennial Committee of Twenty-five. The celebration opened on Sunday, July 18, and closed on Thursday, July 22. On Sunday representative churches were selected, and in them were held appropriate historical services. Early on Monday morning the old north gate of the city, at the intersection of Steuben Street and Broadway, and the old south gate, at the intersection of Hudson Avenue and Broadway, were opened with quaint ceremonies by the mayor and city officers, a band of Iroquois from Caughnawaga chanting one of their songs of welcome. Then followed, through the day and evening, musical and literary exercises by the children of the public schools, canoe races along the river, the uncovering of historical tablets, a parade of manufacturers, builders, and trades organizations, a grand concert by school-children, and a band concert, with fireworks in Washington Park. A valuable feature of the day, and one of permanent interest to Albany, was the uncovering of the historical tablets of bronze. Some of them are worth quoting: "On this ground the Constitution of the United States was ratified in 1788"; "Here Gen. Washington was presented with the freedom of the city in 1782-'83"; "Van Rensselaer manor-house, residence of the Patroons, and site of the first manor-house"; "Upon this site stood the house occupied by, and wherein died, Anneke Jans Bogardus, 1663, the former owner

PETER SCHUYLER.

of Trinity Church property, N. Y."; "The Schuyler mansion, erected by Gen. Bradstreet in 1762. Washington, Franklin, Gates, Rochambeau, Lafayette, and most of the great

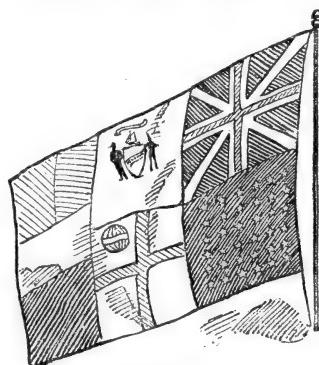

OLD DUTCH CHURCH.

men of that time were entertained here—Gens. Burgoyne and Reidesel as guests, though prisoners of war, 1777. Alexander Hamilton and Elizabeth Schuyler married here in 1780"; "The oldest building in Albany, built 1667, birthplace of Gen. Philip Schuyler," etc. Other tablets mark the old forts and the gates in the stockades, and still others (there being about forty in all) locate the first churches and school-houses, and show the changes in the names of the streets.

Tuesday was devoted to a parade of all nations, trial-heats of the annual regatta of the National Association of Amateur Oarsmen, Scottish games, musical and literary exercises by colored citizens, and an illuminated parade of Odd-Fellows, Knights of Pythias, and other fraternal organizations. On Wednesday morning the civic parade filled the streets. The final races of the oarsmen were completed in the afternoon. The evening witnessed a grand historical pageant that had been prepared with much care, after the manner of Mardi-Gras festivities. There were sixteen "floats," or emblems, each being drawn in procession through the streets, and lighted by colored fires. The subjects were these: The armorial bearings of the city; the Spirit of Discovery; the Northmen; the landing of Columbus; Fort Orange in 1624; Rensselaerwyck in 1630; a legend of the Catskills; Charter of the Duke of York, 1664; Dongan Charter, 1686; Summer Evening in Old Albany; the Schenectady Massacre; Surrender of Burgoyne; a Revolutionary heroine; the Last of the Patroons; the

Erie Canal; Prosperity and Progress. Thursday was known as the bi-centennial day, on which the military and Grand Army parade occurred, and the historical exercises took place. Gov. Hill delivered the oration, and William H. McElroy the poem. The ex-members of the Legislature had a reunion in the afternoon. In the evening the public festivities closed with a municipal reception at the Capitol to President Cleveland, Gov. Hill, and many other distinguished visitors, including representatives from the cities of Holland, whence the first settlers in Albany came. This was followed by a more private reception at the Fort Orange Club-house.

A very interesting feature of the celebration was the bi-centennial flag, which grouped, as nearly as possible, the nine flags that have floated over Albany from its earliest settlement to the present time. It consists of six parts. Beginning at the left, the first of the three large divisions is subdivided by a vertical line. A middle, broad stripe of white and a lower stripe of blue extend through both subdivisions. The upper left-hand corner is orange, while the rest of the stripe is red, thus reproducing the yellow, white, and blue of the Dutch India Company and of the Dutch Government. These flags floated over Forts Nassau and Orange until the English occupation in 1664. The red, white, and blue bands represent the present colors of the Dutch Kingdom, which floated over the fort

BI-CENTENNIAL FLAG.

during the few months of Dutch restoration in 1773-'74. The upper of the two central squares shows the coat of arms of the city in black, against a white ground. The lower central square is an English colonial flag, with a red cross upon a white ground, and a black globe in the upper left-hand quarter. The upper right-hand corner is the Union Jack, and the lower right-hand corner is the Jack of the Stars and Stripes.

Another feature of permanent value, aside from the bronze tablets, was the loan exhibition, which was open from July 5 till July 24. This was by far the most interesting and instructive affair of the kind that had ever been attempted outside of the larger cities; and even there the success, both as to finances and the merits of the exhibition itself, has rarely exceeded that of the Albany exhibition. It is a matter of congratulation, both for Albanians and for all others who seek the preservation of what is worthy in history, that the plan to make the loan exhibition a permanent thing is likely to be carried out.

ANARCHISTS. The Anarchist riot in Chicago of Tuesday, May 4, 1886, may be said to have begun in the eight-hour movement on the previous Saturday, or, more properly, in the attack on Monday, May 3, upon the McCormick reaper-works. The labor agitation throughout the country in the spring was more violent in Chicago than elsewhere. On Saturday, May 1, 40,000 laborers struck work and demanded a reduction of time from ten to eight hours. Chicago on that day presented a peculiar appearance. In the manufacturing districts the six and seven o'clock whistles were not heard. The usual hurrying crowds of workmen were not seen, and the streets did not contain half the number of trucks commonly in use. During the morning, however, several processions composed of the strikers were formed in the streets. Peaceable furniture-workers and mill-hands paraded, displaying American and German flags and banners, giving praise to the firms that had conceded the eight-hour day. A procession of 10,000 lumbermen, in front of which a man carried a red flag, visited several places and held meetings at which highly incendiary speeches were made. The discontented freight-handlers, to the number of nearly 1,000, marched around the depots and persuaded their fellow-workmen to join them. The freight-handlers of the Chicago, Burlington, and Quincy, and the Chicago and Alton Railroads, to the number of 300, had a brief meeting and marched to the Wabash freight-houses, where they persuaded eighty-five of the Wabash men to join them. The procession swelled and, with great cheers but no disorder, moved from station to station, everywhere urging men to join, who seemed unable to resist. The result was that every railroad in the city was crippled. All the freight-houses were closed and barred as for a prolonged state of siege, and all the industries of the city were paralyzed, for nothing could be delivered. These proceedings had here and there a threatening appearance. The freight-handlers who went to work were protected by guards with drawn revolvers. One of the processions was headed by a stout German, who carried a big wooden sword, which he had evidently fashioned with his own hands. Several of them marched like soldiers, their correct movements being cheered by the crowds

on the sidewalk. These last had no doubt profited by instructions received at meetings such as were afterward described at the trial of the Anarchists. It was observed by the detectives among the crowds of Germans, Bohemians, and Poles, that their talk was highly incendiary; but there was nothing to indicate such bloody results as followed. Many of the workmen appeared ready to accept reasonable terms from their employers, and did not wish to insist upon getting ten hours' pay for eight hours' work. But the demands of other laborers, particularly the lumbermen, were extreme. On Monday a great crowd of strikers, mostly lumbermen, inflamed by incendiary speeches, gathered about the McCormick works. Their quarrel with the workmen there was, that they were supposed not to have insisted upon the time-reduction. About half of McCormick's workmen were dissuaded or intimidated by them from going to work; but the other half, about 700, went to work as usual. During the day the company adopted the eight-hour time, and gave the men a half-holiday. The McCormick workmen, on coming out from their building, were attacked by the crowd with stones, and the men ran away or retreated into the building, the strikers meanwhile breaking a great many of the McCormick windows. The company's guard of a dozen men fired their revolvers into the air, hoping to frighten the strikers, who laughed at these demonstrations. The crowd had begun battering down the doors with crowbars, when a patrol wagon filled with policemen, dashed into the midst of the strikers, who threw stones and bricks at the officers. The officers alighted and drew their revolvers; but the mob kept on throwing missiles, the police dodging them as best they could. At length the crowd, great numbers of whom appeared to be armed, drew their revolvers and fired on the police, and the police returned the fire. The strikers being bad marksmen, none of the police were hurt; but about a dozen of the mob were wounded. On the arrival of re-enforcements, the police dispersed the crowd.

On that evening and the next day a handbill, printed in German and English, called upon the workingmen to meet at the corner of Des Plaines and Randolph Streets, on Tuesday evening, the 4th. "Good speakers," it was promised, "will be present to denounce the latest atrocious act of the police, the shooting of our fellow-workmen yesterday afternoon." At Des Plaines Street, Randolph Street, which runs east and west, widens out into a plaza, called the Old Haymarket, about 2,900 feet long by 150 feet wide. The crowd gathered just off the northeastern corner of this plaza in Randolph Street, 100 feet north of Des Plaines Street. About 1,400 men, including many who had been most active in the riot of the previous day, responded to the invitation. Half of these were driven away by a rain-storm, while those who remained were ad-

dressed from a wagon by August Spies, editor of the "Arbeiter-Zeitung," and by the Anarchist, A. B. Parsons. These speeches were rather mild; but Fielden, an Englishman, mounted the wagon and made an extremely violent speech of twenty minutes' duration. Meanwhile 200 police, under Captains Bonfield and Ward, were in readiness at the station in Des Plaines Street, less than 300 feet south of the wagon. When the tenor of Fielden's speech was known at the station, it was decided by the two captains that, in order to avoid a serious riot, it would be best to disperse the crowd. Accordingly 170 men drawn up in line were marched up Des Plaines Street, and when the police were within a few steps of the wagon, Captain Ward ordered the crowd to disperse. Fielden got down from the wagon, saying, "We are peaceable." At this moment a bomb with a lighted fuse attached was thrown from a crowd of men standing in an alley directly opposite the wagon. It struck the ground among the police, exploded, and worked terrible destruction among them. Numbers of them were wounded, officer Deegan dying almost immediately. The crowd then opened a destructive fire upon the police, sixty of whom were wounded by the bomb and the shooting, of whom seven died. The officers then charged the mob, firing their revolvers among them and killing and wounding a large number.

The trial of the persons charged with conspiring to throw the bomb began on the 15th of July, twenty-one days having been consumed in getting a jury. Spies, Parsons, Fischer, Fielden, Engel, Schwab, Lingg, and Neebe were the persons arraigned. Early in the trial Judge Gary gave a decision that greatly facilitated the conviction of the prisoners. His decision was this, that it is not necessary that the members of a conspiracy should have agreed to commit a murder at any particular time to constitute them accessories before the fact; that if murder has been agreed upon, and the time or manner of the crime has not been settled, the conspirators are nevertheless, when the killing has been done, guilty of murder. The evidence against the prisoners produced at the trial was mostly supplied by Anarchist informers, by detectives, the police, and the reporters. One of the informers, Waller, a Swiss, had been a member of the Lehr und Wehr Verein. This organization, as its name indicates, is a society for exercise and instruction in arms. It was incorporated under the laws of the State in 1875 by thirty German and Bohemian Socialists, and now includes 300 or 400 members, most of whom have seen service in foreign armies. They have been practicing military exercises to prepare themselves for conflicts with the authorities. Waller testified that he presided at a meeting of the society at Grief's saloon, the usual place of meeting, on Monday night, the 3d. He had seen in the "Arbeiter-Zeitung" the letter "T," and "Come on Mon-

day," which was the signal that there was to be a meeting. Fischer and Engel were present at this meeting. Circulars headed "Revenge!" were issued. The shooting of men at McCormick's was discussed. Engel introduced a resolution regarding what should be done in case there should be a conflict between the strikers and the police. In this case it was resolved that there should be meetings to aid the strikers. The word "Ruhe" (rest) was to be the signal for such meetings. The manner of fighting was also talked over. Engel suggested that a bomb should be thrown into the police-stations; and it was agreed that the mob should use bombs, fire-arms, or any other means of destruction, if they were attacked by the police. The society was to be represented by a committee at the Haymarket meeting. The question upon these measures was put to the meeting by Engel. Waller said that he had himself attended the Haymarket meeting, armed with a dynamite bomb.

Early in 1885 several of the largest property-owners in Chicago had employed Pinkerton's agency to make an investigation as to the real purposes of the Anarchists. One of Pinkerton's men, A. C. Jansen, testified that he was a member of the American branch of the International Workingmen's Association, and belonged to the armed section of that force. He had joined the organization with a view of finding out its objects. He attended all the meetings from February, 1885, till January, 1886, and was present at two meetings of the armed section. At one of these, Spies advised the shooting of a police-officer who had been accused of a serious charge, but had been acquitted on the testimony of his brother officers. Fielden referred to the dedication of the new Board of Trade, with this suggestion: "What a splendid opportunity there would be for some bold fellow, next Tuesday evening, to make the capitalists tremble by blowing up the building and all there is in it!" At one of the meetings, a man armed with a long sword, dressed in a blue blouse and wearing a slouched hat, requested all present to fall in line. The detective and two others stepped forward. On the drill-master's demanding that he should be vouchered for, the detective was at a loss what to do; but, to his great relief, Parsons volunteered to be his sponsor. The drill-master invited those present to inspect two tin boxes containing some improved dynamite bombs. At one of the meetings Parsons was elected lieutenant and proposed an attack on the First Regiment armory. In case of a conflict with the authorities, the International Rifles were to act with the Lehr und Wehr Verein. It will be seen that this evidence convicted Spies, Parsons, Fielden, and Engel of conspiracy. The same witnesses, and others, gave more evidence of a similar character.

It was further proved that dynamite bombs were in the possession of several of the accused. Dynamite was found in Spies's desk at the

"Arbeiter-Zeitung" office, and in the cellar of Engel's house. Evidence was given that the article in the "Arbeiter-Zeitung," headed "Blood," was in the handwriting of Schwab, who was an associate of Spies upon that paper. Concerning Fielden, an officer testified that at the approach of the police at the Haymarket, he exclaimed: "Here come the blood-hounds! You do your duty, and I'll do mine!" He said that, just as Capt. Ward was ordering the crowd to disperse, Fielden got down from the wagon and, saying, "We are peaceful," drew his revolver and fired point-blank at Bonfield, Ward, and the other officers. It was at this moment that the bomb exploded.

The evidence against Lingg was given by the informer, Seliger, a member of a Socialist group and recording secretary of the Carpenters' Union. The bombs were made in Seliger's house, under the supervision of Lingg. Seliger said he did not work at his trade on Tuesday. Lingg came on that day. He had previously told Lingg that he wished to have the bombs taken away from his house. In reply, Lingg told him to work diligently, and the bombs would be taken away that afternoon. Seliger went to work, drilling holes in the shells and filling them. Lingg went to a meeting, came back about one o'clock, and complained that Seliger had not worked hard enough; and, when Seliger replied that he had no pleasure in the work, Lingg said that they would have to work harder in the afternoon. He said the bombs were to be used that evening, and ought to be completed; they would make good "fodder" for the capitalists. In the evening Lingg and Seliger carried the trunk containing the bombs away from the house. They were met by Socialists, who opened the trunk and helped themselves to bombs. As they passed the Larrabee Street police-station, Lingg said it would be a beautiful thing to throw in a bomb. Then a patrol wagon approached, and Lingg said that would be a good opportunity. When Seliger said he thought not, Lingg became much excited and asked for a light from his cigar. Seliger lighted a match, taking time about it, so as to give the wagon time to pass. Lingg wanted to follow the wagon. Lingg showed the witness a copy of the "Arbeiter-Zeitung," containing the word "Ruhe," and said it was a signal for a meeting of armed Socialists on the west side. The two then went to a saloon where there were several other Socialists, one of whom said to Lingg, "You are the cause of it all." They were then told of the Haymarket affair. Lingg said nothing at the moment, but on the way home said that even now he was scolded and gibed at for the work he had done, and that his brothers in the cause did not appreciate him. They hid their bombs under the sidewalk.

Evidence was produced connecting Spies, Schwab, and Fischer with the throwing of the bomb. A witness testified that just before

the explosion he saw Spies hand a package to Schnaubelt, the missing Anarchist, who threw the bomb. He was walking in Randolph Street when the Haymarket meeting was assembling. He was near the wagon, when he saw Spies and Schwab pass into the alley. He heard the words "pistols" and "police" used by them, and heard one of them ask the other whether "one would be enough." They came out of the alley and went westward along Randolph Street, when they were presently joined by a third man, whom the witness recognized from a photograph as Schnaubelt. The three then turned and started toward the Haymarket, the witness following them closely. He saw Spies hand Schnaubelt something, which the latter put into his pocket. A moment later he heard Schwab say, "Now if they come, give it to them!" and Spies reply, "I don't think we can, for they won't give us a chance to-night." Another witness, Gilmer, testified that when Fielden was speaking, he was standing at the mouth of the alley near the wagon. He saw a man descend from the wagon and join a group of four or five persons standing in the alley. At that moment some one cried, "The police are coming!" Then the man who had left the wagon and joined the group in the alley, lighted a match and placed it against something held in the hand of one of the group, whereupon a fuse began to sizzle, and then immediately the bomb was thrown. The witness recognized a picture of Schnaubelt as that of the thrower of the bomb. He recognized Spies as the man that left the wagon and lighted the fuse, and Fischer as a member of the group.

Fischer was arrested at the "Arbeiter-Zeitung" office. He was armed with a revolver and a long knife. It was shown that he had written the words at the head of one of the Anarchist circulars, "Workingmen, arm yourselves and appear in full force!" Neebe distributed the "Revenge" circulars.

The defense endeavored to set up a new theory regarding the throwing of the bomb. It was, that the bomb did not come from the group in the alley near the wagon, but arose thirty feet south of the wagon, and was hurled through the air in a northwesterly direction, and therefore in a manner toward the speakers' wagon. Testimony was adduced to show that Spies and Schwab did not go into the alley previous to the opening of the meeting. Witnesses were examined to prove that it was the police who began the shooting after the explosion, and not the Anarchists; but these witnesses were usually shown, on cross-examination, to have been members of Anarchist or Socialist organizations. The defense also impeached the veracity of Gilmer, the witness who swore to seeing Spies light the fuse of the bomb. Several of the defendants were placed upon the stand to testify in their own behalf.

Judge Gary made an elaborate charge to the jury, in which he repeated the instruction to

which allusion has already been made. He said that if any one of the defendants attempted to overthrow the law by force, and threw the bomb, then the defendants who were in the conspiracy were guilty of murder. If there was a conspiracy, and the defendants were party to it, they were guilty of murder, although the date of the culmination of the conspiracy had not been fixed. The impracticability of the aims of the defendants was immaterial. He said that the jury might bring in a verdict of manslaughter in the case of any one or all of the prisoners.

The jury retired after the judge's charge, and, on the next morning, August 20, gave in their verdict, which was as follows: "We, the jury, find the defendants—August Spies, Michael Schwab, Samuel Fielden, Albert R. Parsons, Adolph Fischer, George Engel, and Louis Lingg—guilty of murder, in the manner and form charged in the indictment, and fix the penalty at death. We find the defendant Neebe guilty of murder in the manner and form charged in the indictment, and fix the penalty at imprisonment for fifteen years." The verdict was cheered by the crowd outside the court-house, and was received with great satisfaction by the people of Chicago.

Perhaps the defendants were not all of them the cruel wretches they appeared. They had been for a long time, in their meetings and newspapers, advocating the use of dynamite. Their newspapers referred to it as "this powerful agent of civilization"; and not only did these organs recommend its use in general terms, but they offered practical suggestions regarding the best methods of manufacturing it, as the following extract from one of them will show: "Dynamite is the stuff, and don't you forget it! Enough of it to fill your vest-pocket has power to do more for the wage-slaves of this country than a bushel-basket full of ballots. Fill a piece of gas-pipe with good stuff, plug up the ends, insert a fuse and cap, touch it off, and introduce it among a lot of rich loafers, and there will be a cheerful scattering of unemployed capitalists that will be felt for some time." They have been long talking in this way, but when the thing has at last been done, and real murders have been committed, they seem to be rather taken aback. Vanity has probably had quite as much to do with their actions as malice or a sense of oppression. It has been said by some one that the attraction of assassination to the poor man is that, when armed with this instrument, he may at least not be despised. When Engel's wife visited him in prison, and chided him for having placed himself in such a position, he wept and said: "I am cursed with eloquence. Louise Michel suffered for a cause. She is a woman. I am a man, and will stand it like a man." When the extract about dynamite, above quoted was read in court, the prisoners seemed to be greatly amused by the wit of it. Their theatrical and impudent behavior during

the trial no doubt bore against them. Certainly the feeling against them in Chicago was very strong. The sufferings of the brave policemen had evidently touched the popular heart. The prosecution at one time during the trial introduced in evidence a coat, showing many rents, which had been worn by a policeman whom the bomb had wounded in a number of places. The defense asserted that the purpose of introducing the coat was to affect the jury, to which the State's attorney replied that, if he had really wished to move the jury, he would have brought the officer and exhibited his wounds. The prosecution was ably conducted. The result of this trial seems to show that a campaign of dynamite, on the part of the discontented classes, can not be waged with much prospect of success.

ANGLICAN CHURCHES. Statistical Reports and Finances.—The "Official Year-Book of the Church of England" gives the following summary of voluntary offerings devoted, during the year 1884, to the building, restoration, and furnishing of churches, the endowment of benefices, the building of parsonage-houses, and the enlargement of burial-grounds. Grants received from the Ecclesiastical Commissioners and Queen Anne's bounty are excluded:

DIOCESE.	Amount.	DIOCESE.	Amount.

Burial-grounds.....	7,381

Total..... £1,455,839

The "Official Year-Book" further gives the following summary of the voluntary contributions of the Church for the funds and purposes named for the twenty-five years, 1860 to 1884: For theological schools and education of candidates, £528,653; for church building and restoration, etc., £35,175,000; for home missions, £7,426,478; for foreign missions, including missionary colleges, etc., £10,100,000; for elementary education, £21,362,041; for circulation of literature, etc., £987,841; for church institutes, £71,660; for charitable work (distinctively Church of England institutions), £3,818,200; for clergy charities, general and diocesan, £2,103,364; total, £81,573,237. The summary is inclusive of and confined to societies and institutions organized and administered by the Church of England alone. From

it are omitted certain distinctive church societies, institutions, and charities concerning which the committee having the publication in charge could not obtain information; contributions devoted to parochial purposes, such as the maintenance of assistant clergy, church services, institutions of a local character, relief of the sick, etc.; funds devoted to the founding and maintenance of middle-class schools; contributions devoted to societies and institutions distinctly unsectarian in their aim and administration; and the incomes of the sisterhoods of the Church.

Ecclesiastical Commission.—The report of the Ecclesiastical Commissioners for England shows that since 1840, when the common fund was created, benefices to the number of 5,300 have been augmented and endowed to the amount of £739,000 per annum, in perpetuity, or in capital value to the amount of £22,170,000. Benefactions by private donors, conveyed to the commissioners, amount to £4,530,000, which represents an increase of endowment of £151,000 a year, and if to these sums be added £26,000 a year specially contributed by benefactors for mining districts, it will be seen that the total increase of benefices amounts to £916,000 per annum, an income which represents a capital sum of £27,480,000. The commissioners' funds having been seriously affected by the continuance of agricultural and commercial depression, they say that there is reason to believe that the income of the commission has for the present ceased to expand. For 1886 it would be possible to make an appropriation of £450,000 of capital, or an annual charge of £15,000; and this would be expended in meeting benefactions offered in favor of benefices to the capital amount of £80,000; in endowing to the amount of £2,400 a year churches to which districts have been assigned since 1881; and in meeting local claims on estates vested in the commissioners.

Benevolent Societies.—The home income of the Colonial and Continental Church Society was reported, at the anniversary in May, to have been £16,501, and the expenditure £17,335. The Church Pastoral Aid Society returned an income of £54,226, with 772 grants on its books. The number of parishes benefited was 640, in which was included a population of more than 5,000,000 souls. The Spanish and Portuguese Church Aid Society, whose annual meeting was held May 26, under the presidency of the Archbishop of Dublin, returned an expenditure for the year of £5,908, and a deficiency of £382. It employs thirteen ordained persons in the Reformed Episcopal Churches of Spain and Portugal. During the year a new mission hall had been opened at Seville, and new churches built at Villaescusa and Lisbon. In accordance with recommendations that had been made in the previous year, a missionary clergyman had been appointed for the supply of an itinerant evangelistic mission. The receipts of the South American

Missionary Society, as reported at the anniversary, April 30, had been £12,008, and the expenditures had been £13,814. The society sustains missions among the Indians of South America, chiefly in Patagonia and the region of Cape Horn, and cares for the religious wants of English residents in various parts of that continent. Its work is covered by the diocese of the Bishop of the Falkland Islands.

Society for the Propagation of the Gospel.—The annual meeting of the Society for the Propagation of the Gospel in Foreign Parts was held February 19. The gross income of the society for the year had been £117,971, of which amount £101,825 had been contributed to the general fund, and £16,146 to special funds, or for the benefit of particular dioceses and missions. The whole amount of contributions to the general fund was greater by nearly £9,000 than in any previous year of the society's existence. The number of ordained missionaries, including ten bishops, on the society's lists, was 575. Of these 166 were laboring in Asia, 142 in Africa, 15 in Australia and the Pacific, 195 in North America, 31 in the West Indies, and 26 in Europe. There were also in the various missions of the society about 1,700 catechists and lay teachers, mostly natives, and about 350 students in the society's colleges.

Church Missionary Society.—The annual meeting of the Church Missionary Society was held in London, May 4. The Hon. F. Maude, R. N., presided, taking the place left vacant by the death of the Earl of Chichester, the former president of the society. A resolution was adopted expressing a grateful sense of the value of the services of the late president. The total ordinary income of the society for the year had been £201,287, a sum higher by £835 than the largest ordinary income ever previously reported. The expenditures had been £211,992. The report spoke of the progress of the native churches, some of which were planning their own missions and sending out their own missionaries; of the bravery with which native converts remained true to their professions in the face of great peril; of the abundant fruit granted to the society's direct missionary labors in the heathen and Mohammedan world; of the lament of one heathen antagonist that "the leprosy of Christianity is spreading fast everywhere"; and of the progress of the zenanas, the medical departments, and the work of translation of the Bible and Christian books into the languages of the heathen countries. The following is a general summary of the missions, which are situated in Western Africa (including Sierra Leone, Yoruba, and the Niger river), Eastern Equatorial Africa, Egypt, Arabia (Aden), Palestine, Persia, India, Ceylon, Mauritius, China, Japan, New Zealand, Rupert's Land, and the north Pacific region of British America: Number of stations, 271; of missionaries in holy orders (European 230, Eurasian, etc., 11, native clergymen 250),

491; of European lay missionaries, 38; of European female teachers, 20; of Eurasian teachers, 25; of native Christian unordained teachers of all classes, 3,289; whole number of missionaries and teachers, 3,863; number of native Christian adherents (including catechumens, but the great majority baptized), 185,878; of communicants, 42,717; of schools, 1,868, with 69,256 pupils. A serious feature in the history of the society's missions has been the murder of Bishop Hannington, of the Eastern Equatorial African mission, by order of the King of Uganda, followed by the institution of persecution against the native Christians in that country, with many martyrdoms.

Liberation Society.—The Triennial Conference of the Society for the Liberation of Religion from the Patronage and Control of the State was held in London, beginning May 4. Mr. Alfred Illingworth, M. P., presided. The treasurer's report showed that the society had received, during the past year, £7,957, and had paid out £7,438. The report of the Executive Committee represented that the question of disestablishment was now in such a position as to command the attention of Parliament. Nowhere had the cause made more progress than in Wales. The recent division on Mr. Dillwyn's motion for the disestablishment of the Welsh Church showed the extent to which the feeling prevailed, twenty-seven out of the thirty Welsh members having voted for it. In Scotland, Mr. Gladstone's influence at the last election had kept back the question, as was shown at the recent division on Dr. Cameron's motion for disestablishment. The committee had carefully prepared for the event of the recent election, and the result was the return of an unprecedented number of candidates in favor of disestablishment. Events within the Establishment were all tending to show that the existing system was untenable. The result of the general election had been to give a great impetus to the movement for church reform. But churchmen were greatly divided as to what should be done, and there was a growing conviction that no really effective reform could be had so long as the Church remained established. Resolutions were passed recognizing the results of the late general election as a sure indication of the successful issue of the present labors of the society; in view of the increased activity of the defenders of the present established system, the possibility of an appeal to the constituencies at an early period, and the present state of political parties, acknowledging the necessity for such action as will be not only firm and vigorous, but adapted to the advanced position of the society's movement. "In particular," the resolution continues, "this Conference urges the importance of efforts to secure the inclusion of the principle of disestablishment in the future policy of the Liberal party, and of any future Liberal administration." Another resolution favored the immediate amendment of

the Burial Acts on the lines proposed by the Government bill, which was at the time pending in Parliament—which, it was assumed, if carried, would render legal shorter notices of funerals, or, the clergyman consenting, funerals without notice, would give to extra-parishioners the same rights of burial by their own ministers as parishioners enjoyed, and would remove sectarian distinctions from cemeteries. A resolution was also adopted declaring that "the question of national education having been raised anew by the appointment of a Royal Commission, and also of a select Committee of the House of Commons in regard to educational endowments, the Conference is of opinion that it is of the highest importance that strenuous efforts should be made to put an end to the grave violations of religious equality committed under the existing laws, and to place the educational system of the country, in all its branches, on an equitable and unsectarian basis. And the Conference is further of opinion that, to secure such a result, the funds of the nation should not be appropriated to either schools or colleges of a sectarian character, and which are under the sole control of denominational managers." A resolution, adopted after the reading of a paper by the Rev. J. Guinness Rogers on "National Religion without a State Church," expressed the opinion of the Conference that "national religion can exist only to the extent to which religion influences the minds and lives of the individuals of whom the nation is composed, while the establishment of churches by the State necessarily involves more or less of injustice, and both fetters the action and secularizes the character of the churches which are established. Looking to the zeal and to the liberality of the various religious communities of this country, the Conference is firmly convinced that a policy of disestablishment—already successfully adopted in other parts of the British Empire and in the United States of America—may be adopted in the mother-country also, not only without danger to its highest interests, but to the promotion of the spiritual welfare and the peace and unity of its people."

The secretary of the society reported that there were now 228 members of the House of Commons who might be relied upon to support the cause of disestablishment; there were 63 doubtful members. Of the views of 13 they had no definite information; and there were only 29 Liberals in the House of Commons who had distinctly declared against disestablishment. The Conference approved the movements for disestablishment in Wales and Scotland, and denied the practicability of attempting by parliamentary legislation to effect a reform of the Church.

The Church Union.—The twenty-seventh annual meeting of the English Church Union was held in London, May 27. Viscount Halifax presided. The report of the Council showed that the Union had received a net gain of 600 mem-

bers during the year, and that the whole number now on the roll was 21,470. Notwithstanding the comparative cessation of prosecutions for ritualism, the sustentation fund was still needed to supply the losses of income which had been incurred by some of the deprived clergy, and there was a possibility that more might yet be added to this class. While few things were more to be deprecated in the interests of the Church than identification with any one political party, it was the duty of churchmen, whatever their political opinions, to show that whoever attacked the Church could not reckon on their support. The fact that the revival of church principles had been most effectually manifested in the large towns went to show that the strength of the Church would be in exact proportion to the adherence of her members to her principles, and that the only real and adequate church defense was the teaching of church doctrine. Seventeen bishops had consented to become vice-presidents of the Union. The president of the organization asserted in his address that the three principal objects for which the Union had contended during the last twenty years—viz., to win back for the Church of England her ancient freedom from the interference of secular courts external to herself in the decision of spiritual matters; the vindication of the right of the Church to use her ancient ritual; and the complete organization of the clergy and laity in synods and conferences—had been obtained, or were in the course of being obtained. As the lower house of the Convocation of Canterbury had declared by resolution, the Church of England was national, not in the sense that the nation, as such, might deal with its doctrine and discipline, but that it had a duty to the whole nation. A resolution was adopted, declaring, without committing itself to a particular measure, that the Union is ready “to support any well-considered scheme for the prohibition of the sale of next presentations, and the gradual extinction of the traffic in livings.” Other resolutions urged the importance of the restoration of the ancient diocesan synods of the Church, in addition to the conferences of clergy and laity; and, while expressing a disposition to “welcome any legitimate scheme by which the co-operation of the laity in church work can be effectually encouraged,” renounced all proposals for the creation of church boards with statutory authority, and insisted, in the case of voluntary parochial councils, on the necessity of such councils being limited to communicants.

Church Defense Institution.—The annual meeting of the Church Defense Institution was held in London, Aug. 2. Lord Egerton, of Tatton, presided. The report of the Executive Committee related that the period dealt with, embracing as it did two general elections, had been one of much anxiety and importance, involving the most serious issues to the cause of

church and state. The spirit and success with which the Liberationist attack in the autumn of 1885 had been met had speedily demonstrated to its promoters that such an attack was at least premature. Still, while the Church might be secure from direct attack, there were many ways in which she might be harassed and her usefulness impaired; and the need of watchfulness and hard work would therefore be as great as ever. The receipts of the Institution had been £12,911, as against £4,570 in the previous year. Details were given respecting the work performed by the Institution during the year, which appeared to be directed chiefly to counteracting the efforts of the Liberation Society.

Convocations.—The Convocation of Canterbury met Jan. 13, in St. Paul's Cathedral, when the Latin sermon was preached before it, and Archdeacon Sumner was elected prolocutor of the lower house, to succeed Lord Alwyne Compton, who had been nominated to be Bishop of Ely. The first meeting of the Convocation for the dispatch of business was held at Westminster, Feb. 16. The meeting was made of peculiar interest by its being the occasion of the formal installment and opening by the archbishop of the newly established House of Laymen. The new house consists of 102 laymen, “faithful members of the Church of England,” who are elected by the different diocesan councils. It does not exist as an independent body of convocation, for it has not even the power of the other two houses, but merely as a body brought together to consult with the Convocation as previously constituted; and it is wholly optional with the other two houses whether it be consulted. A considerable number of the members of the House of Laymen were already members of Parliament, or otherwise prominent in the public life of England. The archbishop, in addressing the newly constituted house, mentioned several subjects concerning which the Convocation would like to hear the views of the members. Among them were those of church patronage; the sale of glebe-lands; “the disproportion of clerical work or responsibility to clerical incomes”; parochial councils, in which were involved the questions of the greater participation of the laity in church affairs, and “some power of remonstrance against the appointment of a pastor whom the parishioners can show to be unfit”; and the institution of a central organization which should worthily answer to the reformed parochial organization, concerning which the speaker remarked that he did not see “how a national body of bishops, clergy, and laity, can express themselves fully, so long as the two convocations meet apart, unreformed, incomplete, and without adequate lay counsel.”

Much attention was given to the consideration of the subject of “Church Reform,” under which title are included a number of propositions for correcting features, the work-

ing of which is inconvenient or has been attended with abuses, and for making the Church more fully representative of the people of the nation. The bishops, after a discussion of two days, agreed upon a report that, in their opinion, the reforms which required immediate attention were the removal of the various evils and abuses connected with the sale of patronage; simpler and more effective methods of removing from the cure of souls incompetent and criminous clergymen; the correction, so far as may be found expedient and practicable, of anomalies in the endowments of the Church; the enlargement of convocation and the statutory concession to it of increased power in the internal regulation of matters involving the efficiency of the Church; and the assignment to "the faithful laity" of a more clearly defined share in the administration of the affairs of the Church.

The house further adopted a report expressing its approval of a comprehensive measure of reforms, the draft of a bill providing for which was to be introduced by the archbishop into the House of Lords; approving the Pluralities Acts Amendment Act of the previous session of Parliament, but suggesting that further steps were urgently required, "and that greater security against the ministrations of unworthy clergymen should be given to parishes, by the simplification of existing modes of procedure, and by enactments which may obviate the ruinous costs which at present are often incurred in suits of this nature, especially in cases of suspension from office and deprivation"; recommending the formation of a central fund raised by equitable taxation of ecclesiastical incomes—the principles of which already existed in the system of first fruits and tenths—for the reduction of existing anomalies in clerical incomes, and to improve the incomes of benefices of small value; calling attention to plans for enlarging the representation of the parochial clergy, and for the institution of "such changes in the rubrics and such additions to the services of the Church, as may give fuller scope to the quickened life and energies of the Church." The house also declared that, "while we give full weight to the desire that has been expressed for the admission of the faithful laity of the Church of all classes to a substantial share in the control of Church affairs, we still feel that we require to be more fully informed as to the extent to which it is deemed desirable that the laity should share in the administration of the affairs of the Church. We look for valuable information and assistance in this, as in other matters, from the newly constituted House of Laymen. Meanwhile we recommend the formation of voluntary parochial boards or councils, which, we are well aware, have been recommended in many dioceses, and have been in operation in many parishes. It is otherwise as regards parochial boards or councils with defined statutory powers. The formation of

these we can not, as at present advised, recommend until the principles on which they are to be founded shall have been fully considered by the synods of the Church, and shall have received their general approval. It must always be remembered that parochial boards, however constituted, can only properly be regarded as a portion of a still further developed church government. But this development can only be brought about by degrees, and by the steady progress of organized growth. For the present we must be content to endeavor to bring about some measures of united deliberation between the two separate convocations, which would necessarily form the first stage in the organization of that national church council of clergy and laity which is obviously desired by many of the memorialists." The House of Laymen declared its opinion that "any scheme of church patronage amendment, which would directly or indirectly divert any portion of the revenues of a benefit to the advantage of the patron, would be inadmissible, as secularizing the property given to the parish for God's service"; that "the evils complained of in the sale of advowsons can be better dealt with by proper checks and modes of restraint rather than by the prohibition recommended in the draft bill"; and "that all sales of advowsons should in future be conducted by a public diocesan authority, and all other sales be invalid."

The Convocation of York met in York Minster, Feb. 23. The Archbishop of York, in addressing the synod as president, said that in view of the question of the disestablishment of the Church, brought forward at the general election, a number of suggestions of reforms likely to strengthen the Church had been made. They were met, however, with the difficulty that most of these reforms required the aid of Parliament. His belief was that there was more danger from the want of agreement among the parties in the Church as to the required reforms, than from the refusal of Parliament to adopt measures. However that might be, it was their duty to consider reforms. The hands of convocation should be untied; they wanted power to transact business for the good of the Church with the same freedom which other religious and secular bodies enjoyed, subject only to their doing nothing contrary to the laws of the realm. Failing that, the number was likely to swell of those who now said that even disestablishment with freedom might be preferable to establishment with enforced inaction. What was now in their power was to agree upon the reforms required, but they must be tolerably unanimous, and, if they should be refused by the Crown or by Parliament, the question of disestablishment would then have passed into a new and somewhat dangerous phase. How far ought the fear of disestablishment to have an influence over them in dealing with those questions of reform? The outside clamor had

no doubt quickened the national conscience on the subject. Their danger would perhaps be that in framing schemes of reform they might not take sufficient account of the divided state of things in the Church, and of the opposition that might be experienced. The report of the Convocation of Canterbury on Church Reform was concurred in. The lower house approved most of the clauses of the proposed Church Patronage Bill, and requested the president to appoint a committee to report on the best means of securing a due observance of the Book of Common Prayer without resort to the ecclesiastical courts, and of a committee on the details of a proposed House of Laymen.

The Convocation of Canterbury met again May 11. The upper house, considering a letter received from the Bishop of Zululand, asking for guidance on the question of baptizing persons living in polygamy, requested the archbishop to communicate with those churches in the Anglican communion in which questions relating to that subject had been found to be of pressing importance. A report was presented and considered respecting drafts of bills on the method of making changes in the rubrics, which had been under consideration in one shape or another for about twenty years. A committee which had been appointed to consider the question of first fruits and tenths presented a report recommending a further discussion of the subject between the two houses, and was reappointed. The consideration of a draft bill for additional forms of service was referred to a committee of the whole.

The lower house considered and adopted a report on proposals for church reform, which was presented by its Committee on Relations of Church and State. The report began with a reference to what had been attempted during the last fifty years or more in the direction both of church reform and church extension. In every department of church life many great improvements had already been effected, some without the aid of the civil legislature, and others by the authority of statute. With regard to such matters as the restoration of churches, the training of candidates for holy orders, the arrangements for public worship, the increase of services, the education of the poor, the care bestowed on preparation for confirmation, and the frequency of its administration, the exercise of patronage, and the employment of lay agency, the Church had, without going to Parliament, made a wonderful advance. For some of the reforms which had been brought about, the authority of Parliament had been needed. Prominent among them were the erection of new bishoprics. Many acts of Parliament had been passed having for their object the remedy of evils from which the Church suffered. Among them were the Tithe Commutation Acts, the acts under which the Ecclesiastical Commissioners had power to aid the clergy of poor and populous parishes, the Church-Building Acts, and the

Pluralities Acts. The revival of the active functions of convocation was a notable church reform of recent years. The report called attention to the following leading principles as underlying all true church reform: 1. The Catholic faith and Apostolic Order of the Church of England are unalterable, and may not be touched. 2. There is, by divine appointment, a distinction of office between clergy and laity; and the powers intrusted to the laity may not extend to such things as belong to the office of the clergy. 3. The unit of the church's episcopal system is the diocese and not the parish; therefore the parish, the parish priest, and the congregation must be subordinate to the diocesan authority of the bishop. 4. The Church of England is national, not in the sense that the whole nation, as such, may deal, as it will, with the Church's doctrine and discipline, but in the sense that the whole nation has a claim to the administration of its ordinances and the services of its clergy in accordance with that authorized doctrine and discipline, and not otherwise. 5. To the Church's synods, by constitutional right, belongs a legislative power, subject to such sanction of the Crown and authority of Parliament as the authority of the Church and realm require. 6. The right of ecclesiastical patronage is to be primarily regarded as having the character of a trust rather than of a property. 7. The property of the incumbent in the income of his benefice is held subject to the efficient discharge of the duties of the cure. 8. The Church of England, as part of the church of Christ, exists primarily for spiritual purposes.

The report further described the present system of church courts as unsatisfactory, and expressed the belief that a tribunal for hearing appeals to the Crown in ecclesiastical cases must be created, which should do justice both to the Church and to the civil power. One of the most needful reforms was the restoration of the Church's effective voice in ecclesiastical legislation. The long abeyance of the convocations had accustomed the public mind to legislation by Parliament alone, and a claim of legislative power for the Church still seemed strange to many; but such a claim was strictly constitutional, and the full admission of that claim had now become a practical necessity. The Church should be recognized as capable of adapting itself to the varying needs of the time; and Parliament was less than ever qualified, or, indeed, desirous to be the sole legislature for the Church. The power of self-regulation, under proper control, must be restored to the Church. There was no wish to demand independence of the constitutional control of Crown and Parliament; but what the Church had a right to ask was, that greater facilities should be afforded for giving legal effect to the deliberate conclusions of the provincial synods, aided, as they now would be, by the respective Houses of Laymen. The restoration of due legislative power to the provincial synods

would make more necessary an enlargement of the lower house of the Convocation of Canterbury. With an increased representation of the parochial clergy in that house, the occasional united action of the two convocations would become a practical question. The creation of statutory parochial councils was deprecated. Special attention was invited to the importance of strengthening the bishop's authority, by means of a diocesan synod of his clergy or of a council of clergy and laymen, not to share his responsibility, but to aid him by its advice. The house reaffirmed the principles of a bill to provide facilities for the amendment, from time to time, of the rites and ceremonies of the Church which had been agreed upon in 1879; and declared that, while it could not recommend the establishment of parochial councils with statutory powers, voluntary parochial councils summoned by the clergy, and composed of the faithful laity of all classes, might in many parishes be established with advantage—such councils being subject in all matters to the bishop.

In the House of Laymen, the chairman made a statement regarding the functions of the house with respect to petitions. They were not a body to whom a petition could properly be addressed. A resolution was adopted recommending that power should be given to the bishop, acting with the concurrence of his council, to enforce the resignation of incumbents who may be shown to be unfit, for certified causes, to perform the duties of their cures. The bill on church patronage, which the archbishop had introduced in the House of Lords, was approved. The house expressed its desire that the Bishop of Peterborough's bill, relative to seats in churches, might be so shaped as to secure, as far as practicable, the common-law rights of parishioners to the free use of seats in parish churches.

The convocations of the two provinces met, according to summons, at their respective places of meeting, August 6, were formally organized, and were then prorogued.

Conference on Church Reforms.—A public conference, attended by Churchmen and Nonconformists, was held in London, Feb. 24, for the discussion of questions of church reform. Mr. A. Grey, M. P., presided. Attention was called to some resolutions which had been previously adopted at a meeting of conformist and non-conformist ministers; and the chairman, in his opening address, presented as the principles which had induced a junction of men of every party, and had prompted them to stand side by side as the advocates of a reformed national Church of England, first, that the teaching of morality to the people was a proper function of the state; and, second, that the Church ought to be maintained as a national institution, not because it was inseparably connected with any immutable sectarian dogmas or incontrovertible and particular doctrines, but because it was the institution through which, under such con-

ditions as might be imposed by Parliament, the truths of religion were preached to the people. Resolutions were adopted, declaring that "the basis of all true church reform must be found in the recognition of the fact that constitutionally every subject of the state is a member also of the national Church; that for practical purposes the rights thus derived are best exercised by the whole body of parishioners," and that "the parishioners, through their representatives, should be empowered by law to exercise a real control over the appointment of the ministers, the disbursement of the funds, and the arrangement of the services of the national Church in every parish."

Parish Churches Bill.—The Parish Churches Bill, which the Bishop of Peterborough has introduced into the House of Lords, declares in the preamble that, according to the common law of the realm, every parish church in England and Wales is for the free use in common of all parishioners of the parish to which it belongs, for the purposes of divine worship according to the rules and ceremonies of the Church of England. For the remedy of encroachments that have been made on the rights of parishioners "by the appropriation of seats and pews to the exclusion of others, and especially of the poorer classes, to the great hindrance of religion," it enacts that every parish church in the kingdom—saving vested interests, churches built under special local acts, and modern churches possessing legal scales of pew-rents assigned under the Church-Building or New Parishes Acts—shall be free, for the purposes and under the conditions recited above.

Oxford Laymen's League.—An organization of laymen has been formed for contending for the maintenance of the establishment outside of politics. It is called the Oxford Laymen's League for the Defense of the National Church. Its essential principle is defined in its circular to be the union of the religious laity throughout the country without reference to sects or parties; and this point is again emphasized in the words, "Nothing can be more fatal to the Church than its connection with any one political party; its only permanent support is the party of religion." The League proposes by lectures and publications to set facts bearing upon the question of disestablishment before the nation, and to answer the arguments and representations set forth by the advocates of that measure.

Bishop of Edinburgh.—The Rev. Dr. Dowden, Preceptor of the Theological Hall of the Scottish Episcopal Church, was on the 6th of August chosen to be Bishop of Edinburgh, in the place of Bishop Cotteril, deceased.

Church Congress.—The Church Congress met at Wakefield, October 5, and was opened with a sermon by the Archbishop of York. The Bishop of Ripon presided, and, in his opening address, mentioned the subject of church reform as one that would be presented with particular prominence. This subject was

considered under three special aspects, the first of which was that of "Patronage and Endowments—(a) Patrons, their Obligations and Limitations in the Exercise of their Rights; (b) Revenues, their Distribution with a View of increasing the Efficiency of the Church." Canon W. H. Fremantle, of Canterbury Cathedral, considered how the redistribution of incomes would affect church patronage. The other principal speakers on these topics were Canon Lefroy, Mr. Spottiswoode, the Rev. F. F. Goe (Bishop designate of Melbourne), Chancellor Espin, and others. The second branch of the general topic was discussed under the heading of "Church Government and Representation; Convocation, its Reform, Extension, and Powers; and the Position of the Laity in Church Councils," by Prebendary Ainslie, the Rev. S. A. Main Walrond, the Dean of Armagh, Mr. W. H. Houldsworth, M.P., Mr. J. H. P. Lereseche, the Dean of Durham, and Viscount Halifax. The third branch of the subject was considered under the headings "The Clergy; Clerical Efficiency: How best to secure it; Extension of the Diaconate," by Archdeacon Blunt, Mr. James Crotcher, Archdeacon Long, the Rev. C. H. Sale, the Dean of Ripon, and other persons. On the subject of "Christian Evidences," papers were read by the Rev. J. M. Wilson, Prebendary Worlidge, the Rev. J. J. Lias, Archdeacon Hughes Barnes, and the Rev. W. H. M. Hay Aitken. On the subject of "The Church in Relation to the Rural Populations; the Chief Causes of Weakness, and the Best Means of remedying Them," the principal speakers were the Bishop of Liverpool, Mr. Stanley Leighton, M.P., Canon Andrew, and the Bishop of Exeter. The subject of "The Increase of the Episcopate, and the Organization of a New Diocese," was discussed with special reference to the proposed foundation of a new diocese of Wakefield, by the Bishop of Southwell, the Vicar of Wakefield (Rev. Canon Stratton), and other speakers. Concerning "The Church in Relation to State Questions; the Advantage of an Established Church, and the Best Means of instructing all Classes as to its Origin, History, Revenues, and Work," papers were read by Prof. Stokes, Mr. A. E. Miller, and Mr. William Inglis, President of the Workingmen's Church Defense Association. The discussion of the special question with reference to the work of foreign missions, of "How may Difficulties arising from Polygamy, Slavery, and Caste best be met?" was participated in by the Bishop of Exeter, Canon Ashton Mayne, the Rev. T. W. Windley, the Bishop of Zululand, and the Rev. J. Johnson, a native West-African minister. Other questions discussed were, "The Church in Relation to the Urban Populations; how may Lapsed Members be won and the Church's Hold on Members in all Classes be strengthened?"—principal speakers, the Bishop of Rochester, Canon Eliot, of Bournemouth,

Prebendary Hodgkinson, and Mr. J. Trevarthen; "The Uses of Music in the Services of Cathedrals, Town Churches, and Churches in the Rural Districts"—Mr. Walter Parratt, the Rev. Thomas Rogers, Mr. E. H. Turpin, and Mr. Edward Griffith; "The Duty of the Church in Respect to the Homes of the Working Classes, with a View to the Promotion of Morality, Comfort, and Thrift"—Canon Stratton, Miss Mason, Sir W. Worsley, and Archdeacon Emery; "The Education Question, with Special Reference to (a) the Proposal for Free Education, (b) Religious Teaching in Schools of all Grades, and to Adults"—Lord Norton, the Rev. Arthur Carr, Archdeacon Barber, and the Rev. J. Nunn; "The Church in Relation to Social Questions, particularly in Respect to Recreation and Literature"—the Dean of Manchester, Lord Brabazon, and Miss Yonge, of Winchester; and "The Parish Churches Bill." A special meeting for workingmen was held, at which addresses were delivered by the Bishops of Ripon and Manchester; also a meeting for women, and one for delivery of addresses on "The Spiritual Life."

Provincial Synod of Canada.—The Provincial Synod of Canada met in Montreal, September 8. The opening sermon was preached by the Bishop of Algoma. The Rev. John Langtry was elected prolocutor of the lower house. Resolutions inviting co-operation in a movement for Christian union were adopted, to be sent out to other Christian bodies in the Dominion. The use of unfermented wine in the communion was forbidden. The Synod decided that, in order to encourage brotherly feelings between the Church in Canada and the Church of England, the Metropolitan of Canada should send notice of all ordinations to the Archbishop of Canterbury.

ARCHÆOLOGY. (American.) Work of the Peabody Museum.—The eighteenth and nineteenth reports of the Peabody Museum of American Archaeology and Ethnology, the latter of which is dated April 9, 1886, record investigations which were made under the direction, or with the co-operation, of the museum in various parts of the United States and of Central America. For particular and thorough work, the curator chose the valley of the Little Miami river, in Ohio, and the closely associated archaeological region. The three years' work on the large group of mounds and earthworks on Mr. Turner's farm, near Madisonville, was brought to completion in 1885. A special report is given of the exploration of a mound on the farm of Mr. Benjamin Marriott, adjoining Mr. Turner's, which yielded many objects of interest, including some exhibiting skill in workmanship. Besides two or three thousand broken and split pieces of bones of animals, river-shells, a part of a clam-shell, and pieces of mica, there were found needles of bone; awls of bone, one of which was ornamented with rows of fine cross-cut lines; flaked knives; handles of antler, two of which held points,

one of bone and one of chipped stone; bear's teeth, some showing perforations and some containing insertions of pearl; breast-ornaments and ear-ornaments of copper; and parts of human skeletons. Some new objects having been discovered in one of the mounds in the Scioto Valley, near Chillicothe, a brief examination was made of that site. Among the specimens obtained there were two copper celts, some copper plates, and several copper ear-ornaments, some of which were covered with meteoric iron like a few of those in the Turner mounds, and a celt made of meteoric iron. These discoveries are regarded as furnishing an important link connecting the people who built the earthworks in the Scioto Valley with the builders of the group on the Turner farm in the Little Miami Valley. A large cemetery was explored on the opposite side of the Little Miami river from the ancient cemetery, near Madisonville, which had already been explored, and from it were obtained many thousand specimens and several skeletons. Among the specimens were large pipes cut in stone in the form of human figures, examples of which had hitherto only been found on the surface, now for the first time met associated with skeletons. These pipes had been attributed to the people who made the mounds in the Ohio Valley, but, the curator says, "now we know that they belonged to a people who buried in regular and large cemeteries, where the bodies were generally placed in extended postures. We also," the report continues, "have obtained facts indicating burial ceremonies, which, with the many objects associated with the human remains, will permit us to draw a fair picture of the arts and customs of this particular people, who need no longer be confounded with those who built the altar-mounds, stratified mounds, and large earthworks in the valley." An examination was made of some mounds on the bluffs of the Mississippi river, in Atlas township, Pike county, Ill., and also of some mounds in Calhoun county, along the bluffs of the Illinois. The most important result of this work was, in its leading to the formation of an opinion that the mounds on the Illinois bluffs were not made by the same people who built those on the Mississippi bluffs in Pike county. "In the latter, few if any objects of an imperishable character were placed with the dead. In the former have been found pottery of an exceptionally fine character; elaborate ornaments of shell, stone, and copper; pearl, shell, and copper beads; and implements made of bone, stone, and copper. From all I can learn of the burial-mounds of the Illinois bluffs," says Mr. Putnam, the curator of the museum, "they resemble in contents, size, and structure the simple burial-mounds of the Ohio Valley, while those on the Mississippi bluffs have nothing in common with them except that they are burial-mounds." Dr. C. C. Abbott, in his examinations of the gravels at Trenton, N. J.,

besides recovering several interesting palæolithic implements from various depths, found a part of a human under jaw sixteen feet below the surface, not far from where a piece of the tusk of a mastodon or mammoth had been found several years previously. The museum has received from Dr. Flint, in Nicaragua, four blocks of tufa containing human footprints, which had been found under several layers of volcanic material, on the shores of Lake Menagua, in that country. Dr. Flint had also furnished the museum with a number of ornaments in jade, one of which, when compared with a cup of the same mineral from Pekin, in China, proved to be like it in color, hardness, and specific gravity. No place is known where jade is found or has been found *in situ*, except in China; and the distribution of ornaments of that mineral in prehistoric sites all over the world is held, in the absence of evidence to make any other supposition plausible, to imply that some kind of intercourse existed in the age to which the remains belong. Some of the ornaments in question had been made from celts by cutting them into halves and quarters, and still exhibited parts of the cutting edge of the original implement. This implies, at least, that the supply of jade was not abundant, else the ornaments would have been made from fresh stones, and not by cutting up tools which already had considerable value.

Animal-Mounds in Wisconsin.—Dr. Stephen D. Peet, of Wisconsin, has made a study of the prehistoric earthworks around Delavan Lake, and calls attention to the fact that the ridges at Lake Lawn, which have not been observed to have any particular form, really conceal a variety of symmetrical figures. The plotting of them, he says, has revealed the fact that they are in the shape of birds, turtles, and other creatures, and that many of them were originally very accurate imitations. He has discovered at least ten bird effigies in this one group; but there are several effigies which have been obliterated. Thirty-seven of these forms are here found within the space of ten acres, and so close together as to make the ground extremely rough. The size of the mounds varies from fifty to a hundred and fifty feet in length, and from thirty to fifty feet in width.

Mounds in Manitoba.—Mr. C. N. Bell, of Winnipeg, read a paper in the British Association on the sepulchral mounds of the Canadian Northwest, in which he showed that there is a continuous line of mounds from the mound-centers of the Mississippi river, down the Red river, to Lake Winnipeg. Human remains, much decayed, were found in the mounds, all buried by being placed on the surface under heaps of earth in which patches of ashes and charcoal frequently occurred, but no remains of funeral feasts were found. Indians, when first met with, buried weapons with their warriors, but none were found in these mounds, although implements and ornaments of shell,

bone, and stone were common, as well as pottery, which was unknown to the Indians of Northwest Canada on the arrival of white immigrants. One mound had a floor of burned clay and bowlders, similar to the sacrificial mounds and altars of Ohio. Ornaments were found made of sea-shells, which must have been carried 1,200 miles.

The Maya Inscriptions.—Dr. Augustus Le Plongeon, who has spent several years in archaeological research in the ruined cities of Yucatan, believes that he has discovered the key to the Maya hieroglyphics, and that he is able to give correct interpretations, having definite historical significance, to the figures, carvings, and inscriptions which are found on the monuments. In a paper which she read before the New York Academy of Science, Mrs. Le Plongeon described the "Governor's House" at Uxmal, with twenty rooms, and another building near it, having 102 rooms, with ceilings composed of stones overlapping so as to form a triangular area, and their elaborate ornamentation of mastodons' heads and feathered serpents. One series of designs was interpreted as recording the history of the foundation of the city, with the names of the founders. Traces of paint were found in one of the courts, and impressions of hands that had been dipped in red paint and pressed against the walls as a religious invocation. In a building at Chichen-Itza were observed several figures in profile of men having long beards; and in another building in the same city mural paintings representing religious ceremonies, domestic scenes, and battles, the figures of which for skill in execution were compared with the best works of ancient Egyptian art. A mausoleum was adorned with sculptures of macaws and leopards, and a leopard-sphinx, and contained a large statue, two funerary urns, and articles in jade, chalcedony, and greenstone. The statue was drawn out from the tomb, but was afterward taken possession of by the Mexican Government.

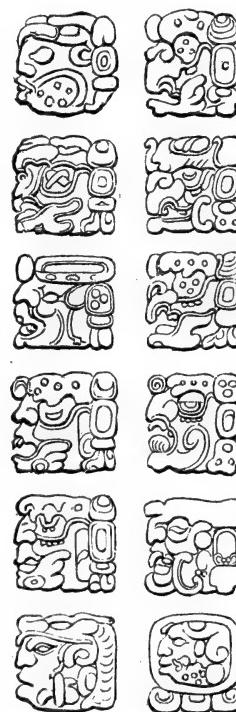

Dr. Daniel G. Brinton relates in the "American Antiquarian" that Mrs. Zelia Nuttall Piñart, who is acquainted with the Nahuatl language, has succeeded in reading the ancient Mexican picture-writing; and he adds to his announcement that "the results she has obtained cast an entirely new light on ancient Mexican history and social life, and her conclusions, if established, will deal a severe blow at most of the prevailing theories regarding the government, religion, and mythology of the Aztec and allied tribes."

The Ruins of Quirigua.—Mr. A. P. Maudsley has published an account of his excavations of the ruins of Quirigua, which are situated on the river Montagua, in Central America. They consist of numerous square or oblong mounds and terraces, varying from six to forty feet in height, usually faced with worked stone, and ascended by flights of stone steps. The most interesting objects are thirteen large monoliths

arranged irregularly around a kind of plaza. Six of these are tall stones, from three to five feet square, and standing from fourteen to twenty feet out of the ground; the other five are shaped so as to resemble huge turtles or armadillos. All the monuments are covered with elaborate carvings, including huge human figures on the tall monuments; tables of hieroglyphics; and squares or cartouches of picture-writing, in which grotesque figures of men and animals appear prominently. The human figures are conventional, the picture-writing designs relatively free. Usually most of the designs, even in what appears to be purely conventional scroll-work, may be found, on careful examination, to be derived from the representation of a face. No figures derived from leaves or flowers have been observed, but a plaited ribbon is occasionally employed, and free use is made of plumes of feathers; and these are often very gracefully arranged and beautifully carved. The fifteen monuments are divided into two groups, in one of which the human figures are all of men, and in the other all of women. Mr. Maudsley calls attention to the fact, as showing an advanced and peaceful condition of existence in the people

who built this city, that representations of weapons of war are entirely absent from all the monuments. Casts of many of the objects described have been placed in the Archaeological Museum at Cambridge, England.

The Monuments of Copan.—Mr. Maudsley has made a systematic examination, with surveys and measurements, of the principal ruins of the city of Copan, which were described by Stephens in 1840. He believes that the nature of the structures has been in some points mistaken; that the so-called pyramids are the raised foundations that supported roofed buildings, and that these were approached by steep flights of

INSCRIPTION FROM COPAN.

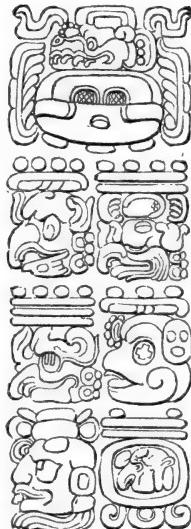

steps; that the long heaps of stones which were taken to be the ruins of city walls are, in fact, the remains of single-chambered stone-

roofed houses, and that the great "river-wall" is a wall only in appearance, and is the result of the river having eaten into the terraces and foundations of the east side of the ruins, where the plan of the structure was originally the same as on the other sides. The excavations yielded, among objects of interest, a few worked stones, including some beads and a whorl of jade, pearls, and carved pieces of shells, a pot containing a red powder and several ounces of quicksilver, human bones, dogs' teeth, and jaguars' skeletons, parts of one of which were painted red. From the fact that the Spaniards failed to make any mention of the cities the ruins of which are now attracting attention, or of anything like them, and that the settlements they did speak of are unlike these, Mr.

Maudsley draws the conclusion that the sites had been deserted and the buildings buried in the forest long before the conquest. In examining the sculptured ornaments and hieroglyphics, a profusion of which is characteristic of Copan, the author was struck with the frequency of the occurrence of the serpent-symbol, usually the plumed serpent. It appears in the scroll-work; is often found in connection with a natural or more or less grotesque human head; and occurs under various disguises. A curious feature in the inscriptions, which the author believes should be read in double columns, from left to right, downward, is that all those which appear complete from the beginning, are headed by an initial scroll, and begin with the same formula, usually extending through six squares of hieroglyphic writing. The sixth square, or sometimes the latter half of the sixth square, is a human face, usually in profile, inclosed in a frame or cartouche.

Babylonia and Assyria. The Wolfe Expedition to Babylonia.—The report of the Wolfe Expedition to Babylonia has been published in the papers of the Archaeological Institute of America. The expedition consisted of W. Hayes Ward, D. D., in charge; Mr. J. H. Haynes, of Robert College, Constantinople; and Dr. J. R. S. Sterrett, who had been engaged with the explorations of the Institute in Asia Minor. The expedition was intended to make a preliminary examination of Chaldea during the winter months, and investigate the practicability of further excavations there. A firman was ob-

tained from the Turkish Government authorizing the visitation of the country, but forbidding all excavations. After leaving Constantinople the party visited the American mission at Marath, in the vicinity of which are several ruined Hittite towns and Hittite inscriptions; and Jerablus, on the Euphrates river, the site of the old Hittite capital, Carchemish. At Arslan Tash, not far from Birejik, two enormous lions in black basalt were found and photographed, and a prostrate bull was found. Proceeding to Bagdad, the expedition visited Mosul, Koyunjik (Nineveh), Khorsabad, and Nimrud, places which had been the scenes of explorations by Layard, Botta, and Place, and Erbil, the Arbela of ancient history, while it also passed numerous mounds which have not been opened. From Bagdad it went to Babylon and Hillah, on the way visiting Abu-Habba, the site of the ancient Sippara of Shamash, which had been explored by Mr. Rassam. While at Hillah it visited Birs Nimrud, the ancient Borsippa, and the traditional site of the Tower of Babel. From Hillah the expedition started, on the 21st of January, 1885, on a journey through the country to the south of Babylon, lying between the Tigris and Euphrates rivers, which no American traveler had ever traversed, which had not been visited by any European traveler for thirty years, and parts of it never. Numerous mounds were observed all through the region, only a few of which have been identified. Among them were Niffeh, the Nipur of the inscriptions, and probably the Calneh of Genesis, one of the oldest and most important cities in Babylon; Tello and Zergbul, where the French explorer, M. de Sarzac, had made some discoveries of great value, and Warka, the biblical Erech. A second visit to Abu-Habba, after his return to Hillah, satisfied Dr. Ward that that mound was the Sippara of Shamash; but he could find nothing pointing to the existence at that place of the older Sippara of Anunit, or Agade, which archaeologists had associated with it. He heard, however, at Saklanich, on the Euphrates, of a large mound called Anbar, which, on visiting it, proved to answer well to the descriptions which have come down of the situation, shape, and dimensions of the ancient capital. "The discovery of this city," Dr. Ward says, "which represents the Agade, or Sippara of Anunit, the Accad of Genesis x, 10, the Persabora of classical geographers, and the Anbar of Arabic historians, is of the first importance. It is easy to trace the lines of the old palaces or temples, not through any stone walls, but by the depression of the courts, now cultivated wheat-fields. In various places the brick masonry of buildings and walls could easily be traced." At Palmyra, which the expedition visited on the return home, nearly a hundred views were taken, and squeezes of most of the inscriptions, including the immense stone recently discovered, containing the law of tolls for caravans.

INSCRIPTION FROM COPAN.

An immense field for exploration and the recovery of historical material relating to the extremely ancient empires of Babylonia was observed, of which only Birs Nimrûd, Abu-Habba, and Tello have been explored with any thoroughness, while most of the sites, including two of the great cities, have not been touched. Dr. Ward also recommends the careful exploration of the courses of the old chief canals, which were so large as to bear the name of rivers.

Assyrian and Babylonian Antiquities in the British Museum.—The Assyrian and Babylonian antiquities in the British Museum, including those which were discovered by S. H. Layard at Nimrûd in 1847-'51, the collections obtained by George Smith and Mr. Rassam, and the objects presented by the proprietors of the London "Daily Telegraph," have been arranged in a separate gallery. The collection of inscribed terra-cotta tablets, representing Babylonian literature, illustrates a period more than 2,000 years long, extending from b. c. 2500 until less than a century before the Christian era. An important section of the collection is that which contains the monuments and inscriptions from Chaldea, the greater part of which are the results of Mr. Rassam's explorations at Abu-Habba, the ancient Sippara, and in the Birs Nimrûd, the ancient Borsippa. In this section many branches of literature are represented: history, by portions of a canon of kings with dynastic summations and fragments of narrative; poetry, by hymns and legendary tales; mythology, by fragments of the deluge tablet from the library of the Temple of Nebo at Borsippa; astrology and astronomy, by calendars, eclipse tablets, and omen tablets; and mathematics, by tables of square and cube roots, and abstruse calculations of a cabalistic character. The literature of every-day life is illustrated by a series of commercial tablets and memoranda, ranging from the reign of Eriaku, the Arioch of Genesis xiv, the contemporary of Abram, till b. c. 93, and letters, notes, and copy-books of school-boys and scribe students. The section exhibits, in a striking manner, the popular and spontaneous nature of the Chaldean literature, in contrast with the exotic and formal character of Assyrian literature, which was largely indebted to royal patronage for its maintenance. Evidences also appear in it of the care with which ancient documents were preserved, and the fidelity with which they were restored or copied if there was danger of their falling into decay or being lost. The existence of bilingual populations is indicated by the presence of tablets, some of which are written in Semitic Babylonian, and others in the agglutinative Accadian or Sumerian. A bi-lingual royal inscription of Khammorabi, in which the two versions are placed side by side, shows that these elements were co-existent. In the tablets of the Egibi firm of bankers at Babylon, which cover several centuries, the occurrence

of Assyrian, Persian, Greek, Hebrew, and Egyptian names, besides Babylonian names, shows the extent and variety of the intercourse which this people had with other nations.

Persia. The Palaces of Darius and Artaxerxes.

M. Dieulafoy, with a French commission, has been conducting excavations in Susiana. The principal object of the excavations in 1885 was the palace of Artaxerxes Mnemon. The aim of the work done in 1886 was to lay open the foundations of a palace beneath the other, which had been built by Darius, and had been destroyed by fire before the time of Artaxerxes. In the midst of these foundations was found, in perfect preservation, a frieze in bas-relief, enameled in colors, 11·80 metres in length and 3·60 metres in height, representing twelve soldiers of the royal guard in the garb and bearing the arms assigned by Herodotus to the ten thousand immortals. The figures are 1·41 metres in height, and are shown in profile. Their faces, feet, and hands are black. The examination of the skeletons found on the site makes it appear that the early population of Susiana must have belonged to a black race—not negroid, but resembling the present inhabitants of the coast of the Red Sea. In the same neighborhood were found fragments of sculptures on baked bricks. The subjects are winged lions and bulls, taken from the mythical fauna of Chaldea, but treated with remarkable freedom of style. In the excavations on the site of Apadana, the hall of the throne has been cleared throughout and its plan accurately determined; and it was possible to reconstruct a magnificent two-headed capital, supported upon four rows of volutes. Its size was 4 mm. 10 by 5·24 mm., and it weighed more than 30,000 kilogrammes. It has been removed to Paris, together with a part of the sculptured base. Diggings conducted in the neighborhood of the royal tumulus brought to light a small building of the Achæmenid period which M. Dieulafoy considers a temple. If so, it must be of later date than the time of Darius and Xerxes, for the Persians had no temples then. Among the principal objects discovered were funeral urns, molded around the bodies of the dead and baked with them, which were found by hundreds, deposited in galleries excavated in the thickness of the walls, bronze coins, jewelry of copper, utensils of earthenware and metal, and lachrymal vessels of glass, mingled with ashes, which were likewise found in the galleries. The Museum of the Louvre has acquired a large number of enameled vases, arms, lamps, statuettes, a new collection of cuneiform tablets, and nearly three hundred engraved stones, including ninety-seven fine cylinders. The commission also brought back a plan of the tumulus and environs of Susa, many photographs and rubbings, and collections in natural history and geology.

Palestine. Remains of an Aqueduct at Jerusalem.

—In studying a section of an aqueduct which was discovered in 1880, in connection with a

Hebrew inscription ascribed to the age of Hezekia, in the tunnel connecting the Virgin's well with the pool of Siloam, Sir Charles Wilson formed an opinion that there might have been another and older aqueduct connecting the two fountains. Such an aqueduct has been discovered by Herr Schick, at three points where he sunk shafts. It is roughly hewn in the solid rock and covered with slabs, where it is not filled with mud and rubbish. No inscription has yet been found upon it. It is supposed to be as old as the time of Solomon.

Egypt. Egypt Exploration Fund.—At a special general meeting of the supporters of the Egypt Exploration Fund, held in London July 6, the chairman laid on the table the first part of the society's forthcoming publication on the excavations and researches at Naukratis, and pointed out that of the five great temples mentioned by the Greek literary authorities four had now been discovered, two in the present season and two in Mr. Petrie's previous explorations. This year the cemetery had also been found, but the part of it that could be excavated contained only the graves of a later period, whereas the best time of Naukratis was the sixth century b. c. These graves contained coffins of tile and of wood, the latter decorated with terra-cotta ornaments, gorgoneia, etc., many of which had been recovered. The burials were always after the Greek customs, and no traces of embalming had been found. In the *temenos*, or shrine of the Dioscuri, the plan of a temple built of unbaked brick, faced with plaster, had been recovered. In front of it were pillars of the same materials. The Temple of Aphrodite consisted only of mud-brick walls, inclosing one, or, in the earlier temple, two chambers. In front of it was a great altar, built of ashes, held together with a mud-brick casing. The yard of the temple was covered with a layer of fragments which had yielded a great number of vases and statuettes, more or less perfect. These were all of an early period, and many were inscribed in the characters of the sixth century b. c. The *temenos* of the Samian Hera had also been found, but had not been rich in results. Some smaller articles had been found in the town, including a beautiful portrait-head of the period of Berenike II, in blue porcelain. It did not seem advisable to continue the work at once, as no result might ensue, but rather to watch the site till fresh remains were uncovered by the Arabs. Up to the present moment much had been gained. A most valuable series of inscriptions served, not only to throw light on the early history of the Greek alphabet, but also to decide the age of many classes of vases and sculptures whose date had previously been matter of conjecture. By ascertaining the real nature and importance of the colony of Naukratis, its position in history was established. It was merely a trading emporium, but owing to the surroundings that prevented its growing in size or prosperity, its

art and handicrafts were stimulated by emulation. Its influence on Greece in the sixth century must have been of great importance.

Excavations at Tell Nebesh.—The excavations of the Egypt Exploration Fund were resumed in the Delta at the beginning of the season of 1885-'86, under the direction of Mr. W. M. Flinders Petrie, Mr. F. Llewellen Griffith, and Mr. Ernest A. Gardner. Leaving Mr. Gardner to pursue the investigations at Naukratis, Mr. Petrie and Mr. Griffith proceeded to make excavations at a new site in the neighborhood of Tanis. The mound at which they worked is called variously, Tell Nebesheh, after the name of the village, Tell Bedawi, or the mound of the Bedouin, and Tell Farun, or the mound of the Pharaoh. It is the site of a vast and very ancient cemetery, the level of which has been raised from age to age by successive strata of interments. Besides the cemetery, the mound contains the remains of two ancient towns and the site of a temple. The temple occupies the eastern extremity of the mound, and was formerly surrounded by a sacred inclosure about 600 feet square. The line of the walls can still be traced. Near the northeast corner stands the remains of a monolithic shrine in red granite, fourteen feet high by nearly eight feet wide. At the northern end of the mound is a broken sphinx in black granite, which appears to belong to the Hyksos period. The cemetery is very unlike the cemeteries of Memphis, Thebes, and Abydos, and is described by Mr. Petrie as consisting of "an immense number of small chambers, or groups of chambers, placed isolated and irregularly all over a sandy plain. These were built of unbaked brick, and roofed with barrel-vaulting. Some were larger, and cased or lined, if subterranean, with limestone. In later times—in the sixth century b. c., and after—large blocks of about a dozen chambers became frequent. These tombs have nearly all been pilaged in early times, so that in a hundred only half a dozen bodies have been found; and not only did the chambers fall to decay, but they were leveled and others built on them, so that three or four successive occupations of the same ground may be traced." In some of the vaults quantities of bones were found indiscriminately piled. Among other monuments and relics are a black granite altar of the reign of Amenemhat II of the twelfth dynasty, much sealed by the action of the salt in the soil, bearing an erased inscription of a "royal friend, seal-bearer, and chancellor"; two thrones of life-size royal statues of the twelfth dynasty, much mutilated; a limestone statue dedicated apparently to Harpocrates; a fragment of a statue of Ptah in black granite, highly polished, bearing an inscription of Rameses II; several sculptured blocks of some building earlier than the temple; and a headless sphinx, in black granite, supposed to be originally of the twelfth dynasty, on which the cartouches of successive kings have been in

turn inscribed and erased. Tombs of the twentieth dynasty have yielded great numbers of small articles. Two sets of foundation deposits were found in the corners of an unimportant building in the cemetery, which, in connection with the foundation deposits found in the previous year at the Ptolemaic building in Naukratis, prove the prevalence of the custom of making such deposits.

The Royal Palace at Tahpanhes.—Mr. Petrie spent the last two months of the season of work on the hitherto unexamined site of Tell Defenneh, the Tahpanhes of the Bible (Taphne in the Septuagint) and the Pelusiac Daphne of the Greeks. The site has considerable intrinsic importance as being that of the earliest Greek town in Egypt, and as being a site of the twenty-sixth dynasty, wholly free from later remains. The "Pelusiac Daphne" of Herodotus was one of the important parts in the district of Stratopeda, in which Psammeticus I settled the Carian and Ionian mercenaries, by

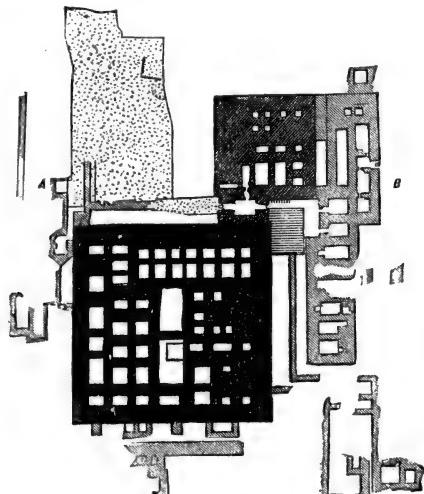

tion, by a large stela recording the garrison stationed there, and by the arms and armor found in the camp around it. It was proved to have been constructed by Psammeticus by the foundation-deposits, consisting of a variety of articles, with plaques of metal, stone, and porcelain under each corner, bearing the name of that king. Other discoveries indicated that it was also used as a small palace or hunting-box. The whole is inclosed within an immense walled area, 3,000 feet long by 1,000

SECTION OF RUINS OF PALACE OF TAH PANHES.

feet broad, having a north gate opening upon the Pelusiac Canal, and a south gate toward the ancient military route between Egypt and Syria. The great boundary-wall was 50 feet thick. Among the objects found within the building were "much fine pottery of the twenty-sixth dynasty; bronze and iron work; delicately made scale armor of iron, six laps thick, and yet not over-heavy; invaluable plaster jar-sealings, with royal names which date the finds; and, perhaps most important, baskets, sacksful of the finest painted Greek vases, all thrown away, broken up, in two or three rubbish-rooms, and all dated, more nearly perhaps than any other find of vases, by jar-lids of Amasis, who removed the Greeks and stopped their trade early in his reign. We know for certain that this great layer must belong to within a few years after 570 b. c., but all the most striking pieces are of a style and coloring as yet wholly unknown in the British Museum collection, and, stranger still, quite different from the characteristic Naukratian pottery. Only two bits of the commonest types of Naukratis were found in the whole work. Naukratis and Defenneh did not bring their pottery from a common source, nor from any sources as yet known to us. The inference is that each style is that of the place in which we find it, and is not imported at all."

Outside of the buildings of the Kasr, Mr. Petrie found an area of continuous brick-work resting on sand, about 100 feet by 60 feet in dimensions, facing the entrance to the later buildings at the east corner. It has no traces of chambers, and seems to have been an open-air place for out-door purposes, and "such as even poor villagers make before their houses, leveling a smooth, hard bed of mud, which they keep clean swept." The existence of this pavement and its exact location threw a remarkably clear light upon a passage in Jeremiah xlivi, where the prophet, having described the removal of Johanan and the captains of the forces, "men, and women, and children, and the king's daughters," etc., to Tahpanhes, relates, as it is translated in the Revised Version: "Then came the word of the Lord to Jeremiah in Tahpanhes, saying, Take great

PLAN OF THE PALACE OF TAH PANHES.

whose aid he had gained his throne, and was one of the three great fortresses which he established as a defense against the Arabians and Syrians. The city also played an important part in one of the transactions mentioned by the prophet Jeremiah (chs. xxxvii-xlvii). The mounds consist of three groups, situated from a quarter of a mile to a mile apart, while the intermediate ground is covered with potsherds, stone chips, and the remains of brick foundations. The largest of the mounds is composed of the blackened ruins of a huge pile of brick buildings, visible from a great distance across the plain, and which the Arabs told Mr. Petrie was called "El Kasr el Bin el Yahudi," or "The Castle of the Jew's Daughter." This building, which formed the chief object of attention, was identified as a fort by its construc-

stones in thine hand, and hide them in the mortar of the brick-work which is at the entry of Pharaoh's house in Tahpanhes, in the sight of the men of Judah; and say unto them, Thus saith the Lord of hosts, the God of Israel: Behold, I will send and take Nebuchadnezzar the king of Babylon, my servant, and will set his throne upon these stones that I have hid; and he shall spread his royal pavilion over them. And he shall come, and shall smite the land of Egypt" (verses 8-11). The Revised Version gives as an alternative reading for "brick-work," "the pavement or square," in the light of which Mr. Petrie remarks that the area he discovered would be exactly the place where Nebuchadnezzar would spread his royal pavilion. Search was made for the stones mentioned, but identification of them was found to be impossible, for the rains have washed away the area and denuded the surface, so that, although it is two or three feet thick near the palace, it is reduced in greater part to a few inches, and is altogether gone at the northwest corner. No definite record has been found of Nebuchadnezzar's having fulfilled Jeremiah's prediction, that he would spread his pavilion on that spot. Egyptian inscriptions say that he came, and was defeated by Apries; Babylonian inscriptions say that he conquered. Three clay cylinders of Nebuchadnezzar, such as he was accustomed to use for marking the places where he planted his standard and throne, are preserved in the museum at Boolak. There is said to be reason to believe that they were found in this place a few years ago, although the Arabs who sold them to the museum said that they came from Tussin, in the isthmus. Within the Ksar were found the kitchen offices, with various articles and conveniences for kitchen use, including the sink, which, according to Mr. Petrie's description, "is formed of a large jar with the bottom knocked out, and filled with broken potsherds placed on edge. The water ran through this, and thence into more broken pots below, placed one in another, all bottomless, going down to the clean sand some four or five feet below." Several other drain-sinks of similar construction were found. Beyond the camp-wall were the remains of a wide settlement, strewed with fragments of pottery and pieces of jewelry. About 1,600 weights were collected, besides which some 800 weights had previously been found at Naukratis.

M. Maspero's Report of his Work.—M. Maspero, giving a report to the "Académie des Inscriptions" of the year's archaeological work in Egypt, spoke of the success of the new plan adopted by the authorities of the Boolak Museum of allowing to the finders the benefit of half of all that they discover. The effect of the measure is to interest the people in the search for antiquities and to secure reports of everything of interest that is found. A rock has been discovered near Akmin which contains some ten or twelve thousand inscriptions,

of hunters of all races—Egyptian, Phœnician-Greek, Roman, and Arab, who were accustomed to resort to that region from the sixth dynasty down to the present time. The excavations at Luxor have been continued, in the face of difficulties in effecting the expropriation of the building that encumbers the site of the temple. The removal of the sand around the sphinx has been undertaken. Although nothing was to be seen of this structure except the head and neck, the figures of it on the old Egyptian monuments show the entire body down to the paws, and a large square plinth beneath, covered with ornaments. It has been generally supposed that the sphinx was hewn out of a large isolated rock which overlooked the plain; but M. Maspero has found it to be of a yet more stupendous character. It has been shown to occupy the center of an amphitheatre, forming a kind of rocky basin, the upper rim of which is about on a level with the head of the figure. The walls of this amphitheatre wherever visible are cut by the hand of man. It seems probable, therefore, that in the beginning there was a uniform surface of rock in which an artificial valley has been excavated, so as to leave in the middle a block out of which the sphinx was finally hewn. During the winter's work of 1885-'86, the sand around the sphinx was lowered by about thirty metres.

The Mummies of Rameses II and III, Sekenen-ra and Seti I.—On the 1st day of June, M. Maspero, Director-General of the Excavations and Antiquities of Egypt, by order and in the presence of the Khedive, assisted by a number of Egyptian and European officers, unbandaged the mummy of Rameses II, which had been found in 1884, together with mummies of other kings, princes, and princesses of ancient Egypt, at Dayr-el-Bahari, near Thebes. The identity of the mummy was attested by the official entries bearing dates of the reigns of the high priests under whom they were made, written in black ink upon the lid of the wooden mummy-case, and by a further entry written upon the outer winding-sheet of the mummy over the region of the breast. After removing two or three layers of bandages there was found a piece of fine linen reaching from the head to the feet, on which was drawn a figure representing the goddess Nut, one metre in length, in red and white, as prescribed in the ritual. "The profile of the goddess," says the official report of the process, "is unmistakably designed after the pure and delicate profile of Seti I, as he is known to us in the bas-relief sculptures of Thebes and Abydos. Under this amulet there was found another bandage; then a layer of pieces of linen folded in squares and spotted with the bituminous matter used by the embalmers. This last covering removed, Rameses II appeared. The head is long, and small in proportion to the body. The top of the skull is quite bare. On the temples there are a few sparse hairs, but at the poll the hair is quite thick, forming smooth, straight

locks about five centimetres in length. White at the time of death, they have been dyed a light yellow by the spices used in embalmment. The forehead is low and narrow; the brow-ridge prominent; the eyebrows are thick and white; the eyes are small and close together; the nose is long, thin, hooked like the nose of the Bourbons, and slightly crushed at the tip by the pressure of the bandages. The temples are sunken; the cheek-bones very prominent; the ears round, standing far out from the head, and pierced like those of a woman for the wearing of earrings. The jaw-bone is massive and strong; the chin very prominent; the mouth small but thick-lipped,

the living king. The expression is unintellectual, perhaps slightly animal; but, even under the somewhat grotesque disguise of mummification, there is plainly to be seen an air of sovereign majesty, of resolve, and of pride. The rest of the body is as well preserved as the head; but, in consequence of the reduction of the tissues, its external aspect is less life-like. The neck is no thicker than the vertebral column. The chest is broad; the shoulders are square; the arms are crossed upon the breast; the hands are small and dyed with henna; and the wound in the left side, through which the embalmers extracted the viscera, is large and open. The legs and thighs are fleshless; the feet are long, slender, somewhat flat-soled, and dyed, like the hands, with henna. The corpse is that of an old man, but of a vigorous and robust old man. We know, indeed, that Rameses II reigned for sixty-seven years, and that he must have been nearly one hundred years old when he died."

Maspero next proceeded to unbandage a mummy which had been found, together with another mummy, in a very dirty and tattered condition, in a sarcophagus that bore the name of Nofretari, the wife of King Ahmes I, of the eighteenth dynasty. The latter mummy proved, on beginning to unroll it, to be much decayed and very offensive, but was ascertained to be the corpse of a woman of mature age and middle height, of the white race. There were no traces of writing on the bandages, but a strip of linen discovered in the sarcophagus was decorated with a scene of adoration of King Rameses III. The other mummy bore no outward inscription, but had on the head a linen band covered with mystical figures. The orange-covered winding-sheet of this one being removed, there appeared beneath it a white sheet bearing an inscription in four lines: "The year XIII, the second month of Shomon, the 28th day, the first Prophet of Amen, Pianki, the scribe of the temple Zoseron-Khonsu, and the scribe of the necropolis Boutchamon, proceeded to restore the defunct king Ra-user-ma Mer-Amen, and to establish him for Eternity." The mummy which had hitherto been taken for Nofretari was, then, the mummy of Rameses III; and the anonymous mummy was, without doubt, that of Nofretari. As the unbandaging proceeded, some of the wrappings appeared inscribed with legends and groups in black ink, some of them in the form of offerings. Two pectoral ornaments were laid in the folds of the wrappers, one of gilt wood, bearing the group of Isis and Nephthys adoring the sun, and the other, in pure gold, inscribed with the name of Rameses III. The face of the king was coated with a compact mass of bitumen, which hid the features, and had to be removed. On re-examining the bandages, inscriptions of the high-priest, Pinotem I, were found on two of them. The pitch having been removed from the face, the features were found to be less well preserved than

THE MUMMY OF RAMESES II.

and full of some kind of black paste. The paste being partly cut away with the scissors, disclosed some much-worn and very brittle teeth, which, moreover, are white and well-preserved. The mustache and beard are thin. They seem to have been kept shaved during life, but were probably allowed to grow during the king's last illness; or they may have grown after death. The hairs are white, like those of the head and eyebrows, but are harsh and bristly, and from two to three millimetres in length. The skin is of earthy brown splotched with black. Finally, it may be said the face of the mummy gives a fair idea of the face of

those of Rameses II, "yet they can to a certain extent be identified with those of the portraits of the conqueror. The head and face are closely shaved, and show no traces of hair or beard. The forehead, without being lofty or very broad, is better proportioned and more intellectual than that of Rameses II. The brow-ridge is less prominent, the cheek-bones are less high, the nose is less hooked, the chin and jaw are less heavy. The eyes appear to be larger, but it is not possible to be certain of this last point, the eyelids having been removed, and the cavities of the eyeballs having been stuffed with rags. The ears are closer to the head than those of Rameses II, and they are pierced in like manner for the reception of ear-rings. The mouth is disproportionately wide, and the thin lips reveal a row of white and well-placed teeth. The first molar on the right side appears to have been broken, or to have been worn away earlier than the rest. In short, Rameses III is like a smaller imitation of Rameses II. The physiognomy is more delicate, and, above all, more intelligent, but the height of the body is less, the shoulders are less wide, and the strength of the man was inferior." Rameses III was also a warrior, but his wars were not aggressive; they were waged at home, in defense of the kingdom. The two mummies, replaced in their glass cases, will henceforth be exhibited in the museum at Boolak.

The communication of the report of the unbandaging of these mummies, June 3, was M. Maspero's last official act. He resigned his office on the 5th of June, for reasons relating to the health of Madame Maspero. He was succeeded in the superintendency of excavations and archæology by M. Eugène Grébaut.

On the 9th of June, M. Eugène Grébaut, assisted by M. Maspero and the officers of the Museum of Boolak, unbandaged the mummy of Sekenenra Ta-aken, the Theban king of the seventeenth dynasty, under whom the war was waged against the Shepherd kings, which resulted in their expulsion. This king is one of the heroes of a very ancient legendary romance written on papyrus in the hieratic character of the time of the nineteenth dynasty, of which a large fragment is in the British Museum. The identity of the mummy was established by means of the inscription, written in red ink and retouched with the brush, upon the cover of the mummy-case. Upon exposing the body, the head was found thrown back, and lying low to the left. A large wound running across the right temple a little above the frontal ridge was partly concealed by long and scanty locks of hair. The lips were wide open, and contracted into a circle, from which the front teeth, gums, and tongue protruded, the latter being held by the teeth, and partly bitten through. The features, forcibly distorted, wore a very evident expression of acute suffering. A more minute examination revealed the position of two more wounds. One,

apparently inflicted by a mace or hatchet, had cloven the left cheek and broken the lower jaw, the side teeth being laid bare. The other, hidden by the hair, had laid open the top of the head a little above the wound on the left brow. A downward hatchet-stroke had here split off an enormous splinter of skull, leaving a long cleft, through which some portion of the brain must have escaped. The king had evidently received these wounds, and died from them, in battle—a fact which was not known before, although his leadership in the war against the "Hyksos" was matter of record. Some irregularities which had been observed in the embalmment and the disordered condition of parts of the mummy are explained by this fact, and in the light of the probability that decomposition had begun before the body came into the hands of the embalmers.

The mummy of Seti I, second king of the nineteenth dynasty, and father of Rameses II, its identity being attested by the official priestly entries on the lid of the mummy-case, was unbandaged on the same day. At about midway of the total thickness of the wrappings occurred two lines of hieratic inscription in black ink, stating that "in the year nine, the second month of Pert (the season of seed-time), the sixteenth day, was the day of reclotting of the King Menma-ra (Seti I), to whom be life and health and strength." Another inscription, written on one of the smaller bandages, gave the date of the latest restoration of the king's funereal trappings. The body, says M. Maspero, in his account of the unbandaging "presents much the same appearance as that of Rameses II. It is long, fleshless, of a yellow-black color, and has the arms crossed on the breast. The head was covered with a mask of fine linen, blackened with bitumen," on the removal of which with the scissors was brought to view "the most beautiful mummy-head ever seen within the walls of the museum. The sculptors of Thebes and Abydos did not flatter the Pharaoh when they gave him that delicate, sweet, and smiling profile which is the admiration of travelers. After the lapse of thirty-two centuries, the mummy retains the same expression which characterized the features of the living man. Most striking of all, when compared with the mummy of Rameses II, is the astonishing resemblance between the father and son. The nose, mouth, chin, in short, all the features, are the same; but in the father they are more refined, more intelligent, more spiritual, than when reproduced in the son. Seti I is, as it were, the idealized type of Rameses II. He must have died at an advanced age. The head is shaved, the eyebrows are white, the condition of the body points to considerably more than threescore years of life, thus confirming the opinion of the learned, who have attributed a long reign to this king. The body is healthy and vigorous, notwithstanding the knotty state of the fingers, which bear evident traces of gout."

The Mummy of an Anonymous Prince.—In the more particular examination of the royal mummies found at Dayr-el-Bahari there was discovered the body of a young man of between twenty-five and thirty years of age, to which no inscription of any kind was attached. Instead of being embalmed in the usual way, the body had merely been dried by some skillful process, without removing any of the internal organs, and had been covered with some fatty and caustic mixture; and the whole attitude of the corpse and the expression of its face went to indicate that the unknown person had died in extreme agony. M. Maspero thought at first that the case might have been one of the embalmment of a living man, but medical men were of the opinion that a case of poisoning was indicated. Miss Amelia B. Edwards has suggested the possibility of a connection between this case and the great Palace-conspiracy directed against the life of Rameses III, of which an incomplete record is given in what is called the Judiciary Papyrus of Turin. Among the forty high officials and the ladies implicated in that conspiracy, were one Taia, supposed to be the queen, and a young man, her son, described as Pentaura, who is also called by another name. This young man, supposed to be a prince of the royal blood, suffered death in expiation of his crime; and M. Le Page Renouf has pointed out that the expression in the Turin papyrus describing his death as well as that of thirteen others, signifies that he died self-slain.

An Ancient Egyptian Romance.—M. Maspero, while excavating the tomb of one Sennotmou near Thebes, discovered a piece of inscribed limestone containing a complete version of the story of which the Berlin papyrus contains a part, and a fragment in the British Museum the last lines, which has been translated by him as "Les Aventures de Sinouit," and by the late C. W. Goodwin into English as the "Story of Saneha." The tale is supposed to be older by many centuries than the time of Moses. Of the story in the Berlin papyrus, the beginning is wanting; and this is supplied in the present copy. In the former copy, the hero, Saneha, appears flying from the wrath of his sovereign, and taking refuge with the Sati, or Asiatic tribes northeast of the Gulf of Suez, but nothing is given to show the nature of the offense he had committed. The newly discovered copy informs us that he had accidentally overheard a secret of state. According to M. Maspero, the purpose for which the stone containing the story was buried in the tomb, was to give the double of the deceased a source of entertainment in perusing this, one of the favorite stories of classic Egyptian literature. By breaking the stone, it was slain, and its double passed into the other world, to keep company with the double of the deceased. The breaking was not done without causing some damage to the text. A few of the words are chipped off, but the lacunæ could be filled

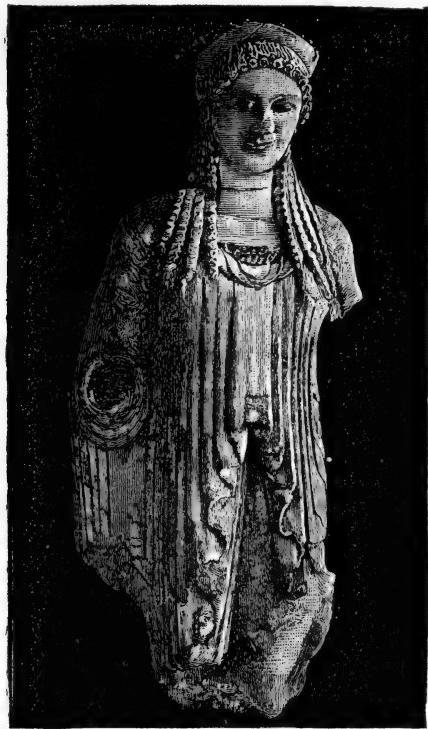

without difficulty. An historical point of some importance is established in the opening lines, in which the date of the death of Amenemhat I, in whose dynasty (the twelfth) the adventure is supposed to have happened, is given as "in the year thirty, the seventh day, the second month of Sha-t." Besides this story, and the bodies—which were those of an officer of the reign of Rameses IV and his family—the tomb contained a complete set of funeral furniture; the measuring implements of the deceased, two funeral-sledges, chests filled with food, and pottery of various kinds.

Miscellaneous Explorations in Egypt.—Gen. Grenfell, who is in command of the British frontier force at Assonan, has discovered on the western bank of the Nile a series of fine rock-cut tombs ranged, like the grottoes of Beni-Hassan, along an artificial terrace, more than half-way up the face of the cliff. The oldest tomb dates from the sixth dynasty, and others are of the twelfth dynasty. All are richly painted in the manner of the early tombs of Lower Egypt. The largest, which is of the sixth dynasty, measures 140 feet by 40 feet, and contains eighteen round and fourteen square columns. Another tomb, which is of the twelfth dynasty, and consisted of two halls supported on square columns and connected by a long corridor, contained some remarkable funerary statues, or Osiride figures, in baked clay, and sixty stelæ. These tombs are supposed to form a part of the hitherto undiscovered necropolis of the ancient frontier city of Abu or Elephantine. The tomb of the sixth dynasty was approached from the river-side by a flight of rock-cut steps, of which the remains still exist.

Greece. Archaeological Division of the Kingdom.—The kingdom of Greece has been divided by royal decree into eleven archaeological districts, for each of which an inspector of antiquities has been appointed, with authority. The remains discovered which have a local interest are to be placed in the collections of the district, while those having artistic value, or which may be important for the history of art, will be transferred to the Central Museum at Athens.

Discovery of Archaic Statues at Athens.—The excavators of the Greek Archaeological Society, working under the direction of Prof. Kavvadias, while digging to the southeast of the Erechtheum, came, at the depth of from seven to ten feet below the surface of the soil, upon six statues of Parian marble and a number of fragments. The statues had heads, but were without feet, and represent female figures of somewhat over life-size, clad in rich garments, with a broad diadem, or *stephane*, surrounding the hair. They differ from one another, but still may all represent the same goddess. The dresses are represented as done in very careful folds or plaits, which may be considered conventional, and indicating an archaic period of art, but which Dr. Charles Waldstein suggests may portray an actual style of dress-

ing of the age when they were made. They are attributed to the period before Phidias, and are regarded by Dr. Waldstein as marking the transition from the period of working in wood to that of working in marble. In support of his supposition, Dr. Waldstein cites peculiarities in the modeling and construction of the statues, which appear to have been borrowed from the methods of working in wood. Several of the statues had eyes of glass. The fringe of the tunic and cloak is adorned with parallel painted lines, and among these are painted small crosses and other ornaments resembling those of antique vases. The

ARCHAIC STATUE FOUND IN ATHENS.

colors have mostly preserved their primitive luster. Dr. Waldstein fixes the date of the statues at between 510 and 470 B. C. Among the other fragments of sculpture and architecture discovered in these excavations are inscribed stones, one of which bears the name of Evenor, and another, a pedestal, that of Antenor. The latter monument excites interest, because Antenor was the name of the artist who executed the statues decreed by the Athenians to the tyrannicides Harmodius and Aristogiton, which were taken to Persia by Xerxes, but were afterward restored to the Athenians by Alexander or Antiochus.

VOL. XXVI.—3 A

Antiquity of the Palace of Tiryns.—Mr. W. J. Stillman and Mr. F. C. Penrose have called in question the extreme antiquity assigned by Dr. Schliemann to the ruins he has excavated at Tiryns. They cite in justification of their doubts the occurrence of small stones, of marks of the saw and chisel and the tubular metallic drill, and of burned bricks in parts of the walls of the so-called Palace of Tiryns, as giving to the work there a fundamental difference in character from that of the undoubted Pelasgic architecture. Their views were fully presented in papers by them, which were read at the meeting of the Hellenic Society on the 2d of July, and were replied to in detail by Dr. Schliemann and Dr. Dörpfeldt. Dr. Schliemann maintained that his critics had failed to find some of the more convincing evidences of antiquity in the plans of the structure, for earth and sand had been heaped up in the palace by order of the Greek Archæological Society, to preserve the painted floors and thresholds from injury. They had also committed the error of mistaking the prehistoric walls of the palace for the late Byzantine walls of lime and bricks, whereas, in reality, they consist of quarry-stones loaded with clay mortar. "But in the great conflagration which destroyed the palace the stones were calcined, wherever beams of timber fed the flames, and thus the traveler thinks now he sees lime everywhere, and particularly so in the glare of the Oriental sun." Assuming that an ancient ruin may be older, but that it can not possibly be later, than the latest objects of human industry which we find within it, "let us see," Dr. Schliemann continued, "what we find in the prehistoric palace of Tiryns. We find the walls, both on the outside and on the inside, wainscoted first with a layer of clay and then with a still thicker layer of lime, which is smoothed and polished, and covered with paintings of the most archaic patterns that have ever been found. We find among them the pattern of the marvelous thalemos-ceiling of Orchomenos. Similar wainscoted and painted walls I found at Mycenæ. They were also found in ancient Phœnician buildings in Syria, and you may see them to the present day in the prehistoric city which has been discovered beneath three layers of pumice-stone and volcanic ashes on the island of Thera, which is more than 2,000 years older than the beginning of the Byzantine Empire, in 395 B. C. With regard to other objects of human industry, whoever takes the trouble to examine the illustrations in our book on Tiryns will see that, generally speaking, they are of the same shape, fabric, and manufacture as those of Mycenæ, which all archæologists unanimously attribute to 1200-1400 B. C., with the exception of the terra-cotta idols, most of which have much more ancient types, with the exception also of the arrow-heads and knives of obsidian, which for rudeness can only be compared to those I found in the prehistoric tumulus at Marathon, errone-

ously called the tomb of the 392 Athenians who fell in the battle of Marathon (490 b. c.), or to those found in the cave-dwellings in the Dordogne in France, which were inhabited at the time of the mammoth." Dr. Schliemann also insisted that the walls of quarry-stones bonded with clay were similar to walls which were "found by many hundreds in all the five prehistoric cities of Troy, in the treasures of Mycene, in the thalamos of Orchomenos, in Samos, in Cephalonia, in Eleusis, in the Acropolis of Athens, beneath the edifices destroyed by the Persians, and last, not least, in the prehistoric city in Thera." A paper by Dr. Dörpfeld, which was read, pointed out that all the indications referred to and insisted on by the critics as proving that the remains at Tiryns and Mycenæ were of a later date than that assigned to them by Dr. Schliemann and himself, such as the tools, and particularly the drill which appeared to have been used, and the mortar and other materials for the building of the walls, were equally apparent in the remains at Troy and in Egypt, which were admittedly of as high an antiquity as he claimed for Tiryns and Mycenæ.

The Temple of Amphiaraus at Oropus.—The Archæological Society of Athens has excavated the site of the Temple of Amphiaraus, one of the seven heroes who marched against Thebes, and was afterward worshiped as a god, at the ancient Oropus. The spot was brought into notice in 1856, by the finding of some squared stones with inscriptions mentioning special games, Ἀμφιαράū, which were held in honor of the god. Systematic excavations were begun in 1884. Of the walls of the temple, only the foundations remain. A fragment of a colossal piece of sculpture of white marble appears to be a piece of the statue of Amphiaraus mentioned by Pausanias. Near the remains of the great altar were what seemed to have been structures for the accommodation of spectators of the sacrifices. In a hall, the ruins of which were laid bare, were traced lines of marble seats, and a row of three-cornered marble pedestals for the reception of memorials was observed. A sculptured relief representing a ram is supposed to bear reference to the practice, described by Pausanias, of sacrificing a ram to Amphiaraus before seeking in dreams the answer of the oracle. One of the inscriptions, much injured, contained an inventory of the plate of the temple. Another contained a rescript of the consuls, M. Terentius Varro Lucullus and C. Cassius Longinus (73 b. c.), communicating to the Oropians the *senatus consultum* regarding the dispute between their city and the representatives of the Roman state. Another inscription contains the rules of the Amphiarium. In it are set down the hours at which the priests were bound to be within the precincts of the temple, the punishments for the misdeeds of the Demotæ and of strangers in the temple precincts, the penances of those who consulted the oracle, and the de-

tails of the ritual of the sacrifices, and of the sleeping in the temple.

The Great Aqueduct of Samos.—Mr. J. Theodore Bent has examined the aqueduct of Samos, which is described by Herodotus, and ascribed by him to Eupalinos the Megarian as its architect, the southern entrance to which was accidentally discovered in 1883. After descending nine steps on to the ground which rises directly behind the old town of Samos, the explorer passes through a narrow-built passage, covered at the top by an arch formed by two stones two feet in length, resting one upon the other, for 41 feet 3 inches into a wider passage chiseled in the rock, with a side-chamber 10 feet in height. This is connected by a door and window with a shorter passage, which appears to be of later construction. A round room is next entered, having recesses, as if for tombs, and then the aqueduct itself. Along the side of the channel for the water runs a ledge for walking, at an average height of six feet from the roof. The channel itself, from the roof to the base, is 33 feet 10 inches deep and 2 feet 7 inches wide, while the whole, including the channel and the passage, is 6 feet 11 inches, all cut in the hard rock. The point where the two sets of workmen met is marked by an error of 12 feet in the adjustment of the galleries, which has been rectified by making the roof at that spot very lofty; and then the channel takes a bend almost at right angles, and proceeds toward the northern opening. The northern entrance is similar to the southern, and consists of a series of passages reaching to the principal channel. From the source to the mountain, a distance of about half a mile, the water was conducted in pipes, many of which are still to be seen, one foot eleven inches long, overlapping, and each containing a hole for the escape of water if the pressure should be too great. The aqueduct is pronounced "a remarkable testimony to the enterprise of the ancients and their engineering skill."

Athenian Mosaics.—The remains of a bath in the Palace of Hadrian at Athens display handsome semicircular pavements in mosaics of beautiful geometrical designs, and colored in black, blue, red, yellow, and white. Patterns of circles intersecting so as to form squares with curved sides, and of non-intersecting circles inclosing designs of stars, leaves, etc., frequently recur. Each of the pavements is bounded on the exterior and interior sides by handsome leaf borders.

Archaic Inscriptions in Lemnos.—Two inscriptions observed by MM. Cousin and Durrbach, of the French school at Athens, on a rectangular stone at Kamisina in the island of Lemnos, are in characters of an archaic Greek alphabet, but in an otherwise unknown tongue, which has a general resemblance to Etruscan. They are referred by Dr. C. Pauli, of Leipsic, to the latter part of the seventh century b. c.

The Necropolis of the Esquiline Hill.—A large necropolis was recently discovered on the Es-

quiline Hill, containing so great a proportion (two thirds) of supellex of Etruscan manufacture, that some persons attributed it to that people, and it has been regarded by Mr. J. H. Middleton ("Ancient Rome in 1885," Edinburgh) as implying the existence of an Etruscan city of great size and importance, previous to the legendary period, and as "strong evidence against the theory of an early Latin superiority in Rome," Signor Rodolfo Lanciani, the official superintendent of the excavations in that quarter, who participated in the discovery of the necropolis, sees in it only proof of the great extent of the trade that was carried on between the Latin colonists of Rome and their Etruscan neighbors. The supellex of the cemeteries of Alba Longa, one third of which are of Etruscan manufacture, show that its people had commercial transactions with the Etruscans for a long period. The intercourse between the settlers on the Palatine Hill and these people, from whom they were separated only by the river Rumion and its marshes, must have been tenfold greater.

Excavations for building a sewer in the region of the plain of Testaccio have brought to light one of the terminal stones of the sacred area of Rome in its proper place. The stone bears a record of the amplification of the area which was made in A. D. 49.

The Horrea Galbae.—One of the buildings of the public docks, or warehouses, on the banks of the Tiber, which were known as the Horrea Publica, or Horrea Caesaris, has been laid open. It consists of a series of rectangular courts, wide enough to admit carts, with staircases at intervals giving access to the offices above. An inscription giving the names of the officers and keepers of the Horrea Galbae was found in one of the rooms. These boards appear to have been composed of sixty members, men and women, the former being always in the majority. A marble slab of the date of the Emperor Hadrian, found in the same neighborhood, records the terms on which the warehouses were let. Also connected with these discoveries is that of the tomb of the founder of the *horrea*, Sergius Sulpicius Galba, son of Sergius, consul in the year 646 of Rome, and great-grandfather of the Emperor Galba. It is built in the severe style of the republic, and bears an inscription simply recording the name and position of the man, with a group of consular fasces, of five each, on either side.

Barracks of the Equites Singulares.—A part of the barracks of the *Equites Singulares*, or horse-guards of the Roman emperors, has been discovered in the Via Tasso. It runs parallel with an antique street thirteen feet wide, and contains a hall more than ninety feet long, with smaller apartments on each side, the whole of which is built in the reticulated work of Hadrian's time. In it were forty-three marble pedestals or slabs bearing inscriptions of acknowledgment of veterans of the corps for being *missi honesta missione*, or having obtained

honorable dismissal after twenty-five years of faithful service. The inscriptions are either raised by individuals or by groups of from six to forty men. Those raised by individuals are usually dedicated to one god; those raised by the subscriptions of groups often to several gods and goddesses. The building is supposed to be a part of the older barracks.

The Ancient Vetulonia.—The site of the ancient Vetulonia has been fixed by Dr. I. Falchi at Colonna, in the province of Grosseto. One of the tombs contained more than twenty bronze vases, together with shields, helmets, swords, lances, and vases of silver, one of which was chiseled. The collections in the aggregate represent an extraordinary quantity of remains of Etruscan art.

Herr Pfarrer Schreiner has laid bare the military works of the Roman station of Abusina, on the Danube, which was established to maintain the connection between the armies of the East and the West. The remains indicate that the fortress was one of great importance and strength, and afford numerous richly adorned objects.

England. Discovery of a Prehistoric Boat at Brigg.—Workmen excavating for the gas-works at Brigg, in North Lincolnshire, England, on the 20th of April, found, a few yards from the river Ancholme, and some two or three feet below the surface, a large boat, or canoe, cut out of the trunk of a solid tree. It was 48 feet long, 4 feet 4 inches wide, and 2 feet 9 inches deep, and had been shaped in a very workman-like manner with the adze or axe. The prow was rather blunt, and the stern—the log having been cut through to the end—had been fitted in with a plank end, beyond which the sides projected as if it had been designed that they should support a raised deck or seat. Large holes pierced through the wood toward the top edges of these projections appeared to have been intended for the insertion of cords to bind the sides and press them up close to the plank ends. Other smaller holes along the sides of the vessel may have been for cords for lashing the sides and preventing their springing. In hollowing the boat, ridges of timber had been left at intervals, crossing the bottom athwartship, which seemed to correspond with the floor-timbers of modern craft. No definite age has been assigned to this boat, but it is regarded as very ancient.

Afghanistan. The Colossal Statues of Bamian.—At Bamian, where the road between Cabul and Balkh crosses the Paropamisus range, at a height of about 8,500 feet above the sea, are five colossal statues, three of which are in niches cut out of the conglomerate rock of the cliff, the figures themselves being formed of the rock within the niche. The largest statue, which is one of these three, is 173 feet high, and is called by the Mussulmans the "male idol," and said by the Chinese to be an image of Buddha. At its feet are entrances, which communicate with stairs and galleries, so that

the top of the figure can be reached. The second statue—which is called the “female idol”—can also be ascended, and was ascended by Capt. Maitland, of the Anglo-Indian army, who, coming out by an opening over the head, measured it with a tape-line, and found its height to be 120 feet. The third statue has been estimated to be about 50 or 60 feet high, but it has almost entirely disappeared. The fourth statue is that of a sitting figure, as is represented in the accompanying illustration. The fifth statue is about a mile from the others. The cliff in which the niches and statues are executed is pitted with caves, some of which are shown in the engraving around the statue, which are said to have been excavated by

the statues were on “the northeast of the royal city”—probably Ghulghula, which was utterly destroyed by Genghis Khan in the thirteenth century—and speaks of one of them as a figure of Buddha. The presumption of their Buddhist origin is supported by all the characteristics of their style.

ARGENTINE REPUBLIC, an independent republic of south America. (For details of area, population, etc., see “Annual Cyclopædia” for 1883.)

Government.—The President is Dr. Juarez Celman, whose term of office will expire on Oct. 12, 1892. The Vice-President is Señor Carlos Pellegrini. The Cabinet was composed of the following ministers: Interior, Dr. Posse; Foreign Affairs, Dr. Wilde; Finance, Dr. Pacheco; War and Navy, General Racedo. The Argentine Minister at Washington is Dr. L. L. Dominguez, and the Consul-General at New York, for the Union, is Señor C. Carranza. The United States Minister at the Argentine capital is Hon. B. W. Hanna, and the American Consul at Buenos Ayres, E. L. Baker.

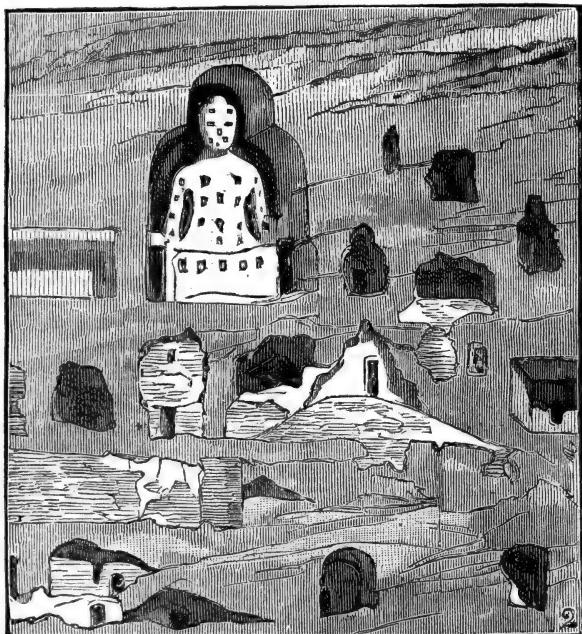

Army.—According to official returns bearing date of April, 1886, the army of the republic, exclusive of the National Guard, was 7,599 strong, comprising 3,638 infantry, 2,788 cavalry, and 1,448 artillery. The National Guard was 409,406 strong, 356,400 of whom were enrolled for active service, and 52,646 constituted the reserve force. The artillery was equipped with 250 guns, the majority being Krupp guns between 24 and 75 centimetres caliber, and the others, guns of 7 to 15 inches caliber, made on the Rodman, Armstrong, and Parrot systems.

Navy.—The navy consisted, in April, 1886, of three ironclads, six gunboats, seven torpedo-boats, six steam transports, and twelve sailing-vessels, carrying 1,366 men.

Finances.—At the close of the fiscal year 1885-'86 the public debt consisted of the following items:

Foreign debt.....	\$75,519,000
Home debt.....	46,664,000
Floating debt.....	26,601,000
Total.....	\$148,778,000

Argentine indebtedness and financial resources have been closely canvassed in Europe during the year, since, especially in Germany, there is a sort of mania for investing in loans of that country, chiefly because of the remarkable current of emigration of agriculturalists.

FOURTH (SITTING) STATUE OF BAMIAN.

Buddhist monks during, probably, the first five centuries of the Christian era. Many of these caves are inhabited; and some of them are shown to have been bricked up in front. The niches and caves are adorned with paintings and ornamental devices which show considerable artistic skill. The statues bear evidence of mutilations, which are said to have been caused by the soldiers of Timour, who shot arrows, and by the troops of Nadir Shah, who fired artillery at them. Their origin is not certainly known. As they are not mentioned in any of the accounts of Alexander's expeditions, it is supposed that they were not in existence in his time. Hwen Tsang, the Chinese pilgrim, who visited Bamian about A. D. 630, says that

The floating debt comprised the following items:

Due the National Bank.....	\$10,652,000
Due the Provincial Bank.....	4,647,000
Due European banks.....	4,775,000
Treasury notes outstanding.....	6,585,000
Sundry indebtedness.....	4,119,000
Total.....	\$30,028,000
Less coupons.....	3,427,000
Total.....	\$26,601,000

According to the budget estimate for 1886-'87, the income will exceed the outlay by \$1,088,410. The expenditure is estimated to exceed the last budget by \$2,590,000. There is an increase of outlay of \$3,533,000 in the Departments of the Interior, Public Instruction, Navy, and Foreign Affairs, and a decrease of \$943,000 in those of Finance and War. The increase in the Department of the Interior, \$1,825,000, comprises \$1,048,000 for railroads.

During the fiscal year ended in April, 1886, the province of Buenos Ayres had canceled \$11,599,442 of its bonded debt of \$53,491,098, leaving an indebtedness of \$41,891,656.

In consequence of the political excitement engendered by the congressional and presidential elections, the gold premium fluctuated continually, and at times wildly. After the excitement had abated, the influx of gold under the national and provincial loans effected in Europe hastened the downward course of the gold premium.

Early in January the Government made a 5 per cent. loan of £4,000,000 in London, at 80 per cent. During the summer the Provincial Bank, in behalf of the province of Buenos Ayres, negotiated a 5 per cent. loan of £2,500,000, to be issued Oct. 1, in Hamburg and Frankfort, the amount eventually to be extended to 50,000,000 marks.

The Government has been authorized by Congress to create a national bank, with power to issue notes to the extent of \$40,000,000 in the shape of *cédulas hipotecarias* for the purpose of loaning money on landed property, not to exceed 50 per cent. of its taxed value. The rate of interest to be 6 to 8 per cent. per annum, 1 or 2 per cent. to go toward the sinking fund to be provided for gradually extinguishing the issue; no single loan to any individual to exceed \$200,000. In addition to the interest, the bank is to be entitled to 1 per cent. commission; the nation to guarantee the issue and canceling of the debt, and a credit of \$1,000,000 to be opened at once, to enable the bank to go into operation.

Post-Office.—In 1885 the Argentine Post-Office handled 20,050,000 letters, and 15,425,000 newspapers and packages. The amount of postage collected was \$709,250, being an increase of 15 per cent. as compared with 1885, and 75 per cent. greater than in 1881. The number of post-offices is 637.

Railroads.—In October, 1880, there were in operation in the republic 2,318 kilometres of railway: national, 1,810; provincial, 348; pri-

vate, 1,104. In 1886 there were in operation 6,152 kilometres, of which 1,877 were national, 1,104 provincial, and 3,160 private property. There were consequently built in five years 3,884 kilometres. The total gross earnings of all the railroads in operation in 1885 were \$16,150,894; of net earnings, \$6,489,701. The percentage of net earnings has been 7.32, against 2 per cent. average in Canada; 3½ per cent. in Australia and Belgium; 4½ per cent. in Germany and France, 4½ per cent. in England and British India, and 5 per cent. in the United States.

There were built in 1885 the following portions of lines:

	Kilometres.
On the Andine.....	95
On the Northern Central.....	100
On the Santiago del Estero.....	166
On the Campana.....	153
On the Buenos Ayres and Pacific.....	386
On the Argentine Central.....	30
Total.....	885

Canalization.—On Aug. 3 the Governor of the province of Buenos Ayres submitted to the Provincial Legislature the project of reclaiming certain swamp-lands by means of drainage. They are near the Salado, Vecino, and Samborombon water-courses, and subject to extensive inundations. The lands alluded to cover an area of 2,480 square leagues, constituting about half of the entire province. There would have to be expropriated two square leagues, estimated to be worth \$18,000,000, and the digging of the canals will involve an expenditure of \$40,000,000. In order to raise this amount, the Governor proposes to negotiate a 6 per cent. loan in Europe to the amount of \$54,000,000, which will probably net \$48,000,-000. The expropriated land he expects to be able to sell for three times its cost, i. e., for \$54,000,000, and, adding thereto the \$48,000,-000 of estimated proceeds of loan, the sum realized would be \$102,000,000. Deducting therefrom the \$18,000,000 to be paid for land, and \$40,000,000 cost of canalization, there would be a profit of \$44,000,000, sufficient to cancel the foreign loan if negotiated at 80 per cent.

Telegraphs.—The lines in operation in 1885 aggregated 18,767 miles, and employed 1,283 persons. The telephone service now extends 70 kilometres beyond Buenos Ayres, facilitating communication with the new port of call, Ensenada.

Viticulture.—The vine has begun to be extensively cultivated in the provinces of Mendoza, San Juan, Catamarca, and La Riorja, and the wine made now competes with similar growths from Spain and Italy. The import of wine into the republic had meanwhile increased, notwithstanding increased domestic production, from \$6,680,824 in 1883 to \$8,259,816 in 1884; that of spirits from \$2,051,123 to \$2,353,825, and of beer from \$584,866 to \$825,717.

Commerce.—The foreign trade of the Argentine Republic for five years has been:

ARGENTINE REPUBLIC.

YEARS.	Imports.	Exports.
1881.....	\$54,030,000	\$56,069,000
1882.....	61,000,000	60,389,000
1883.....	80,485,000	60,207,000
1884.....	94,056,141	69,029,886
1885.....	95,895,102	91,191,145

The Argentine foreign trade was distributed in 1884 as follows (in thousands of dollars) :

COUNTRIES.	Import.	Export.	COUNTRIES.	Import.	Export.
England.....	30,727	7,211	Brazil.....	2,332	1,462
France.....	16,785	22,518	Uruguay.....	5,638	2,111
Belgium.....	7,249	14,880	Chili.....	12	2,082
Germany.....	8,863	6,814	Paraguay.....	1,414	94
Italy.....	3,996	1,804	West Indies...	1	759
Spain.....	4,701	1,517	Other countries.	8,729	2,680
Holland.....	1,105	2	Total.....	94,056	68,029
United States.	7,454	4,065			

The goods shipped were :

Wool, tons.....	114,345	Cattle, head.....	147,095
Hides, number.....	2,849,709	Minerals, value.....	\$1,024,000
Sheep-skins.....	24,939	Bones, tons.....	38,255
Horse-hides, number.....	281,451	Linseed, tons.....	38,992
Other skins, value \$1,397,000		Wheat, tons.....	108,499
Tallow, tons.....	14,338	Indian corn, tons.....	118,710
Horse-hair, tons.....	1,738	Ostrich-feathers, number.....	81
Jerked beef, tons.....	18,870		

Wool showed in 1885 an increase of exportation of 14,000,000 kilogrammes, and in value \$8,945,000; jerked beef increased \$2,300,000 worth, and linseed \$1,600,000. During the wool-clip of 1885-'86 the export from Buenos Ayres, from Oct. 1, 1885, to July 31, 1886, was 259,328 bales, against 286,512 bales the previous season. During the first seven months of 1886 there were imported into Buenos Ayres \$55,197,899 worth of merchandise, compared with \$42,098,126, during the corresponding period of the preceding year; the export through the same port was \$41,208,987 and \$40,829,050, respectively. The River Plate slaughterings of cattle were :

LOCATION.	1886.	1885.	1884.	1883.
Buenos Ayres.....	181,661	246,600	88,700	154,800
On the banks of rivers.	744,106	754,600	736,100	648,500
Montevideo.....	314,162	256,500	341,500	262,500
Rio Grande.....	341,000	385,000	345,000	312,000
Total.....	1,580,929	1,642,700	1,511,300	1,377,300

The American trade with the Argentine Republic is shown in the following table :

FISCAL YEAR.	Imports from the Argentine Republic into the United States.	Domestic exports from the United States to the Argentine Republic.
1886.....	\$5,022,346	\$4,331,770
1885.....	4,328,510	4,327,026
1884.....	4,110,938	4,925,818
1883.....	6,192,111	8,857,670

Change of Duties.—Dating from Jan. 1 the new export duties were 4 $\frac{1}{10}$ per cent. on wool and sheep-skins, and 3 $\frac{1}{10}$ per cent. on hides, tallow, horns, and bones, there being added 15 per cent. to each of these rates. Changes in import duties also becoming operative on Jan. 1, were as follows: Yerba maté, or Paraguay tea, had the specific duty of 7 cents per kilo-

gramme changed to an ad valorem duty of 45 per cent. The duty on stearine and paraffine candles was raised from 10 to 15 cents per kilogramme, and on stearine from 8 to 12 cents.

Education.—In 1869, out of 413,465 children old enough to attend school, only 82,671 were being taught in public or private schools, the percentage receiving instruction being 19. In 1885, 168,378 out of a total of 503,691 attended school, or about 34 per cent.; there were in the latter years 1,741 educational establishments, the number of teachers therein being 3,698. In 1883 the number of schools was 1,473; of teachers, 2,602; of pupils, 107,961. The progress in the last two years was, therefore, more striking still than what had been accomplished since 1869. In 1886 many primary schools were in course of construction.

Immigration.—In 1885, 108,722 immigrants landed at Buenos Ayres, and 21,500 cabin-passengers, constituting a total of 130,222 newcomers—an increase of 30,918 over the previous year. Of the immigrants, only 30 per cent. were agriculturists.

Colonization.—There are in a flourishing condition in the province of Santa Fé alone 98 settlements, occupying an area of 748,585 square cuadras, 251,600 of which are under cultivation. Of these, 158,800 are under wheat-culture; 45,300 produce flax, and 47,500 Indian corn and other cereals.

The Government did not feel induced to push in 1885 its system of official colonization, although experience had demonstrated its advantages. It considers sufficient for the time being the 18 Government settlements extant, 11 of these being on Government lands; 5 in the province of Córdoba, and 2 in Entre-Ríos.

On the other hand, a beginning has been made with Government land-sales, and the result has been satisfactory. Thus there were sold 516 leagues of pastures in the Territory of Neuquén, half cash and the balance payable in annual installments. The amount realized was \$1,106,222, \$173,789 being paid in cash. The average price obtained per league was \$2,019, and the expense of surveying the lands at the charge of buyers. In the Chaco district there were sold small farms for agricultural purposes to the extent of \$15,118, \$3,024 being paid in cash. There were sold altogether \$66,489 worth of farming-lands. The land-sales during the second quarter of 1886 were as follow:

PROVINCES.	Square leguas.	Amount of money collected.	Price per square legua.
Buenos Ayres.....	117	\$3,919,000	\$24,400
Frontier districts.....	86	347,000	4,040
Córdoba.....	22	166,000	7,550
Entre-Ríos.....	2	50,000	25,000
Mendoza.....	11	23,000	2,100
Santa Fé.....	91	697,000	7,700
Other provinces.....	151	50,000	330
Total.....	450	\$4,652,000	\$9,700

The Government is the owner of 126,125 square miles of public lands; but these com-

prise the 60,000 square miles situated within the territories recently begun to be settled. But, independently of the latter, the Government owns in the provinces 36,400 square miles of paturage-lands; 29,100 of forest and mountain-lands, and 625 agricultural lands. The pastures are worth \$388,000,000, the forests and mountain-lands \$49,000,000, and the portion suitable for farming purposes \$90,000,000, constituting in the aggregate a national domain of \$527,000,000.

Real estate of every kind has risen in value, as follows:

LOCALITIES.	1860.	1884.	Increase in value.
	Value.	Value.	Per cent.
Throughout the republic.	\$107,000,000	\$487,000,000	385
In the province of Buenos Ayres,.....	44,000,000	301,000,000	584
In the remaining provinces.....	63,000,000	186,000,000	195

During the interval the population increased 154 per cent., and the product of stock-farms and agriculture 252 per cent.

Exhibitions.—Besides the International Exhibition of Agricultural Products and Machinery, opened at Buenos Ayres on April 25, the Italian colony there held a second exhibition of its own, the Government granting every facility for the purpose. The industrial center of that city, moreover, contemplates holding a national exhibition preparatory to the exhibit that the republic will make at Paris in 1889.

Exploring Expeditions.—M. Thouar, the French explorer, returned from his Pilcomayo expedition, which established the fact that the Pilcomayo river is navigable through its entire course. There is to be formed a river steam navigation company between Buenos Ayres and Bolivia, for navigating the Pilcomayo, and a committee has been appointed.

The Argentine Geographical Institute was preparing to fit out a scientific exploring expedition to Patagonia. It was to leave Santa Cruz under the command of Lieut.-Col. Noyano, thence to proceed southward along the Andes till it reached the Straits of Magellan. It was hoped that the Government would co-operate, in order to establish whether the Rio Negro and Santa Cruz rivers are navigable, and that it would order the frontier troops at Limay to assist the expedition.

In September the members of a French scientific exploring expedition arrived at Buenos Ayres, with the intention of exploring the Central Chaco for geographical, ethnological, and zoological purposes. M. de Brettes, member of the Paris Geographical Society, is the commander of the expedition. He will be accompanied by Engineer Boiviers, M. Robin, an officer of artillery, and M. Judas, who has recently arrived from Tonquin. The exploring party was to set out from Tarija.

Gold Discoveries in Patagonia.—The discovery of placer-gold near Cape Virgins and the

Straits of Magellan induced the Government to place one of its cruisers, the "Villarino," on the line, touching at Patagones, Chubut, Deseado, Santa Cruz, and Gallego. The gold is found in the sands of a tract of land between the Straits of Magellan and the Gallegos river, under the fifty-first parallel of southern latitude. It exists both in the sands of the beach and of rivers, but varies a great deal in richness. On the Chilian side, at Punta Arenas, a free port, many adventurers were engaged in washing the auriferous sands. Both in the Argentine Republic and in Chili the existence of gold near the frontier of their southernmost possessions created excitement, and the Argentine Government took the necessary steps toward establishing a maritime authority on the spot, by sending down there a committee of officers and an engineer. Meanwhile, applications for concessions to work the mines were pouring in.

Arizona. Territorial Government.—The following were the Territorial officers at the beginning of the year: Governor, C. Meyer Zulick; Secretary, James A. Bayard; Treasurer, Thomas J. Butler; Auditor, E. P. Clark; Superintendent of Public Instruction, R. L. Long. Judiciary, Supreme Court: Chief-Judge, John C. Shields; Associate Justices, William W. Porter and William H. Barnes.

Mining.—The product of Arizona in precious metals for 1885 is given by Wells, Fargo & Co. as \$5,748,710 silver and \$846,426 gold. To this should be added 20 per cent. for ores extracted by chlorides and shipped to San Francisco and Colorado for treatment. This shows a falling off from 1884. Mining industries have been depressed for several years, consequent upon the low price of silver and copper. During the present year much attention has been given to prospecting for gold, with gratifying results. The copper-mines of Arizona, except where they are close to the railroad, and ores are easily fluxed, can not be worked at a profit. The coal-fields in Apache and Yavapai counties will be worked profitably when railroads make a market.

Railroads.—In connection with the Southern Pacific and the Atlantic and Pacific, which traverse the Territory from east to west, the Arizona and Sonora, which runs from Benson to Nogales on the Sonora line, and the Clifton and Lordsburg narrow-gauge, which runs for about 40 miles in Arizona, there are now under construction a road from Prescott Junction on the Atlantic and Pacific to the city of Prescott, a distance of 72 miles; one from Calabasas *via* Tucson to Globe City, which will be about 150 miles long, and a road from Maricopa Station on the Southern Pacific *via* Tempe to Phoenix.

Desert Lands and Irrigation.—Arizona contains nearly 114,000 square miles. About 18,000,000 acres are utilized for stock-raising, and upon it graze nearly 1,000,000 head of cattle, more than 1,000,000 sheep, besides horses,

mules, and other domestic animals. Nutritious grasses grow everywhere, and, could the residue of the land adapted to grazing be utilized for that purpose, this might become the greatest stock-raising country in the United States. The want of water is the only drawback. For the most part these lands lie so that water reservoirs could be constructed.

Products of the Salt River Valley.—In the Salt River Valley during the past year there have been under cultivation 44,200 acres of land, supplied with water from the various canals, and divided as follows: Barley, 16,000 acres; wheat, 14,000; alfalfa, 10,000; miscellaneous products, 4,000; grapes, 700; fruit-trees, 500.

Gila River and other Valleys.—What has been accomplished in the Salt River Valley through irrigation has been followed with equally good results in the Gila River Valley, as the orchards, vineyards, grain and alfalfa fields of Florence and Gila Bend fully attest. The lands of the Colorado River Valley, near Yuma, where water has been brought upon them, are found to be well adapted to the growth of bananas and all citrus fruits. In these valleys the fruit ripens three weeks to a month earlier than in Southern California. Their adaptability to grape-culture and wine-making has been proved.

High Mesa - Lands.—The high mesa-lands of Graham, Mohave, Yavapai, and Apache Counties, wherever water has been introduced upon them, are found to be very productive. Here are grown peaches equal in flavor and excellence to the best Delaware product—raspberries, pears, blackberries, cherries, and apples not excelled anywhere. What has been done in these counties by irrigation appears from the following result of farming in Apache County this year:

ARTICLES.	Land.	Production.
	Acres.	Pounds.
Wheat.....	8,810	8,972,000
Barley.....	1,720	2,520,000
Oats.....	8,508	8,786,450
Corn.....	1,312	1,459,440
Total	9,848	11,787,920

Educational.—By reference to the annual report of the Bureau of Education for the years 1883-'84, it will be seen that Arizona expended in that year per capita on children enrolled in the public schools, \$35.84, and on average attendance in the public schools, \$48.33, which is more than that of any other State or Territory. The facilities in this direction have been much extended during the past year. There are now in successful operation a normal school at Tempe, in Maricopa County, and in course of construction a Territorial University at Tucson, Pima County. Any child can obtain a good common-school education.

Political.—A delegate to Congress, a Superintendent of Public Instruction, and members of the Legislature, were elected on the 2d of No-

vember. The Democratic candidate for delegate was Marcus A. Smith. The Republican candidates were: For delegate, C. C. Bean; Superintendent, Thomas Cordis. The Democrats were successful. The vote of the Territory for delegate has been as follows:

YEARS.	Republican.	Democrat.
1880.....	8,606	4,095
1882.....	5,141	6,121
1884.....	6,747	5,595

Indian Hostilities and General Progress.—Under this head, the Governor, in his report to the Secretary of the Interior, dated Sept. 25, says: "The constant raids of the renegade Apaches, under the lead of Geronimo and Natchez, for the past sixteen months, have done much to retard the development of the Territory. But the capture of these outlaws and the transportation of the Chiricahua and Warm Spring Indians to a distant country, have had a beneficial effect upon our industries. The border counties of Cochise, Pima, and Graham have suffered materially from this cause during the past year, and indirectly all sections of the Territory have been affected. In some counties the tax-roll shows for this year an addition of 50 per cent. It is certain that the assessment-roll of the Territory will show a very decided increase upon the assessed values of 1885. The San Carlos Indian Reservation contains 3,950 square miles, well watered and well timbered, most of which is as good as any agricultural land in this Territory or in this country. Upon this tract are gathered of Yuma, Tonto, and White Mountain Apaches about 3,500, so that each Indian, male and female, young and old, holds over 700 acres of land. These Indians are nearly self-supporting."

ARKANSAS. State Government.—The following were the State officers during the year: Governor, Simon P. Hughes, Democrat; Secretary of State, E. B. Moore; Treasurer, W. E. Woodruff, Jr.; Auditor, A. W. Files; Attorney-General, D. W. Jones; Commissioner of State Lands, Paul M. Cobbs; Superintendent of Public Instruction, Wood E. Thompson. Judiciary, Supreme Court: Chief-Judge, Sterling R. Cockrill; Associate Justices, W. W. Smith and B. B. Battle.

Financial and Material Progress.—The following statement shows the financial condition of the State:

Rate of taxation.....	4 mills.
Expenses State government, 1884 to 1886.....	\$380,000
State debt, 1886.....	5,103,000
General revenue fund in treasury, 1886.....	419,615
Tax on railroads, 1886 (4 mills on).....	13,721,000
State land-office—receipts above expenses, 1884 to 1886.....	110,027

According to a public declaration of the Governor, there are nearly 2,000 miles of railroads in operation in Arkansas, the population is at least 1,000,000, and the assessed valuation of property has increased from \$87,000,000 to \$130,000,000 since 1874. Taxes are now paid upon all lands and other property

owned by railroad corporations in the State, the assessed valuation of their tracks, superstructures, and rolling-stock having increased about \$7,500,000, since 1884, being now \$13,704,638. The State expended for the year ending June 30, 1885, for school purposes, \$729,168.31, leaving a balance of school fund on hand of \$469,837.51. The 5-mill district-school tax is voted annually by the people in nearly all the school districts.

Within the past year have been erected substantial buildings for the School for the Blind, and that for the deaf-mutes, and a large addition to the Lunatic Asylum, and two new buildings within the walls of the Penitentiary, and the old State-house has been repaired and improved.

Political.—The Democratic State Convention was held in Little Rock, on the 30th of June and the 1st of July. The following ticket was nominated: For Governor, Simon P. Hughes; Secretary of State, Elias B. Moore; Attorney-General, Daniel W. Jones; State Treasurer, William E. Woodruff; Associate Justice, Burrell B. Battle; Auditor of State, William R. Miller; State Land Commissioner, Paul M. Cobbs; Superintendent of Public Instruction, Wood E. Thompson. The platform adopted contained the following:

We indorse the National Democratic Administration, and reaffirm our allegiance to the national Democratic party and our firm adherence to its time-honored principles.

We regret the depressed condition of the agricultural interests of the State, and the strained relations of capital and labor, and trace these conditions directly to the operation of a high protective tariff.

We are in favor of the unlimited coinage of silver, and demand that the coin of the United States, gold and silver, be paid out on the debts of the Government, without discriminating against silver.

We recommend the payment of the State debt as rapidly as it can be accomplished under reasonable taxation, consistent with public interest.

We recognize that agriculture is the main stay and chief support of the State; we demand that the General Assembly shall foster and encourage it by establishing a Bureau of Agriculture and Labor Statistics, with a view to the improvement of the conditions of the laborer and the advancement of agriculture.

We recognize that railroads are among the prime factors of modern civilization, and we demand that the General Assembly shall foster and encourage their construction and maintenance by wise and just laws, and shall prohibit all willful obstruction to their operation. At the same time we declare that railroads are public highways, subject to the control of the State for the benefit of the public. We therefore demand that the General Assembly shall so regulate freight and passenger charges as to protect the interest of the people while doing justice to the railroads, making their charges equal and uniform, and shall prohibit, under severe penalties, all discriminations in favor of or against particular persons, localities, and classes of freight.

The Republican State Convention met in Little Rock, near the end of July, and nominated the following ticket: for Governor, Lafayette Gregg; Secretary of State, H. A. Millen; Attorney-General, D. D. Leach; Treasurer, L. Altheimer; Auditor, David B. Russell; Asso-

ciate Justice, Supreme Court, O. D. Scott; Land Commissioner, A. W. Stone; Superintendent of Public Instruction, A. H. Boles. The following are the essential features of the platform:

We demand that the system of protection to American industries, which has been built up and sustained by the Republican party, be maintained in all its integrity; that the great privileges which have been achieved by the sacrifice of the blood and treasure of the nation be forever maintained, and for this reason we favor an honest redemption of every pledge made by the nation to those who sacrificed their lives for the maintenance of the Union.

We are opposed to the policy which indiscriminately vetoes acts for the relief of those who imperiled their lives and sacrificed their health for the nation in time of its peril, and rewards insubordination in time of war by special places of honor and profit.

We demand that the public domain, which is the common property of the people, shall be reserved for actual settlers and neither donated nor sold to speculators or soulless corporations.

We denounce the Democratic party of this State for failing to redeem any of the pledges made to the people; for enacting and maintaining a system of criminal laws, which in cruelty surpasses that practiced in the middle ages, for permitting convict-labor to compete with honest workingmen; for the failure to punish corruption and embezzlement in high places, and especially for allowing the State treasury to be plundered of over \$100,000 of the hard-earned money of the people, and signally failing to punish the plunderers or to restore the money into the treasury, and rendering any attempt therat futile by approving bonds of officials, known to be nugatory and void by the approving official at the time of their approval; for enacting laws which nullify the beneficial provisions of the Constitution regarding homestead exemptions; for failing to enact laws for the protection of the laborer, and giving him a cheap and speedy remedy for the collection of his just dues; for encouraging the most flagrant violation of the sacred right of suffrage; and for the purpose of assisting these frauds they have provided for separate elections at great expense to the people and injury to the business interests.

We recognize the fundamental principle of our Government that all power is in the people, and we therefore favor a submission to the people of the State of an amendment to the Constitution prohibiting the manufacture or sale of alcoholic liquors in this State.

In all elections in this State where there are no regular Republican candidates in the field, we recommend to the Republicans that they support the Independent candidates, as against the regular nominees of the Democratic party.

Early in August a ticket was put in the field by a committee of the State Agricultural Wheel, appointed at a meeting held June 9. The following were the nominees: for Governor, Charles E. Cunningham; Secretary of State, J. J. Bell; Auditor, Oliver S. Jones; Treasurer, T. J. Andrews; Superintendent of Public Instruction, A. B. Marberry; State Land Commissioner, C. E. Tobey; Attorney-General, John M. Harrell. Mr. Harrell declined the nomination. At the election, on Sept. 6, the Democratic ticket was successful. Returns from 66 counties out of the 75 show the following vote for Governor: Democratic, 81,600; Republican, 46,100; Wheeler, 17,600. At the same time a vote was taken on the question of license and no license. In 70 counties the total vote was 165,000, and the vote for license 75,000;

while the vote against license was nearly 65,000. This shows an increase in the Prohibition vote of about 21,000 in the past two years—the vote of 1882 was less than 20,000, and that of 1884, 44,000. In the last election the Prohibitionists carried thirty counties, and many of the more ardent members are in favor of nominating a full State ticket and making a strong fight for the State officers. On Nov. 2 five Democratic Congressmen were elected.

Agricultural Wheel.—At the invitation of the President of the State Agricultural Wheel of Arkansas, a conference of the State Agricultural Wheels of Tennessee, Kentucky, and Arkansas was held at Litchfield, Ark., on the 28th and 29th of July. The result was the formation of "The National Agricultural Wheel of the United States of America," to consist of delegates from the various State Agricultural Wheels, and the framing of a constitution for that body. The organization is secret. The reasons for its formation and its objects are set forth in the following preamble and extracts from the Constitution:

Whereas, The general condition of our country imperatively demands unity of action on the part of the laboring classes, reformation in economy, and the dissemination of principles best calculated to encourage and foster agricultural and mechanical pursuits :

We hold to the principle that all monopolies are dangerous to the best interest of our country.

We hold to the principle that the laboring classes have an inherent right to sell and buy when and wherever their interests are best served, and patronize none who dare, by word or action, oppose a just, fair, and equitable exchange of the products of our labor.

We denounce as unjust and unfair any set of men who sell at large profits to gain the advantage over the laboring classes, and obtain the product of their labor at greatly reduced prices.

Therefore we have formed the National Agricultural Wheel of the United States of America, for the purpose of organizing and directing the powers of the industrial masses, but not as a political party. In this organization are sentiments and measures for the benefit of the whole people, yet it should be borne in mind when exercising the right of suffrage that many of the objects herein set forth can only be obtained through legislation.

The objects of the order shall be to unite fraternally all acceptable male persons over the age of eighteen years who are engaged in the occupation of farming. Also all mechanics who shall be actually engaged in the pursuit of their respective trades : *Provided*, That no proprietor of any manufacturing establishment employing more than three hands shall be eligible to membership ; and, provided further, there shall be separate organizations for the white and colored.

To give all possible moral and material aid in its power to its members, and those depending on its members, by holding instructive lectures, by encouraging each other in business, and by assisting each other to obtain employment.

The body adjourned to meet at McKenzie, Tenn., on the second Tuesday of November, 1887, subject to the ratification of the State Agricultural Wheels.

ART. See FINE ARTS IN 1886.

ARTHUR, Chester Alan, twenty-first President of the United States, born in Fairfield, Franklin County, Vt., Oct. 5, 1830; died in New

York city, Nov. 18, 1886. He was the eldest son, among nine children, of Rev. William Arthur, who emigrated from Ireland at the age of eighteen, published the "Antiquarian" for several years, and was the author of "Family Names" (New York, 1857). He was a Baptist, and occupied pulpits in New York and other cities. His wife was Malvina Stone, granddaughter of Uriah Stone, a New Hampshire pioneer. Chester was prepared for college at Union Village and at Schenectady, and entered the sophomore class of Union College in 1845. He taught school during the first and last years of his course, and after graduation, at eighteen years of age, he fitted boys for college, at his home in Lansingburg, and became principal of an academy at North Pownal, Vt. In 1854 President Garfield, then a student at Williams College, taught penmanship in this academy. While teaching for a livelihood, Mr. Arthur was pursuing a course of legal studies, and in 1853 he went to New York city and entered the office of Erastus D. Culver, was admitted to the bar, and became partner in the firm of Culver, Parker, and Arthur. Mr. Culver, who had been an anti-slavery member of Congress, was a personal friend of Dr. Arthur's, as was also Gerrit Smith ; and from their recitals of the dragging through the streets of Boston of William Lloyd Garrison, and the indignities offered to many other anti-slavery men and women, young Arthur imbibed a strong hatred to slavery and its effects. He had ample opportunities to prove the strength of his principles and welcomed them.

The first was in the famous Lemmon case, in which a slaveholder named Jonathan Lemmon, wishing to take eight slaves to Texas, took them first to New York from Norfolk, intending to ship them thence, when Louis Napoleon, a free colored man, petitioned for a writ of *habeas corpus*, which was issued by Judge Elijah Paine of the Superior Court of New York city. In the trial that followed, Mr. Culver and John Jay defended the slaves, and H. D. Lapough and Henry L. Clinton appeared for the master. The decision rendered by Judge Paine was, that the slaves were made free by being brought by their master into a free State, and in December, 1857, the Supreme Court affirmed Judge Paine's decision. Mr. Arthur was an earnest friend of the slaves, went to Albany to promote legislative action in their behalf, and was one of their counsel, William M. Evarts being also on that side of the case, while Charles O'Conor was retained by the slaveholder. Another case that brought out Mr. Arthur in defense of the colored people was in regard to the provision that they should not ride in New York streetcars, although no separate means of travel was provided for them. One Sunday in 1855 a colored woman named Lizzie Jennings, on her way home from a Sunday-school, of which she was superintendent, was ejected from a Fourth Avenue car. Culver, Parker, and Arthur,

were her counsel in a lawsuit, and as the result the right of colored people to ride in the street-cars was established.

At the beginning of the civil war in 1861, Mr. Arthur, who had been engineer-in-chief on the staff of Gov. Morgan, with the rank of brigadier-general, became acting quartermaster-general. In 1862 he was inspector-general of New York troops in the field. On June 28 of that year, he acted as secretary for the meeting of Governors of the loyal States, held at the Astor House, in New York city. The result of the meeting was a recommendation to President Lincoln to call for troops. When the 300,000 volunteers were asked for, Gen. Arthur resigned his office of inspector, and was again made quartermaster-general. Six months later, when Gov. Morgan was succeeded by Gov. Seymour, he went out of office, and won from his Democratic successor high praise for the condition in which the department was found. He says: "I found, on entering on the discharge of my duties, a well-organized system of labor and accountability, for which the State is chiefly indebted to my predecessor, Gen. Chester A. Arthur, who by his practical good sense and unremitting exertion, at a period when everything was in confusion, reduced the operations of the department to a matured plan, by which large amounts of money were saved to the Government, and great economy of time secured in carrying out the details of the same."

For the next ten years Gen. Arthur practiced his profession, the first four years with Henry G. Gardner, the next five alone, and then he formed a copartnership under the firm-name of Arthur, Phelps, and Knevals.

During all this time he took an active interest in politics, and in 1871 was appointed, by President Grant, Collector of the Port of New York. At the close of a four years' term in that office he was renominated, and confirmed the same day, the Senate waiving the form of referring the appointment to a committee, a courtesy previously shown only to ex-Senators. He had been in office nearly seven years when President Hayes asked for his resignation, and, at the same time, offered him a foreign appointment. The civil-service rules were in force, so that Collector Arthur's removal could not be made except for cause. A committee had been previously appointed to investigate the management of the Custom-House, and they had presented several criticisms; but Gen. Arthur refused to resign, and called for a further committee of investigation. Two such were appointed, and both reported that nothing on which a charge of official unfaithfulness could be based had been discovered. A petition was framed, requesting his retention in office, and signed by all the judges of the New York courts, and most of the men prominent at the bar or in mercantile life in New York City; but it was suppressed by Mr. Arthur. The President and the Secretary

of the Treasury were obliged to withdraw all accusations except that of active participation in politics, Mr. Arthur sympathizing with the Grant or third-term wing of the Republicans. The letter of defense written by the collector opens as follows: "The essential elements of a correct civil service I understand to be: first, permanence in office, which of course prevents removals except for cause; second, promotion from the lower to the higher grades, based upon good conduct and efficiency; third, prompt and thorough investigation of all complaints, and prompt punishment of all misconduct. In this respect I challenge comparison with any department of the Government under the present or under any past national Administration. I am prepared to demonstrate the truth of this statement on any fair investigation." Then follows an array of figures, which proved that the removals for all causes had been only $2\frac{1}{4}$ per cent. against an annual average of 28 per cent. under the three previous Administrations, and 24 per cent. before that time. In making promotions, the uniform practice was to raise men from the lower to the higher grades, and all but two appointments in one hundred, to salaries of \$2,000 and over, had been so made. Gen. Arthur also showed that the expense of collecting had been, during previous Administrations, $\frac{59}{100}$ of one per cent., and during his $\frac{62}{100}$ of one per cent.; yet, six months later, he was removed. In the Republican National Convention that met in Chicago in 1880, Mr. Arthur was a delegate at large. When James A. Garfield had been nominated for President, the New York members presented Arthur's name for the second place on the ticket. The suggestion was well received at once, and after one ballot the choice was made unanimous. On the death of President Garfield, Sept. 19, 1881, Mr. Arthur succeeded to the presidency. It was a time of great excitement and gloomy prediction. Before President Garfield was shot, the two New York Senators, Conkling and Platt, had resigned their seats, after having appealed to the President to withdraw a nomination that was obnoxious to them, the appeal being headed by Vice-President Arthur himself, who even went to Albany to help the Senators in an effort to obtain justification by a re-election, but without success. The emergency of President Garfield's death brought out Gen. Arthur's best abilities, and as he took the oath of office the new President ceased so completely to be the partisan, that the muttered disaffection died away, and the nation settled down into confidence and ultimate admiration. His inaugural (which may be found in the "Annual Cyclopedias" for 1881, page 847) was not more reassuring than his effort to realize it was sincere. The verdict upon his Administration was almost universally favorable. The scholarly, Christian gentleman in private and social life, he was also the wise statesman, and the dignified and representative American, who held broad and conscientious

views in regard to the interests of the whole country. The notable acts of his Administration are recorded under their appropriate heads in the "Annual Cyclopaedia" for 1881-'85.

At the expiration of his term of office he returned to his home in New York city. About a year afterward he suffered a serious attack of illness, and although from that time he had been compelled to use precautions in regard to his health, his death was finally a surprise to the community. The funeral services, both in New York and in Albany, where the interment took place, were marked by extreme simplicity, and were at the same time notable for the number of eminent men that were present. Mr. Arthur was a widower at the time of his election to the vice-presidency, his wife having died about a year before that event. She was a daughter of Commander Herndon, a naval officer, who explored and wrote of the valley of the Amazon, and who perished with the steamer "Central America," which went down in the Gulf of Mexico with 426 souls on board. The ex-President left a son and daughter. (For portrait, see "Annual Cyclopædia" for 1881.)

ASPINWALL. It was estimated that the number of inhabitants in the city called by Americans Aspinwall, and by the natives Colon, had reached 10,000 when the calamitous events of the spring of 1885 occurred. The manner in which Aspinwall became a mass of ruins, and the events as they took place in chronological order, are here presented, with a brief review of the circumstances leading up to the termination that embarrassed the operations of five great business enterprises at an expense to them of millions of dollars. On March 26, 1885, Capt. John M. Dow, representing the Pacific Mail Steamship Company in Aspinwall, received a letter dated the previous day from the sub-Secretary of the State of Panama, by direction of the citizen-President, informing him that the delivery of war materials to consignees at either Colon or Panama was absolutely prohibited, and that if such articles should come by the steamers of the Pacific Mail Steamship Line they must be held in deposit and the Government advised of such arrival. In these preliminary arrangements Capt. Dow acquiesced; but in the mean time the citizen-President, Dr. Arosemena, had resigned his office, and on the 27th Capt. Dow received a letter from the Secretary-General of the Citizen Commander-in-Chief of the Third Division, Gen. Gonima, acquainting him with the fact that he, the commander-in-chief, by decree of the 26th instant, had assumed the position of civil and military chief of the State, and informing him that, in case the rebels should attempt to remove arms and munitions of war from the steamers, the agent might ask protection from the American or French vessels of war on the part of Colon. On the 30th the steamer "Colon" arrived from New York. She belonged to the Pacific Mail Line, and Capt. Dow found a shipment of fifty-

two packages marked "M" (in a diamond), "Colon," consigned to order. His instructions were not to deliver these or any other arms and munitions of war from the ship without orders from the U. S. consul or Commander Kane, of the U. S. steamer "Galena." On the way to Panama, for which place he set out on the same day, he was overtaken by a telegram from George A. Burt, General Superintendent of the Panama Railroad, saying that the Pacific Mail wharf was in the possession of an armed force under Prestan; that Mr. Connor, agent of the Pacific Mail Steamship Company, was under arrest; that the United States ensign hung union down at the fore of the "Colon"; that the U. S. consul, Mr. Wright, was on board the ship; and Commander Kane, of the "Galena," in company with the commander of the British war-vessel "Lily," had just left his office to go on board ship and take an armed force to the "Colon" by boat. Capt. Dow took the next train back, and arrived at Colon at 2.30 p. m. Before three o'clock he received a call at his office from Prestan, who asked that the arms and ammunition should be delivered, presenting an indorsed bill of lading. Capt. Dow told Prestan he had no authority to deliver the shipment without an order from the U. S. consul or Commander Kane, of the "Galena," as he had been directed by the U. S. consul, Mr. Wright, under instructions from the U. S. consul-general at Panama, Mr. Adamson, not to deliver the goods under any circumstances. Mr. Burt went to the wharf to ascertain where the packages were stowed, and Prestan called a squad of men, and, arresting Capt. Dow and the rest of the party, marched them into the street, and, looking in the direction of the "Galena," said to the guard in Spanish, "At the first gun you hear fired from the vessel, shoot these men." Permission was given, however, to Ensign Richardson to report the arrest to Commander Kane, and he went out to the ship, while the others were taken to the guard-house, where they found Mr. Connor, who had been under arrest since noon. After an hour's confinement, Consul Wright consented to allow the packages to be delivered, as the only means of releasing the party, and they repaired under escort to the wharf, and Lieut. Judd was permitted to go on board the "Galena." Capt. Dow returned to his office and Mr. Connor superintended the work of delivering the goods, the steamship's wharves being in the possession of Prestan's officers and men, numbering 100. At 6.30 p. m. Prestan sent an officer and two men to Capt. Dow's office, saying that a movement was going on at the "Galena" as if manning boats, and he was wanted at the wharf. In about half an hour some boats' crews from the "Galena" boarded the "Colon" on her off-shore side, on seeing which Prestan retired from the wharf, taking Capt. Dow and Mr. Connor with him, and confined them in their former quarters a few hours, March 31, when they were

taken to the outposts of the rebel forces beyond Monkey Hill and confined in a cane hut. Not more than half an hour had elapsed when the rebels were surprised by the Government forces, and the prisoners escaped. After traveling five miles on foot, Capt. Dow reached the "Galena" at 7 A. M., and Mr. Connor went on board the "Colon" at 8 A. M. of March 31. Lieut. Judd, showing signs of insanity upon his release, was sent home on the "Colon" to New York, and was cared for at the Naval Hospital. For eighteen months previous to the Isthmian trouble he had been navigating officer of the "Galena." In January, 1885, there were many indications that a civil war was imminent. Political affairs were much disturbed, and there was serious apprehension that the revolutionists from the coast might make a descent upon Colon. At the request of Gen. Santo Domingo Vila, a force of U. S. marines commanded by Capt. Clarke was landed at Colon from the American man-of-war "Alliance" to guard the railroad and canal property there, and to guarantee the integrity of transit. Señor Pedro Prestan took peaceful possession of the city of Colon. On March 16 he sent a notice to Mr. Burt, Superintendent of the Panama Railroad, announcing that he had been proclaimed, by the unanimous voice of his fellow-citizens, the civil and military chief of that department, and had accepted. He also addressed the British consul at Colon, requesting that the arms on board the British steamer "Alene" should be delivered. The arms had not been landed in Cartagena on account of Gaitan's successes. On March 19 an appeal was made by the President of the State, who called a meeting of business men, for funds to be employed solely in maintaining order on the Isthmus. March 20, Prestan believed he could reckon on 413 men, abundant arms, and four cannon. He was now understood to be associated with Gen. Aizpuru, then in the city of Panama, and acting under orders of that commander.

On the resignation of Dr. Pablo Arosemena, President of the State of Panama, which took effect on the 26th, Gen. Gonima assumed command as civil and military chief, and appointed Gen. Buenaventura Correoso his secretary-general. Prestan's next move was to refuse to forward the mails to Cartagena from Panama *via* Colon. On the 26th, Gen. Gonima issued a decree, declaring that the Isthmus would remain neutral in the revolution now taking place in the interior of the republic, and on the same day he assumed the position of civil and military chief of the national army. March 28, by order of Prestan, a notice was posted on the door of the Panama Railroad freight-room, to the effect that a sale of merchandise belonging to Messrs. Zubierta and Pasos would take place that day, until the amount demanded as a forced loan should be paid. The auction-sale began, but some satisfactory arrangement having been made, it was

summarily closed. This is a good example of the system of taxation resorted to, whenever the party out of power desires to take measures to get in. March 30, Prestan, with eighty soldiers, determined to resist the landing of American marines, and said that, if any man-of-war's boat should attempt to land, he would fire into the boat, but, if the captain desired to come on shore, he could do so under a flag of truce. On the afternoon of March 31, fire broke out in the Government building on Bolivar Street, the entrances of which were defended by cannon behind barricades. The wind blew from the north, and all south of this point was destroyed. The Pacific Mail Steamship wharf was saved by a change in the wind. Two steam fire-engines were destroyed. The principal losses were suffered by the railroad and canal companies, and the Royal Mail Company. The Boston Ice Company were heavy losers. The superintendent of the railroad sent a messenger to Gatun (the telegraph wires being cut), for supplies for the poor and needy, and a relief-train with provisions was dispatched, and it was met at Gatun by Mr. Burt, with a guard of marines from the "Galena," who took the car to Colon. Prestan, having been defeated by the Colombian guard under Col. Ulloa and Sergeant-Major Brun, reduced the town to ashes and then fled. Men found in the act of setting fires were summarily shot by the Colombians. American employés gave notice that they would leave the Isthmus unless the United States Government sent a sufficient force to afford protection. When the news reached the Navy Department at Washington, the "Tennessee," the "Alliance," and the "Swatara," were ordered to Colon; and the "Iroquois," the "Wachusett," and the "Shenandoah," to Panama. Marines were forwarded by the passenger-steamer, and three hundred mechanics went down to assist in building up the ruined city. A large part of the men belonging to the Second Battalion of Marines, which arrived from New York April 16, occupied points of importance in and about Colon, and the remainder were stationed at Matachin, and at San Pablo bridge. For the crime of setting fire to the city of Colon, the notorious Haytian Gen. Pautrizelle, and his associate, Cocobolo, were executed May 9, on a gallows built over the railroad-track, opposite the site of the old calaboose. Pautrizelle laid the responsibility for his crime on his superior officers. The incendiaries were arrested by Lieut. Robert M. Doyle, April 1, twenty-four hours after their accomplices had fled with Prestan. They were tried by court-martial, and condemned by the Colombian Government. Gen. Gonima was deposed and banished. Don Pedro Prestan was captured at San Martin in August, and on the 11th arrived at Colon under guard. August 17 a council of war assembled on the spot where the city once stood, to decide the fate of the principal agent in its destruction. At 7.30

P.M., on the evening of the same day, Prestan's death-warrant was signed, and at midday of the 18th he was executed. On account of the political disturbances, an additional tax was levied upon the merchants, making a double contribution for the year.

ASSOCIATIONS FOR THE ADVANCEMENT OF SCIENCE.

American.—The thirty-fifth annual meeting began Aug. 18, 1886, at 10 A. M., in the hall of the High-School in Buffalo, N. Y. The chair was resigned by Prof. H. A. Newton, former President, to Prof. Morse, of Salem, Mass., the President-elect. The following is the list of officers for the meeting: President, Edward S. Morse, Salem, Mass. Vice-Presidents of Sections: Section A. Mathematics and Astronomy, J. W. Gibbs, New Haven, Conn.—B. Physics, C. F. Brackett, Princeton, N. J.—C. Chemistry, H. W. Wiley, Washington, D. C.—D. Mechanical Science, O. Chanute, Kansas City, Mo.—E. Geology and Geography, T. C. Chamberlain, Washington, D. C.—F. Biology, H. C. Bowditch, Boston, Mass.—H. Anthropology, Horatio Hale, Clinton, Can.—I. Economic Science and Statistics, Joseph Cummings, Evanston, Ill.

The meeting was attended by 442 members, and 142 new members were elected; 263 papers were read in the different sections. Several excursions were provided for by the local committee. The Botanical and Entomological Clubs of the Association also held meetings during the convention.

Prof. C. F. Brackett, of Princeton College, Vice-President of the Physical Section, spoke of the seat of electromotive force in the voltaic cell. The question whether the current was due to chemical changes, or to contact of dissimilar substances, was considered, but no satisfactory conclusion was reached.

The Vice-President of the Mechanical Science Section, O. Chanute, Esq., of Kansas City, devoted his address to the progress of mechanical science. He alluded to the slow progress of the steam-engine from the time of Hiero to the days of Watt, and to the latter's improvements, that made it nearly twelve times as economical. He traced Watt's success to his intercourse with scientific men in Glasgow University. He also traced the rapid development of the artificial ice industry, in a practical sense, all included in the past sixteen years.

The vice-president's address in the Anthropological Section was given by Horatio Hale, "On the Origin of Language and Antiquity of Speaking Man." It was based on the language-making instincts of children, instances being given of children's languages, new and peculiar to the two individuals using them. From the structure of ancient skulls an attempt was made to prove that language was a recent and integral acquisition by man, and the theory was broached that it came at once perfect and ready for use. Dr. Daniel G. Brinton, of Philadelphia, read a paper on the Maya and Mexican dialects. Mr. T. C. Mendenhall read a curious

and interesting one on the characteristic curves of composition. Using the numbers of letters in words as abscissæ, and the frequency of occurrence of words of each length as ordinates, he constructed curves from different authors' works. From 10,000 words a regular curve could be obtained. Mrs. Nuttall Pinart spoke of Mexican inscriptions, and created much interest by her treatment of the subject from a phonetic standpoint.

The Biological Section was addressed by its vice-president, Dr. H. P. Bowditch, of Boston, on "What is Nerve-Force?" It is not electrical, as it is too slow in transmission, and the nerves are not insulated. The chemical and the kinetic theories were spoken of, and the latter was favored.

In the Geological Section the interest centered in the excursions to and papers on the Niagara gorge. The conclusions reached in one paper, read by Mr. Woodward, amount in general to this: that the gorge was due to the action of the falls for about 7,000 years, and that its rate of recession averages about $2\frac{4}{5}$ feet per annum. Mr. A. A. Julian read a paper on "The Examination of Building-Stones for Absorption, Freezing, and Fire." Papers were also read by Dr. Newberry, Prof. Claypole, and others.

In the Chemical Section a committee from the Washington Chemical Society, consisting of Dr. A. C. Peale, W. H. Seaman, and C. H. White, suggested the adoption of a uniform scheme for presenting the results of water-analysis. No final action was taken, the subject being referred to a special committee. Miss Helen S. de S. Abbott read a paper on "The Proximate Composition of a Honduras Bark, Chichipati." In it she found a new coloring-matter, which she named *chichipatin*. Prof. H. Carrington Bolton presented a report on "Indexing Chemical Literature." Mr. O. F. Mayberry read a paper on "The Products of the Cowles Smelting-Furnace." One of its products, an alloy of 10 per cent. aluminium and 90 per cent. iron, is used in making "mitis castings," as a vehicle for adding a small percentage of aluminium to iron. Another compound, of silicon, aluminium, and copper, was described, resinous in color, and decomposing water at 100° . Prof. V. C. Vaughan spoke of tyrotoxicon, the poisonous substance sometimes present in cheese, and perhaps also in ice-cream.

In the Physical Section, Prof. John A. Bra-shear described an apparatus for making the sides of glass plates parallel—the gravity parallelogram. The two surfaces of a plate about one quarter of an inch thick could be made so parallel that, if extended, they would not come together for five miles. Prof. W. A. Rogers described a combined yard and meter, to be used by the Department of Standards of the British Board of Trade. The last determination of the meter was given as 39-37012 inches. Prof. J. N. Sanborn read an interest-

ing paper on the relation of dew to soil-moisture. He maintained that dew, as a rule, did not prevent the drying of soil; that it kept drying during heavy dews. The subject of "Dew Formation" was further treated by Major H. E. Alvord. Prof. T. C. Mendenhall spoke on "Electrical Thermometry."

The titles of a few other papers follow: "On Devonian and Carboniferous Fishes," and "On the Cretaceous Flora of North America," J. S. Newberry; "Fossils from the Taconic," J. D. Dana; "Memoranda of a Revision of the North American Violets," Asa Gray; "Work of the United States Department of Agriculture in Economic Ornithology and Mammalogy," and "Do any of Our North American Bats migrate? Evidence in the Affirmative," C. Hart Merriam; "A Trilobite Track illustrating the Mode of Progression of the Trilobite," N. S. Ringueberg; "Synopsis of North American Pines based on Leaf Anatomy," John M. Coulter and J. N. Rose; "On Gold and Silver Ornaments from Florida" and "Gold Ornaments from the United States of Colombia," George F. Kunz.

The following officers were elected for the next meeting: President, S. P. Langley, of Allegheny, Pa.; Vice-Presidents, A. Mathematics and Astronomy, William Ferrel, of Washington, D. C.; B. Physics, William A. Anthony, of Ithaca, N. Y.; C. Chemistry, Albert B. Prescott, of Ann Arbor, Mich.; D. Mechanical Science and Engineering, Eckley B. Coxe, of Drifton, Pa.; E. Geology and Geography, G. K. Gilbert, of Washington, D. C.; F. Biology, W. G. Farlow, of Cambridge, Mass.; H. Anthropology, D. G. Brinton, of Media, Pa.; I. Economic Science and Statistics, Henry E. Alvord, of Amherst, Mass.; Permanent Secretary, F. W. Putnam, of Cambridge, Mass.; General Secretary, W. H. Pettee, of Ann Arbor, Mich.; Assistant-General Secretary, J. C. Arthur, of Geneva, N. Y. Secretaries of the Sections: A. Mathematics and Astronomy, Henry M. Paul, of Washington, D. C.; B. Physics, C. Leo Mee, of Athens, O.; C. Chemistry, C. F. Mayberry, of Cleveland, O.; D. Mechanical Science and Engineering, George M. Bond, of Hartford, Conn.; E. Geology and Geography, T. B. Comstock, of Champaign, Ill.; F. Biology, J. Henry Comstock, of Ithaca, N. Y.; H. Anthropology, F. W. Langdon, of Cincinnati, O.; I. Economic Science and Statistics, W. R. Lazenby, of Columbus, O.; Treasurer, William Lilly, of Mauch Chunk, Pa.

British.—The fifty-sixth annual meeting of the British Association for the Advancement of Science was held at Birmingham, England. The attendance was 2,500. The new public buildings of Birmingham and its leading club-houses were thrown open to the members. It was the fourth Birmingham meeting. The next place for assembling is Manchester, on Aug. 31, 1887. A subsidiary meeting of the Association is to be held in Sydney, New South Wales, in January, 1888, to which a deputation of forty of the most eminent members of the

society is to be sent, at the expense of the colony. The work done is to be reported at the regular 1888 meeting in Bath.

Lord Raleigh, the retiring president, resigned the chair to Sir William Dawson, Principal and Vice-Chancellor of McGill University, Montreal, whose inaugural address began with a tribute to the great advance in English scientific teaching, the Mason College founded in Birmingham by one of her manufacturers, Sir Josiah Mason, being particularly instanced. His guarded allusion to the Darwinian theory was interesting as one of the prominent expressions concerning it given at this meeting. He expressed doubts as to its satisfactory elucidation of proof. The body of the address was devoted to the geology of the North Atlantic, based on the prevalent conception of the earth's constitution as comprising a solid nucleus, covered by a plastic envelope, and that by the crust on which we live. The plastic envelope he held to be in a state of hydro-thermic fusion. Many of his conclusions were seriously modified by the deductions necessarily following on the Charleston earthquake. The day after his address, when the news had reached England, Prof. Dawson himself published the statement.

In Section A, devoted to mathematical and physical science, the president's address was delivered by Prof. G. H. Darwin, "On Estimations of Geologic Time." An interesting synopsis of the different bases for its calculation was given. The erosion of a river-bed in rock went on at the rate of one foot in from 1,000 to 7,000 years. The antiquity of life on the earth, he said, might be placed between thirty-six and ninety-eight million years. Mr. Croll's astronomical determinations of epochs, and Sir James Thomson's atmospheric current determinations, were next considered. Sir William Thompson's three methods of arriving at these factors, by applying the laws of energy, were commended, but only as attempts, not as definite successes. The first one, based on tidal friction, bringing about a retardation of the earth's motion, the second on the secular cooling of the earth, and the third on the loss of radiant energy of the sun, comprise the three. The first conclusion arrived at was that there was no certainty on the subject.

The president's address in Section B, devoted to chemistry, was delivered by Prof. William Crookes, on "The Genesis of Chemical Elements." He began by citing the many eminent authorities who had hoped for the reduction of all elements to one. He compared the elements in their distribution to the members of the animal kingdom, the rarer ones to the rare animals as to the *monotremata*, and hence drew a plea for the evolution of the elements. He suggested the word *protole* (*πρῶτος, first, and ἄλη, stuff*) for the primal element. It compares with the protoplasm of biology. Prof. Emerson Reynolds's ingenious diagram, elucidating

Mendelejeff's law, was commended, and used for the advancement of the speaker's ideas.

The president's address in Section C, devoted to geology, was given by Prof. T. J. Bonney on "The Application of Microscopic Analysis to Geology." It was based largely on the fact that the physical or mechanical changes in particles of agglomerated rocks could be determined by the microscope. In quartzites and sandstones the attrition received by the grains before agglomeration could thus be studied, illustrating their origin, the wind and water action to which they had been subjected, the distance traveled, etc. The rocks of England were considered from this standpoint, and deductions made in conclusion as to points in their physical geology.

The president's address in Section D, devoted to biology, was given by Prof. William Carruthers on "The Relation of Existing Vegetation to Past Flora." The material could not be found in herbariums, as the oldest in existence only dated back to 1646. But specimens from the sepulchres of Egypt collected and prepared by Dr. Schweinfurth had given the finest material for this work. He had found in the wreaths and floral decorations of mummies samples that, treated with hot water, could be perfectly mounted, in some cases giving the color of the original. These were supplemented by specimens from American mounds and Swiss lake-dwellings, and showed no difference of any moment from existing vegetation. Even seeds of weeds that to-day annoyed cultivators were found mixed with wheat and flax-seed from these sources. Hence the conclusion was drawn that species must be dealt with as fixed quantities. The conclusion was in the line of Prof. Dawson's argument.

Section E, devoted to geology, was presided over by Maj.-Gen. Sir F. J. Goldsmid, who in his address made a plea for the more thorough teaching of this science in the schools.

In Section G, devoted to mechanical science, Sir James N. Douglass delivered the president's address, on lighthouses. Some interesting dates were first given, and experiments with different lenses and lights, and the system of photometry, were described. The conclusions definitely reached by the highest authorities, and that might be considered settled, were that for ordinary purposes mineral oil was most suitable and economical, and for headland lights electricity was best.

The president's address in Section H, devoted to anthropology, was delivered by Sir George Campbell. He advocated a more popular study of the science, claiming that popular data were the best, and were superior to craniology and the more abstruse methods. India was mentioned as a field for the study. The good to be done in elevating the race of man by scientific intermingling of different races was spoken of, we having no reason to believe that man has made any advance in the past 4,000 or 5,000 years. Some of the general

race tendencies were considered, as that of the English to misplace the aspirate. A more universal study of practical anthropology was finally recommended.

Among the many numerous reports of committees, those "On Fossil Plants in the Tertiary and Secondary Beds of the United Kingdom," "On the Caves of North Wales," and "On the Depth of Frozen Soil," may be particularly aluded to. Grants aggregating £1,300 were made to the committees for work in the ensuing year.

ASTRONOMICAL PROGRESS AND PHENOMENA.

The progress in astronomy, both theoretical and observational, during the past twelve months, appears to have been equal to that of any recent year.

The Solar Parallax.—The determination of the earth's distance from the sun, the late astronomer royal pronounced the grandest problem of astronomy. It was formerly supposed that the transits of Venus furnished the most trustworthy data; but the results of four transits have been very discordant, and as another will not occur until after the lapse of one hundred and eighteen years, astronomers have turned their attention to other, and, it may be, more exact processes. The determination of the velocity of light gives, perhaps, the most accurate value of the sun's distance of any that have been tried, and, as between that and other methods, there is happily a close agreement, which lends an additional assurance that, within narrow limits of error, the solar distance is known. Adopting $20^{\circ}49'2''$ as the constant of aberration, Prof. Newcomb makes the velocity of light *in vacuo* 299,860 kilometres (= 186,330 miles) a second. Taking the earth's equatorial radius as 3,963.296 miles, gives the solar parallax the value of $8^{\circ}794'$, and the sun's mean distance from the earth, in round numbers, 93,000,000 miles, which is the base-line for all celestial measurements except those relating to the moon. The official solar parallax adopted in England, is $8^{\circ}848''$, being the result of the reduction of all the observations of the transit of Venus of 1874. But from Dr. Gill's observations of Mars, and of some of the asteroids at their oppositions while in perihelion, this parallax is too large; and he strenuously contends for one smaller and more nearly conformable to that obtained by Prof. Newcomb. This corrected value somewhat reduces the supposed solar diameter, making a second of arc on the sun almost exactly 450 miles instead of 460, as resulted from the old assumed distance of 95,000,000 miles. It also diminishes the computed distance of all the stars, and the magnitudes and distances of all the planets from the sun, and of the satellites (except our own), from their primaries.

The Sun.—In all ages, the cause of the sun's heat, light, and actinism, as well as of his spots, has been a fruitful theme for the study of physicists. But few theories to account for

them that met with general acceptance have, until recently, been promulgated. For several years past, Prof. S. P. Langley, director of the observatory at Allegheny, Pa., has been assiduously engaged in the study of solar physics, and, with a new and ingenious instrument of his own invention, called a bolometer, has contributed to science many valuable facts, some of which entirely controvert theories that were considered invulnerable. The results of his investigations have lately been published in vol. xv of the "United States Signal-Service Reports." From observations at the Allegheny Observatory, and on Mount Whitney, he made the solar constant 2.84 calories, which heretofore was considered much less. In 1878, from the summit of Pike's Peak, during the total eclipse of that year, he investigated the solar spectrum, and proved that the rays of the "great group A" were double. He has shown, also, by the bolometer, that the sun's heat has been underestimated by 50 per cent. This wonderfully delicate and sensitive instrument has enabled him to measure with precision the undulations of long wave-lengths below the visible red, to the extent of forty times as great as was known to other solar physicists; and it promises, in his hands, to add much more to our knowledge of the sun and his immediate surroundings.

Eclipses.—In the year 1886 there were two eclipses; and, as is always the case under such circumstances, both were of the sun. The first, occurring on March 5, was annular, and, except across the southern portion of Mexico, its annular phase was in a path wholly oceanic. No effort was made by astronomers to observe it, as such eclipses are nearly barren of valuable results. Now, however, in view of the fact that Dr. Huggins is quite certain of his success in photographing the solar corona in presence of an unclipped sun, and that he would be doubly assured were he permitted to try his experiment when all but its circumferential portion was hidden by the moon, future eclipses of this character must have a value of their own. The second eclipse, which took place on Aug. 28 and 29, was total, and, in respect to duration of totality, was one of the most remarkable of modern times, though, unfortunately, like its predecessor, its path of total eclipse, except near the beginning and ending, was entirely on the ocean. The island of Grenada, in the Caribbean Sea, and one or two other small islands adjacent, were the only places in this hemisphere for observing it to advantage. No efforts were made by American astronomers to secure observations of this rare phenomenon, though the islands were occupied by several parties from Europe. At most of these stations the sky was clear, and important results were achieved, a brief summary of which is subjoined, though, being unofficial, it may require modification. Prof. Tecchini, during totality, observed the prominences with a 6-inch telescope. After to-

tality, he reobserved them with the spectroscope, and found, to his surprise, that, seen under these two different conditions, and by such different methods, they were not the same. Hence we conclude that a spectroscopic observation of an unclipped sun reveals only a part of what is seen with a telescope during an eclipse. This is an important addition to our knowledge of these enormous clouds that are seen during all eclipses floating in the sun's atmosphere, sometimes to a height almost equaling the moon's distance from the earth. About twenty photographs of the corona were secured, on five of which the chromosphere is depicted. The famous line 1474 was seen two minutes before totality. At the close of last year's report, on "Astronomical Progress and Phenomena," no news had been received from the observing parties that went to New Zealand to observe the total eclipse of Sept. 9, 1885. From published reports it does not appear that that eclipse added much to what was already known. The serrated appearance of the corona was, as in other eclipses, a distinctive feature and easily observable. Shortly before totality the rare phenomenon of the projection of the moon's contour on the background of the bright corona was seen.

Naked-Eye View of the Corona.—Mr. Ford having made the improbable statement that the sun's corona could, in a clear sky, and without an eclipse, be distinctly seen from the top of a high mountain with the naked eye, Sig. F. Tecchini, successor of Secchi, at the observatory of the Collegio Romano, has published a confirmation of the strange announcement. From the summit of Mount Etna, on two different days, he observed the phenomenon, which presented the appearance of a white ring, surrounded by a splendid copper-red corona. Probably the spectacle witnessed by both observers was "Bishop's ring," a supposed accompaniment of the recent sky-glow which, at the time, was visible even from the surface of the earth.

Sun-Spots and the Weather.—The influence of the spots on the solar surface upon the weather of our planet still continues to agitate the popular mind. Ever since the invention of the thermometer it has been proved that the annual amount of heat that the earth as a whole receives is a constant quantity, and that it is undeviatingly the same through the periods of sun-spot maxima and minima. Jelenek, of Prague, has tabulated all the observations he could collect in Germany, extending over one hundred years, and after a complete discussion of them has come to the conclusion that there is no correspondence whatever between sun-spots and the weather. Some enthusiasts have even gone so far as to connect these spots with cyclones, rainfalls, financial crises, epidemics, the price of grain, etc. This, though fine theorizing, is not science.

Minor Plants or Asteroids.—Since vol. x of the "Annual Cyclopædia" went to press, fourteen

of these bodies have been discovered. Following is the list, with their numbers, the dates of their discovery, and the names of their discoverers. Nos. 249 and 250 belong to last year's list, but were then unnamed:

No.	Name.	Discoverer.	Date of discovery.
249.....	Ilsa.....		
250.....	Bettina.....	Palisa	Oct. 4, 1885.
251.....	Sophia.....	Palisa	Oct. 27, 1885.
252.....	Clementina.....	Palisa	Nov. 12, 1885.
253.....	Mathilda.....	Palisa	March 31, 1886.
254.....	Augusta.....	Palisa	March 31, 1886.
255.....	Oppavia.....	Palisa	April 3, 1886.
256.....	Unnamed.....	Palisa	April 5, 1886.
257.....	Silesia.....	Palisa	May 4, 1886.
258.....	Tyche.....	Luther	June 23, 1886.
259.....	Abethela.....	Peters	
260.....	Huberta.....	Palisa	Oct. 3, 1886.
261.....	Unnamed.....	Peters	Oct. 31, 1886.
262.....	Unnamed.....	Palisa	Nov. 3, 1886.
263.....	Unnamed.....	Palisa	Nov. 3, 1886.
264.....	Unnamed.....	Peters	Dec. 22, 1886.

Comets.—The following-named comets have been discovered since the last report. They are enumerated, as all comets should be, in the order of their discovery, thus saving much confusion and alteration of numbers.

Name of discoverer.	Date of discovery.
Fabry.....	Dec. 1, 1885.
Barnard.....	Dec. 3, 1885.
Brooks.....	Dec. 26, 1885.
Brooks (1).....	April 27, 1886.
Brooks (2).....	May 1, 1886.
Brooks (3).....	May 22, 1886.
Winnecke's periodic, by Finlay.....	Aug. 1886.
Finlay.....	Sept. 26, 1886.
Barnard.....	Oct. 4, 1886.

The first two were remarkable in respect to the brilliancy to be attained about the time of perihelion passage, but, unfortunately, both at that time were so near the sun as to be seen with difficulty, notwithstanding their intrinsic brightness. According to the ephemeris of Dr. S. Oppenheim, the theoretical brightness of Fabry's comet on May 1, 1886, was 461, its brightness at discovery being taken as unity, and that of Barnard's 371. The prediction that the world was to be treated to the unheard-of spectacle of two comets simultaneously visible, which in splendor would probably surpass any seen in recent times, aroused great curiosity, which was followed by disappointment correspondingly great at the failure of its accomplishment. It is not always that comets appear as bright as theory demands, and, owing to the position relative to the sun and the earth, they sometimes are not seen at all, even with the telescope. For a like reason, a comet that has for its period a mixed number of years, as five and a half, six and a half, etc., can ordinarily be seen only at alternate apparitions. As a late instance, Swift's periodic comet of 1880, whose period is about five and a half years, was seen in 1869, but escaped detection at its approach to perihelion in 1874, and also in 1886. In 1891 it will be on the same side of the sun as the earth, and will, therefore, be in the best position possible for observation and early detection. At its perihelion passage in May, 1886, its theoretical

brightness was only 0.086, that of 1880 equal to unity.

Winnecke's periodic comet was detected by Finlay at the Cape of Good Hope on Aug. 19, 1886. This comet was first seen by Pons on June 12, 1819, and not again observed until rediscovered by Winnecke on March 8, 1858. At its next return it again escaped detection, but was refound by Winnecke in 1869. In 1875 it again eluded observation. This is its fifth observed return. Its periodic time is 5.64 years, subject to some variation by the influence of Jupiter. It is now visible in the evening sky, low in the south, as a very faint nebulous object.

In the last volume, the number of periodic comets was given as sixteen, counting Biela's lost divided comet as two. The later discoveries increase this number to eighteen, viz., Brooks's third and Finlay's, which is a return of De Vico's lost comet of 1844 (?). Of course, Brooks's comet has not been seen to return to perihelion; but there is among astronomers such a close agreement in regard not only to periodicity, but also to its length of period, that there can be little doubt of the fact. And the same may be said of Barnard's, Wolf's, and Denning's comets. The following are the elliptic elements of Brooks's periodic comet, by Dr. S. Oppenheim:

Time of perihelion passage = T	June, 6.815958 (Berlin mean time).
Distance from node to perihelion = $\pi - \Omega$	176° 50' 18.3".
Longitude of node = Ω	62° 5' 56.2".
Inclination = i	13° 23' 48.0".
Logarithm of perihelion distance = q	0.138857
Logarithm of eccentricity = e	0.836962
Logarithm of mean distance = a	0.637824
Period.....	9.05 years.
Motion direct = +	

The elements of Finlay's comet, by Dr. A. Krueger, are :

T = ..	1886, Nov., 22.234427 Berlin mean time.
$\pi - \Omega$ = ..	316° 4' 15.7".
Lon. Ω = ..	59° 11' 49.4".
i = ..	2° 59' 24.6".
Log. a = ..	0.11116
Period.....	5.4 years.
Motion +	

Prof. Boss, who first suggested the identity of Finlay's comet with De Vico's, has computed for it another set of elements, making its period 4.32 years. If this be confirmed, it becomes, except Encke's, the shortest period comet known.

During 1885, seven comets, including one periodic (Tuttle's) were seen and carefully observed; while one, a well-known periodic (Tempel's, 1867, II) was not found. It was a faint object, and unfavorably situated for observation. It has a period of almost exactly six years. Thus far in 1866 (Dec. 5) six have been discovered, including one periodic (Winnecke's), while another periodic (Swift's) has eluded search. For the past two years the number has been above the yearly average. The greatest number ever seen in any calendar year is eight, and that only three times, viz., in 1846, 1858, and 1881. Olbers's comet of

1815, expected now at any time, is the most interesting of those unverified by return. When it appears—and it may be delayed until 1887—it will add another to the list of known peridics, and increase to three the number of those of long-period, viz., Halley's, Pons-Brooks's, and Olbers's, the average period of the three being about 73 years \pm . The next shorter is Tuttle's, of 13 $\frac{1}{4}$ years, and the shortest of all is Encke's of 3.3 years.

Celestial Photography.—The interest attaching to this subject, which has had a trial long enough to establish its merits, is unabated. Since the great and unexpected success of the brothers Henry, in photographing stars and nebulae invisible with the visual telescope, other astronomers have entered upon the work, and still others, armed with telescopes larger than that used by those gentlemen, are preparing to follow. Its scope is wide, and promises rich return.

The detection of a nebula by the telescope, or by photography, in this age of astronomical activity, is an unimportant event, but the finding of one in the Pleiades, in close contact with one of the principal stars of the group, which the closest scrutiny of the great telescopes of the world had failed to reveal, is certainly wonderful, and raises the hope that by this method many of these bodies, otherwise unknowable, may be detected. The priority of this discovery, however, really belongs to Prof. E. C. Pickering, of Harvard College Observatory, as it was on his photographic plate that it was first depicted, though he then—as, at its first appearance, did afterward the Henrys—ascribed it to an accidental stain, or to the intrusion of false light. However, after three exposures, on as many different occasions, when the intruding blur presented itself each time in the same place and with similar contour, they were forced to the conclusion that it was the delineation of a real object. This conclusion has been visually verified by Prof. Struve with the 30-inch refractor, and by others possessing large telescopes. The shape of this nebula is unique. It appears to be spiral, and is almost in contact with Maia, one of the six naked-eye stars of the Pleiades. Merope, also of this constellation, is surrounded with a nebula, which extends to a considerable distance south of the star. The exceedingly faint, nebulous body between Merope and Alcyone, discovered by Mr. Commons, has also been photographed, and its existence, so long doubted, is proved. At the November meeting of the Royal Astronomical Society, Isaac Roberts read a paper on photographing the Pleiades, wherein he says, "After an exposure of 89 minutes, the plate showed clearly that the stars Alcyone, Maia, Electra, and Merope, are surrounded by nebulae." On another plate, exposed for three hours, the nebulosity is seen to extend in streamers and in fleecy masses nearly filling the spaces between the stars named, and in places far beyond. He expresses the opinion that the

entire cluster is situated in one vast nebula. Hyperion, the last-discovered and the faintest satellite of Saturn, and the satellite of Neptune in any part of its orbit presented to us, are somewhat easy subjects for the celestial photographer. The Henry brothers have given to the Paris Academy a single plate, of an hour's exposure with their 13-inch reflector, on which may be counted five thousand stars between the sixth and fifteenth magnitudes. The plate embraces $2^{\circ} 15'$ in right ascension, and 3° in declination of a region near the Milky Way, which is rich in stars. Mr. Roberts has succeeded in greatly reducing the time of exposure, having photographed with his 20-inch reflector small stars in fifteen minutes, while Admiral Mouchez recommends an exposure of from one to three hours, which is largely in accord with the practice of the brothers Henry. One grand desideratum in this unspeakably useful adjunct to astronomical science remains to be achieved, viz., the invention of a process for printing directly from the photographic plates, thus absolutely perfecting cartography. Besides the construction of star-charts, photography opens up an avenue to the discovery of satellites and asteroids, and, not impossibly, a trans-Neptunian planet. That the stars are stationary is well known, and consequently their images on the photographic plates will be points; but the impression of all moving objects will be lines, whose length will depend upon the time of exposure of the plate and the velocity of the object. Should, therefore, the photographer find a short line recorded on his plate, out of the immediate neighborhood of a planet, he may be quite sure that an asteroid (perhaps a new one) has impressed its image there. It is doubtful if the motion of a planet beyond Neptune would be rapid enough to produce a line unless the exposure were greatly prolonged.

Mars may have more moons than Deimos and Phobus; Saturn is supposed to possess three or four undiscovered satellites; and so, also, though too faint for the visual telescope, photography may yet reveal the existence of several more satellites about Uranus and Neptune. It is worthy of notice that M. Gothard's attempt to photograph the Swan nebula was a failure, not a trace being visible; whereas every star, even the faintest, was clearly and accurately revealed. This is remarkable, as the nebula is one of the brightest. On the other hand, the great nebula in Andromeda, and the ring nebula in Lyra, show very strongly with shorter exposure.

A lively controversy has been carried on between Mr. Huggins and Prof. W. H. Pickering, as to the reality of the faint markings found by the former on the plates after his attempts to photograph the corona in full sunshine. The latter, unable to obtain any coronal indications, expressed doubts of the genuineness of those produced by Mr. Huggins. No discussion of the merits of the case can be at-

tempted here; but it may be said that, since the publication of the report of the observers of the eclipse of Aug. 29, 1886, Mr. Huggins himself has grave doubts regarding their reality. If they are real, then during a partial eclipse his plates ought to show the corona partly cut off by the advancing and receding moon. Upon photographs taken at the Cape of Good Hope during the partial phase of the eclipse of Aug. 28, 29, 1886, this cutting off of the corona is not shown. After receiving this announcement, Mr. Huggins, in a published letter, says: "I wish to be the first to make known this untoward result. I greatly regret that a method which seemed to promise so much new knowledge of the corona, would seem to have failed." Mr. Commons, a distinguished celestial photographer, does not share in Mr. Huggins's adverse and perhaps prematurely expressed opinion.

Photometry.—This comparatively new branch of astronomical research was inaugurated in this country by Prof. E. C. Pickering, of Harvard College Observatory, who has prosecuted it with marked success. He uses an instrument of his own invention, called a "meridian photometer." Briefly, it consists of a horizontal telescope having two similar object-glasses of four centimetres aperture, with a right-angle prism in front of each. The north star, which is used as the comparison star for all others, is reflected through one prism, and the star under investigation through the other. By motion given to the prism, the images of the stars are brought close together in the same field of view, for easy comparison and accurate results. In front of the eye-piece is a Nicol prism and a small graduated circle. When the former is rotated from the point where one image disappears, the light of that image will be proportional to the square of the sine of the angle, which may be measured very exactly by an index attached to the graduated circle. The magnitude of the work accomplished by this instrument was not appreciated by astronomers until the publication of Part I of vol. xiv of the annals of that observatory, containing the results of the director's photometric examinations of all naked-eye stars to 30° of south declination, amounting in number to 4,260, representing 94,476 separate comparisons, and involving an amount of labor that none but a participant can estimate. Because of the elegance of its methods and completeness of its work, the inventor was induced to construct a larger photometer with which to observe stars down to the tenth magnitude, and even some of the asteroids, to determine whether they, as some have thought, are variable in brightness. Several astronomers in Europe, notably Rev. Charles Pritchard, D. D., Savilian Professor at Oxford, have done successful work in the same line, though the instrument used, called a wedge photometer, differs from that of American invention. Though not quite equal in accuracy to that of

Harvard, Dr. Pritchard claims for it exactness to the one tenth of a magnitude.

The Biela Star-Shower.—That there is a star-shower, in this age, occurring on the morning of Nov. 14, and that it is associated with a long-period comet (Tempel's) are truths somewhat universally recognized; but that there is also another November shower, sometimes of great brilliancy, which occurs on the evening of the 27th of that month, and is also connected with a comet (Biela's), is not so extensively known. Because of the great shower, observed over more than half of the globe, of Nov. 27, 1872, and also that of 1885, it is appropriate that a brief history of the comet, its rupture, its final loss, and the periodical star-shower resulting from the disintegration, be given. It was first discovered on March 8, 1772, by Montaigne, who did not suspect its periodicity. It was not again seen until Nov. 10, 1805, when it was rediscovered by Pons. Elliptic elements were calculated by Bessel, though it was not associated with any previous comet. On Feb. 27, 1826, Biela discovered a comet for which calculation indicated an elliptic orbit of short period, and, furthermore, that it was identical with the comet of the years 1772 and 1805, and would be again due in 1832, which prediction was verified to the letter, the comet returning to perihelion within twelve hours of its computed time. At its next return it was not found; but in 1846, being well situated for observation, it was early detected and watched with great interest. A few weeks after the discovery, the strangest phenomenon in the annals of cometary astronomy—viz., its disruption into two comets—was witnessed. The cometary pair traveled through space side by side, the distance between them increasing until, on Feb. 9, 1846, a maximum distance of 227,000 miles was reached, which, at its next return in 1852, had grown to 1,250,000 miles. Since then it has not been observed, nor will it probably ever again be seen. Whether the disintegration has been complete, is unknown. Thus the matter rested, and was partly forgotten, until Nov. 27, 1872, when the world, and especially the Eastern Continent, was startled by a star-shower equal to any ever seen in Europe (though far inferior to the great shower observed on this continent on the morning of Nov. 13, 1833). It was soon ascertained that the rain of meteors was caused by the passing of the earth through the *débris* of Biela's comet. In England they fell at the rate of 10,000 an hour, as seen from any one station. The radiant was in Andromeda. On Nov. 27, 1885, the Biela meteoric shower repeated itself; and, as in the case of its predecessor, the Eastern was the favored continent, though the display in this country was sufficient to attract general attention. At the Glasgow Observatory the number of meteors visible during one hour and fifty minutes was estimated at over 23,000. Throughout Europe and Asia it was an exact counterpart of the shower of 1872. The pas-

sage of the earth through the swarm of meteoroids (so called by Prof. Newton), or disintegrated particles of Biela's comet, left behind in its former path around the sun, is the generally conceded cause of this shower. The earth annually passes, on Nov. 27, near the orbit of the comet, and, were the meteoroid particles evenly distributed along its path, as are those of the August 10th shower, there would be an annual Biela shower on that date, but they are so unequally scattered that a great shower can occur only once in thirteen years. The next in order will probably be on Nov. 27, 1898.

Three days before the great Biela shower of Nov. 27, 1872, the writer observed (and it was also seen in many other places) a fine meteoric display of short continuance, whose radiant was in Cassiopeia. Some think it was a shower from the other component of Biela.

The New Star in the Andromeda Nebula.—The sudden appearance of this new star, its gradual decrease in brightness, and final extinction, are fresh in the minds of astronomers. It is not known who first or last saw it; but its disappearance from even the largest telescopes took place in the early spring of 1886. It afforded, while visible, a fruitful theme for discussion and speculation. It will probably never be known whether it was connected with the nebula in whose center it appeared, or merely in alignment with it. It is one of the many curious and inexplicable phenomena that occasionally appear in the heavens, the cause of which astronomers are powerless to explain. It may be a periodical temporary star, and in all coming time its place will be watched for its re-appearance. Though the heavens afford many examples of periodic variable stars, they offer no known precedent of a periodic temporary star.

New Star in Orion.—On the evening of Dec. 13, 1885, Mr. Gore, of Ireland, noticed a sixth-magnitude, reddish star, near the star Chi' (= 54) Orionis, which was not on the charts of Harding, Lalande, Weiss, Birmingham, or the *Durchmusterung*. As he suspected it to be either a new variable or a new star, the discovery was immediately telegraphed to Harvard, where Prof. Pickering at once made photometric examination of it, and promptly replied that it was of the sixth magnitude. By March 1, 1886, it had decreased, according to Pritchard's photometer, to 7·14 magnitude. In April it was rated by several observers at ninth magnitude, and later as low as the twelfth, but now (Dec. 1, 1886) it is as bright as when first discovered, and is specially remarkable as, instead of decreasing to a minimum and there remaining (as did the new star in the Northern Crown, or disappearing entirely, like the new one in Andromeda), it has done neither. Observations continued to near the end of 1886 have convinced astronomers that the star is an ordinary variable, with a period not far from a year. Its light appears to fluctuate from about the fifth magnitude at its maximum to

the twelfth at minimum. It is therefore not a temporary star, as at first supposed, because of its absence from all star-charts. Its spectrum is peculiar; and though astronomers are not agreed as to its precise nature, yet all admit that it belongs to Secchi's third type, of which α Orionis, α Hercules, α Ceti, and β Pegasi are the brightest examples. Its position for January, 1885, was, by meridional observation, R. A. 5^h 47^m 13^s, Dec. + 20° 8' 42". It seems to be a clean-cut star, without haziness, disk, or apparent motion.

Proper Motion of Stars.—The proper motion of the stars, whether in the line of sight or at right-angles to it, is to the astronomer a fascinating subject. Before the distance of any of the stars had been measured, it was the received opinion that the brighter stars were the nearer to our system, and, had they any apparent motion, that it would be largest in these; but both assumptions are erroneous, for, as far as is now known, not a single bright star has a proper motion at right-angles to the line of sight, equal to that of some of the fainter ones. The following list includes a few of the stars whose proper motions are best known. No. 1 has long stood at the head as having the largest proper motion of any known star. The actual velocity in miles depends, of course, upon its distance from us:

NAME OF STAR.	Annual proper motion.	Parallax.
Groombridge, 1830.....	7·05"	0·09"
Lacaille, 9852.....	6·96	0·285
Gould's Sculptor 1584 in hour xxiii.....	6·21
61 Cygni.....	5·23	0·468
Lalande, 21185.....	4·75	0·50
Epsilon Indi.....	4·63	0·22
Lalande, 21238.....	4·40	0·27
5 ^o Eridani.....	4·10	0·166

It will be readily seen that there is but little correspondence between motion and parallax. The absolute motion of No. 1, whose apparent motion is so great with a parallax so small, is altogether incomprehensible. About 5·5° south preceding of 70 Ophiuchi is a star of about the thirteenth magnitude, which has the largest proper motion of any star of that degree of faintness known. Its parallax (and of course its distance) is unknown.

Satellite Orbits.—In Appendix I to vol. xxviii of the "Washington Observations," Prof. Asaph Hall discusses the observations of Oberon and Titania, the two outer satellites of Uranus, made by himself, with the 26-inch refractor of the Naval Observatory, during the years 1875-'76 and 1881-'84. From these he makes the mass of Uranus = $\frac{2}{3} \frac{1}{3} \frac{1}{3}$, that of the sun being equal to 1. Appendix II, of the same volume, contains a similar discussion of his observations of the satellite of Neptune. He finds the mass of that planet to be $\frac{1}{3} \frac{1}{3} \frac{1}{3}$; or, in other words, it would take 19,092 Neptunes to equal the sun's mass. He deduces the value of the mass of Saturn to be $\frac{1}{3} \frac{1}{3} \frac{1}{3}$.

Spectra of the Planets.—The spectra of all the planets, from Mercury to Saturn, are very similar, the differences being, as a rule, too slight for a basis for any opinion as to their physical constitution or the precise nature of their atmospheres. But the latest researches of Huggins and Vogel have shown that the spectrum of Uranus is quite unlike that of the others, and approaches more nearly to that of Neptune. It contains six broad bands, one of them being coincident with $H\beta$, but the identity of the others is doubtful. These observations have shown the erroneousness of Secchi's map of the spectrum of Uranus. Neptune shows eight absorption bands.

Red-Sky Glows.—This beautiful and mysterious phenomenon, that so suddenly manifested itself in the autumn of 1883, still continues. During the months of October and November, 1886, it on several occasions almost equaled the gorgeous displays of 1883-'84. It has, however, differed from those in the non-appearance of the second and third glows, and the partial absence of the counter-glow, which for a long time were three of its distinguishing characteristics. The writer refers to its renewal as seen from western New York. One accompanying feature during its early appearance was the "noon-glow," or "Bishop's ring," which was generally considered to have a connection with the sunset and sunrise phenomena; but this is now doubted by many, for the reason that, for the past eighteen months, nota vestige of it has been observed. This, however, does not, any more than does the absence of the second and third glows, and of the counter-glow (the glow opposite the sun), prove their disunion. Various hypotheses having been advanced to account for these unwanted solar appearances, and as there was no agreement between astronomers and meteorologists regarding them, H. H. Warner, of Rochester, N. Y., offered a prize of \$200 for the best three-thousand word essay on the subject, which was the means of calling out a large number of able papers from all over the world. These essays were submitted to three judges—two astronomers and one meteorologist—who awarded the prize to Prof. K. I. Kiessling, of Hamburg, Germany. Two hundred and fifty dollars and seven gold medals were also given to other contestants. Prof. Kiessling was able to produce in his laboratory all the observed phenomena except the counter-glow. The processes used are described in his papers, which will be found entire, with three of the others that drew cash prizes, in vol. i of the "Publications of the Warner Observatory." Nearly all of the essayists advanced the theory of atmospheric dust as the primary cause, the volcanic eruption of Krakatoa being, by the majority, esteemed the source of this abnormal amount of matter in the atmosphere. The principal objections to this theory are the inadequate quantity of erupted material, and the long persistence of its atmospheric retention. The first is plausible,

but the latter is groundless, as the atmosphere is never free from dust, which is the cause of the ordinary warm and mellow sunsets, of which phenomena of the red glows of the past three years are but an intensification. There is no alternative but to ascribe this dust to volcanic origin; for, had the earth encountered a nebulous body, fully half its circumference must, in a few minutes, have been engulfed. That the dust is long retained, is an argument in its favor. If its source were Krakatoa, then it must have been ejected with a velocity far surpassing that of a rifle-bullet, and thrown to a height of 50 or 75 miles, far above winds and clouds, where perfect quiescence reigns eternal. Just how dust reddens light is not quite clear; but if, as Prof. Kiessling has proved, there can be no condensation of moisture in an atmosphere absolutely free of dust, it follows that the fine dust-particle may gather to itself moisture that perhaps plays an important part in the programme. This experimenter succeeded in reddening light only when the dust-particles are of exactly the same size. Apropos to the assertion that dust, under certain conditions, will redden light, and that without the incasement of each particle in a film of moisture (for we can not suppose that there can be moisture at the height the dust is supposed to reach), M. Janssen, of Meudon, France, has succeeded in condensing carbonic-acid gas to the density of water, and at each compression a cloud of dust was formed which, when a ray of light was passed through it, became of a blood-red color.

Canals of Mars.—The "Bulletin Astronomique" of the Paris Observatory, for July, 1886, contains an interesting article by M. Perrotin on the observation of Martial canals discovered by Schiaparelli with the 8½-inch refractor at Milan Observatory, Italy, during the close approach, in 1877, of Mars to the earth. By the aid of the Henry equatorial of 15-inch aperture, he was able not only to confirm Schiaparelli's discoveries, which astronomers were loath to believe, but also to recognize the canals, even those that the Italian astronomer had declared were double. At the latter time, however, the planet subtended an angle of only 14''. He also observed great temporary changes, and even obscurations of some of the numerous markings which were due, no doubt, to the movements of clouds. M. Perrotin's observations were also confirmed by Mr. Denning, of England, and by observers at Nice.

Jupiter's White and Red Spots.—The great red spot, which for eight years has attracted attention from astronomers, still continues to be faintly visible, and, though its size and shape remain about the same, its brick-red color has greatly faded. From its first discovery until now, its contour has been an oval, whose major axis was 30,000 miles in length, and its minor, 8,300. It undoubtedly appeared somewhat suddenly in 1878, while the planet was lost in the sun's rays, as, when first seen, it was of a magnitude not subsequently much, if

at all, exceeded. It is situated at about 30° south latitude, and has a proper motion of its own, which renders abortive any attempt to compute with desired exactness, the period of Jupiter's rotation. According to the determinations of Prof. Hough, the spot has completed its diurnal rotations, as follows: 1879, in $9^{\text{h}}\ 55^{\text{m}}\ 34\cdot9^{\text{s}}$; 1881, in $9^{\text{h}}\ 55^{\text{m}}\ 37\cdot2^{\text{s}}$; 1883, in $9^{\text{h}}\ 55^{\text{m}}\ 38\cdot4^{\text{s}}$; 1884, in $9^{\text{h}}\ 55^{\text{m}}\ 38\cdot5^{\text{s}}$; 1885, in $9^{\text{h}}\ 55^{\text{m}}\ 40\cdot1^{\text{s}}$. Prof. Young, in 1885, observed in 50° south latitude, or 20° nearer the pole than the great red spot, a white spot, whose rotation period was only $9^{\text{h}}\ 55^{\text{m}}\ 11\cdot14^{\text{s}}$. In the "Sidereal Messenger" for December, 1886, he says: "It is noteworthy that, although this spot was in a higher latitude than the red spot, it yet rotates more rapidly." This is the reverse of all former experiences, and adds still another to the many inexplicable phenomena observed on the giant planet. The tinted spot being of the same color as the belts, would betoken identity of origin, but the white spots must be produced by a different cause. They are generally very small in appearance, and sometimes many are seen simultaneously, quite often in a line like a string of white beads. No satisfactory reason for their formation has been assigned, as also must be said of the colored spots and belts. The large white spot or cloud that manifested itself on the great red spot, covering all but a narrow annular portion around its border, and rendering it almost invisible even through large telescopes, has disappeared, and the spot in its original entirety may now be observed, but, though as bright as in 1884, yet it may easily be overlooked.

Lunar Heat.—For the past two hundred years, astronomers and physicists have endeavored to answer the question, "Does the earth receive any heat from the moon?" Prof. Forbes, in 1888, concentrated moonlight six thousand times, without obtaining any indication of heat, and he hazarded the opinion that it did not amount to $\frac{1}{300,000}$ of a degree centigrade. On the other hand, Prof. Langley, with the sensitive bolometer, concentrating upon it the moon's rays by the 13-inch refractor of the Allegheny Observatory has succeeded in deflecting the galvanometer scale 42 divisions. His final conclusions—the result of the investigations of several years—are thus told by himself: "While we have found abundant evidence of heat from the moon, every method we have tried for determining the character of this heat appears to us inconclusive; and, without questioning that the moon radiates heat earthward from its soil, we have not yet found any experimental means of discriminating with such certainty between this and reflected heat that it is not open to misinterpretation. Whether we do so or not in the future, will probably depend on our ability to measure by some process which will inform us directly of the wavelengths of the heat observed." He inclines to the opinion that the moon is surrounded with a gaseous envelope of extreme tenuity.

Invisible Heat Spectra.—Prof. Langley, in a valuable paper read before the National Academy, gave the results of his investigations of invisible spectra, which he has shown to contain energy heretofore unobserved, because glass is opaque to them, though they will pass through prisms made of rock-salt. Unfortunately, these prisms are difficult to make, and endure but short usage. John A. Brashear, of Allegheny, Pa., after many trials, has succeeded in producing prisms of this material of great perfection, by the use of which Prof. Langley has determined that, at least, the one-hundredth part of the energy of the entire solar spectrum comes from the ultra-violet rays. Up to 1882 all that was certain was wave-lengths of $0\cdot0010$ millimetre; within two years he went down to $0\cdot00027$ millimetre, and there he found that the sun's effect ceased. Afterward, by the use of a large Rowland grating, he made readings down to $0\cdot1$ millimetre, when there was only one vibration in 40 seconds. The shortest sound-wave is 5 millimetres, and only fifty times longer than the longest wave-length of the spectrum according to Langley's determination, which almost bridges the immense gulf between light and heat on the one hand, and sound on the other.

Dark Transits of Jupiter's Satellites.—One of the most inexplicable phenomena observed in the solar system is the occasional transit of two of Jupiter's satellites as dark objects. During their transits, their sunny sides are of course presented to us, and should be seen as brightly illuminated as the face of the planet. The third and fourth satellites often make dark transits, and occasionally the first is seen as a brown object, but the second has never been noticed otherwise than as a bright disk. Several such transits of the fourth satellite, and a very few of the third, have been observed during the current year.

Variable Stars.—In the whole range of physical astronomy there is nothing more mysterious than that a star, which is really a sun like our own, should vary in brightness, and that periodically, as the majority of them do. Upward of 200 of this class of stars are now known, several hundred others are suspected, and every year new ones are observed. As it is a subject well adapted to amateurs (no instrument save an opera-glass being required), a large number of variables will, in the near future, no doubt be added to the list. Ordinarily the light variation is small, while in exceptional cases, from being a bright star at its maximum, it fades away until it becomes invisible even in a powerful telescope. If the list of variable stars be examined, it will appear that there are but very few with periods between seventy-one and one hundred and thirty-five days. It will also show the connection between the periods and the colors of the stars, those of short period being, for the most part, white, and those of long period red or orange-red. The most complete and valuable catalogues of vari-

ables and suspects (the latter published since the issue of last year's "Annual Cyclopaedia") are the work of Mr. J. E. Gore, of Ireland. The suspected variables, 745 in number, are arranged in the order of right ascension, and are accompanied by particular descriptions. He classifies them into five divisions, as follows: Class 1. Temporary stars. Class 2. Stars undergoing larger variations during several months. Class 3. Irregular variables undergoing but slight changes of brightness. Class 4. Variables of short period like β Lyra, δ Cyphæi, etc. Class 5. Stars of the Algol type undergoing periodical changes lasting but a few hours. Some of these he divides into sub-classes. The variable star V Cygni, discovered by Birmingham, has recently been added to the list, and proves to be remarkable, as the following light variation will show: May 13, 1882, = 8 magnitude. Oct. 19, 1882, = $9\frac{1}{2}$ magnitude. May 5, 1883, = $12\frac{1}{2}$ magnitude. May 27, 1883, = 12 magnitude. July 26, 1883, = $8\frac{1}{2}$ magnitude. Sept. 19, 1885, = $11\frac{1}{2}$ magnitude. Sept. 29, 1885, = 11 magnitude. Oct. 26, 1885, = $10\frac{1}{2}$ magnitude. Its color is red, and it is situated $2^{\circ} 51' 42''$ north of α Cygni.

Discovery of Nebulae.—After the discovery of the immense number of nebulae by Sir William Herschel, and later by his son, Sir John Herschel, the subject received little attention until taken up by D'Arrest, Schultz, Lassell, Rosse, and others. Since then, until revived by Messrs. Stephan and Swift, it had fallen into neglect. Their conjoint discoveries amount to over one thousand. It seems useless to speculate upon the origin and design of such immense volumes of matter in comparison with which the space circumscribed by Neptune's orbit is puny. The list of M. Stephan, of Marseilles, France, has been given to the public through various channels, such as the "Astronomische Nachrichten" and the "Monthly Notices of the Royal Astronomical Society of England." A partial list—all he had discovered up to 1873—is to be found in Dreyer's "Supplement to Sir John Herschel's Catalogue of Nebulae." Those discovered by Dr. Swift, at the Warner Observatory, Rochester, N. Y., have been published in five catalogues (one in 1885, and the succeeding four in 1886), of one hundred each, in the "Astronomische Nachrichten." Their positions are approximately given, accompanied by descriptive remarks. But two of the whole number may be seen with a $4\frac{1}{2}$ inch telescope. Most of them are as faint as the faintest of Herschel's Class III, and some are still fainter. These discoveries contradict the heretofore expressed opinion that a quest for new nebulae must result only in time lost. Swift's list affords but few with striking characteristics, as might be expected of objects so excessively faint and difficult to see. Only a few require special mention. One is in Monoceros, R. A. $6^{\text{h}} 24^{\text{m}} 11^{\text{s}}$, Dec. $+5^{\circ} 7' 32''$, close to the cluster HVII, "General Catalogue," 1424. This peculiar object was picked

up many years ago with a $4\frac{1}{2}$ -inch refractor. It is, except the great nebula in Orion, the largest one visible from this latitude, and for a while was thought to be a glow from the above-named cluster. The annexed list comprises all the nebulous stars proper of the five catalogues:

R. A.	Dec.		
h.	m.	s.	"
5 1 5 —	8 20 45	A	bright star in center of circular atmosphere.
6 26 36 +	10 23 15	A	bright star in center of circular atmosphere.
18 9 28 — 19 55	1	A	bright double star in center of circular atmosphere.
18 9 30 — 19 50	1	A	bright double star in center of circular atmosphere.
21 30 45 + 12 15 54		A	bright star in center of circular atmosphere.

The size of these atmospheres is at least ten times that of Neptune's orbit, and probably much greater. The exact centralization of the stars makes it very improbable that their positions are accidental. Two hundred and seventy-three new nebulae have been recently discovered at the Leander McCormick Observatory, University of Virginia, by Prof. Ormond Stone. For a year or two past the six-foot reflector of the Earl of Rosse has been used in the study of photometry and lunar heat instead of in nebular work.

Variability of Nebulae.—A very few nebulae have been suspected of variability, but, in almost every instance, the supposed change has been traced to errors of observation, impurity of the atmosphere, or other causes. There are, however, two cases (both in Taurus) where the evidences of variableness appear to be beyond controversy. The first is the very small nebula about 11° from ϵ Tauri discovered in 1852 by Dr. Hind. It was about 1' in diameter, with a central condensation of light. On Oct. 3, 1861, D'Arrest found that the nebula had totally disappeared—a statement so improbable as to be discredited. It was, in January, 1862, unsuccessfully sought for both by Leverrier at Paris and by Secchi at Rome, though by the following March it had so far increased in brightness as to be easily seen. Another instance has recently come to light of a nebula near ζ Tauri (not Messier I) undergoing changes. It was observed by Chacornac at Paris, near the close of 1885, surrounding a star of the eleventh magnitude, which he and others had repeatedly observed in 1854, and which had also been observed at Markree in 1850, without any apparent nebulosity. In 1856 Chacornac found the nebula very bright, but in 1862 every trace of it had disappeared, nor has it since been seen until recently (in March, 1885), when it was rediscovered by Mr. Tarrant with a 10-inch reflector and verified by Chacornac.

Astronomical Prizes.—Since the "Annual Cyclopaedia" for 1885 went to press, the Lalande prize of 540 francs has been awarded to M. Thollon, for his map of the solar spectrum.

The Valz prize was given to Herr Spörer for his thirty years' work on the physical constitution of the sun. The Rumford medal for 1886 has been awarded to Prof. S. P. Langley, for his researches on the solar spectrum. The Council of the Royal Astronomical Society of England have conferred the society's gold medal upon Profs. Pickering and Pritchard, for their photometric researches. In this country the National Academy of Sciences are in future to award three astronomical prizes for original research. One, founded by the late Prof. James C. Watson, is to be awarded biennially; another, established by the widow of the lamented Dr. Draper, who was a distinguished member of the Academy, is to be bestowed annually for best original research in astronomical physics; and the third was instituted by the late Prof. Lawrence Smith, for original research in meteoric astronomy. The session held on April 20, 1886, was especially distinguished by the conferring of the first medal ever awarded by the Academy, the Draper gold medal of the value of \$200, to Prof. S. P. Langley, for his investigations of the wave-lengths of light in the infrared and ultra-violet portions of the spectrum. The Watson medal has been conferred upon Dr. B. A. Gould, though its actual bestowal will not take place until 1887. The Smith prize has not yet been awarded. The Warner astronomical prizes for discoveries of comets were first offered in 1882, and have since been annually renewed, the last offer dating March 1, 1886, and running to March 1, 1887. The prize as first tendered was \$200 in gold for the discovery of a new comet, but was restricted to the United States and Canada. It is now \$100, but is open to the world. Since the tabulated list of recipients of this prize in the last volume of the "Annual Cyclopaedia," the following have been awarded: To Prof. E. E. Barnard, Nashville, Tenn., \$200; to Mr. W. R. Brooks, Phelps, N. Y., \$200, \$100, \$100, and \$100; to Prof. E. E. Barnard, Nashville, Tenn., \$100; to Mr. W. H. Finlay, Cape of Good Hope, Africa, \$100. Including remunerations to the judges of the astronomical essays, the total amount paid by Mr. Warner is \$4,200, and he has conferred, upon competitors for the "Red-Sunset" prizes, seven gold medals of beautiful design and workmanship, each of \$60 value, and a "Warner prize for scientific discovery," a gold medal also, to Edward D. T., the fourteen-year-old son of Dr. Swift, of Rochester, N. Y., for the discovery of sixteen new nebulae. The astronomical prizes of the French Academy for 1886 were as follows: Lalande prize gold medal, or 450 francs, for most important astronomical discovery; Damoiseau, 10,000 francs for the best work on the theory of Jupiter's satellites, discussing the observations and deducing the constants contained in it, especially that which furnishes a direct determination of the velocity of light; Valz, 460 francs, for the most interesting as-

tronometrical observation made during the year. For the second of these prizes, the Damoiseau, no memoir was presented in 1885, hence the renewal of the offer.

Observatories in the United States.—Within the memory of many not yet old, there was not in the United States a single telescope suitable for making the most common astronomical observation; but now, with commendable pride in the large instruments and observatories, public and private, which are scattered about our country, we may challenge the admiration of the world. The following are a few of the largest refractors of the United States:

Observatory.	Object-glass.	Location.
Lick.....	36 in.	Mt. Hamilton, Cal.
Naval.....	26 in.	Washington, D. C.
Leander McCormick.....	26 in.	University of Virginia, Va.
Halestead.....	23 in.	Princeton, N. J.
Dearborn.....	15½ in.	Chicago, Ill.
Warner.....	16 in.	Rochester, N. Y.
Van Duzee.....	a dialyte	Alexander (formerly at Buffalo), N. Y.
	16 in.	
Washburn.....	15½ in.	Madison, Wis.
Harvard.....	15 in.	Cambridge, Mass.
Litchfield.....	15½ in.	Clinton, N. Y.
Dudley.....	18 in.	Albany, N. Y.

There are, besides, probably one hundred telescopes (both refractors and reflectors) over eight inches in diameter, many of them the property of private individuals, engaged in celestial researches.

The Lick Telescope and Observatory.—The scientific world is much elated over the near completion of this giant telescope, with object-glass a yard in diameter, and of the great tower in which it is to be placed. The completed lenses, mounted temporarily at Cambridgeport, Mass., have already been subjected to several trial tests, in the presence of experts, who unhesitatingly pronounce the disks perfect and the definition satisfactory. Messrs. Warner & Swasey, of Cleveland, Ohio, specialists in this kind of work and distinguished for great ingenuity and mechanical skill, are to have the mounting completed in April, 1887, at a contract price of \$42,000. The following data, received from the gentlemen composing the firm, will therefore be interesting as being authoritative: The telescope is to rest on a cast-iron, rectangular column, whose dimensions at the base are: North and south, 17 feet; east and west, 10 feet; at the top, 4×8 feet. The height of the column from the base is 28 feet, and its weight about 12 tons. On the top of this column rests the head-casting, weighing 3 tons, which contains the bearings of the polar axis. The polar and declination axes of steel are 10 feet long. Their bearings are 10 inches and 12 inches and 9 inches and 10 inches, respectively. Bored through the entire length of each axis is a hole 5 inches in diameter, which not only serves to lighten it but answers other purposes as well. The clamps for slow motion, with slow-motion shaft for R. A., are placed inside the polar axis,

whose outside is so burdened that it is a great advantage to be able to utilize the cavity. Through the hole in the declination-axis, the observer is enabled to read the R. A. circle from the eye-end of the instrument. The diameter of the fine-reading circles is three feet. Coarse-reading circles are also provided. Inside and near the top of the column is the driving-clock, which causes the telescope to follow in R. A. the object under observation, by a tangent-wheel five feet in diameter (instead of a sector), which makes the motion continuous. Surrounding the top of the column, and reached by a spiral stairway from its south side, is a balcony, from which an assistant has access to the driving-clock and may control the telescope in all its motions. Here, too, from a certain position, he can read the circles, both coarse and fine. The driving-clock is of the same construction as those used by Messrs. Warner & Swasey on all of their telescopes. It has a double, conical pendulum, isochronously mounted, and the pendulum-balls are at liberty to take their theoretical positions. The observer from the eye-end of the telescope governs all clamps and slow motions by handles within easy reach, and reads both circles without rising from his seat. No observing-chair, commonly so called, will be used, but the entire floor will be raised or lowered by hydraulic machinery, so that, at whatever altitude observations are being made, the observer sits comfortably in his easy-chair, with a table at his side on which lie his observation-book, etc., while the eye-piece is always at a convenient height. The focal length of the telescope is 56 feet 2 inches; and the tube of sheet-steel, 42 inches in diameter, is suspended from its center, the point of suspension or center of motion being 36 feet from the floor. The cost of the object-glass was \$51,000; cost of the dome, \$56,850; cost of mounting, \$42,000; photographic lens when obtained, \$13,000; total, \$162,850. When completed, it, together with the unexpended balance of the \$700,000 of the original fund, will be turned over by the trustees, of whom Capt. Richard S. Floyd is president, to the regents of the University of California, as the astronomical department of that institution, over which Prof. Edward S. Holden, already at the head of the university, will preside. Under the provisions of the trust, the observers are to receive no salaries until the observatory is completed. As the greater dome could not be built until the focal length of the large objective had been ascertained, the delay of several years in securing the two rough disks from Fiel and Sons, of Paris (costing \$7,000 each), was greatly deplored. They, now polished, and, in their cells weighing 750 pounds, constitute the visual objective. This instrument is not designed for (and, in fact, is worthless for) celestial photography, though the attachment to it of a third lens of the proper curves called a photographic lens corrects it for the actinic rays, but renders it useless for the visual. By attaching and de-

taching this third lens, both purposes are served. The disk received for this lens, condemned by the Clarks as under a strain from imperfect annealing, and liable to break in the working, was, fortunately for the opticians, at the risk of M. Fiel, who ordered the work to proceed. As predicted, the lens, during the process of grinding, broke into three pieces, entailing heavy loss. The photographic lens must, by consequence, be delayed for an indefinite time, greatly to the regret of the director, who desired early to bring the great telescope into photographic work. The Lick Observatory is on the summit of the lowest of the three peaks of Mount Hamilton, of the Coast Range of California, 4,285 feet above the level of the sea, 50 miles south of San Francisco, and, in an air-line, about 40 miles from the Pacific Ocean. The site was chosen by the gentleman whose name it bears, and whose tomb, as well as monument, it is to be, James Lick, who died in 1876. The advantages of this situation can not be overestimated. Prof. Holden assures us that, for six or seven months of the year, every night is clear, while of the remainder, half the nights are good for observation. The instruments now mounted are a 12½-inch and a 6-inch equatorial, a comet-seeker, a 4-inch transit, a 6-inch meridian circle, a Repsold vertical circle, a photo-heliograph, and a heliostat. In addition, there are five clocks, mean time and sidereal, and several chronometers. A carriage-road, very circuitous but of easy grade, twenty miles long, has been constructed at great expense by the county of Santa Clara to the observatory, which obviates the difficulty of ascent and affords a charming drive.

Floating Dome.—The new observatory at Nice, France, has a dome possessing at least one novel and apparently valuable feature. The bottom of the dome is provided with a circular float, which revolves in a narrow annular tank filled with a solution of chloride of magnesium in water. It is a little heavier than water, and will not freeze until a temperature of 40° centigrade below zero is reached. Running wheels are also used, but the pressure on them is slight, and it may be entirely removed by the addition of more water to the tank. Guide-wheels prevent the dome from swaying laterally. The practical working of the great dome of steel, seventy-two feet in diameter and weighing 95 tons, is quite satisfactory. The telescope, a refractor of thirty inches aperture, has now been in use for several months. The object-glass was made by the Henry Brothers of Paris.

Star-Catalogues.—A valuable acquisition to our stock of star-catalogues has just been issued, known as the "Second Armagh Catalogue." It comprises 3,300 stars, mostly Bailey's, reduced to the epoch of 1875. The observations were made by the late Dr. Robinson, and prepared for publication by his successor, Dr. J. L. E. Dreyer. The first four hours of the "Edinburgh Catalogue," constituting vol.

xiv, was published in 1877; but the remaining twenty hours (vol. xv) has, from want of funds, remained unpublished until this year. This latter is a large, heavy volume, and appears to be a useful work. A glance at the two ponderous volumes (xiv and xv) shows the vastness of the labor bestowed upon them. An ephemeris of each of the 3,890 stars, from 1830 to 1890, is given, with critical remarks. "The Annals of Harvard College Observatory," vol. xv, Part I, published during the current year, contains a catalogue of 1,213 stars. The Pulkova Observatory has just issued a catalogue of 3,542 stars observed with the meridian circle during the years 1840 to 1849. It includes all the Bradley stars between the pole and fifteen degrees south declination. Though it has appeared late, it will no doubt be much appreciated by the working astronomer. The Argentine catalogue, giving the mean positions of 32,448 southern stars determined at the Cordoba Observatory, has recently been published by Dr. B. A. Gould.

New Time-Reckoning.—The new reckoning of the astronomical day, recommended by the Washington Conference, will be used at once in the printed results of the meteorological and spectroscopic departments at the Greenwich Observatory; but they advise a postponement of its use, in publishing the astronomical results, and in the Nautical Almanac departments, until 1891, when probably it will have been adopted by most scientific countries.

AUSTRALASIA. British Australasia comprises the colonies in Australia of New South Wales, Victoria, South Australia, and Queensland, all self-governing, Tasmania, and New Zealand, likewise possessing parliamentary institutions, and Western Australia and Fiji, with the islands of Rotumah, which are crown colonies, besides the British possessions in New Guinea. Their combined area is 3,267,750 square miles, their aggregate population 3,697,069.

Australasian Federation.—The British Parliament in 1885 passed a Federal Council Act of Australasia, establishing a Federal Council for the purpose of dealing with such matters of common Australasian interest, in respect to which united action is desirable, as can be dealt with without unduly interfering with the management of the internal affairs of the several colonies by their respective legislatures. A session of the Council shall be held at least once every two years. The colonies possessed of responsible government shall be represented in the Council by two, and the crown colonies by one member each. The Council is given legislative authority in respect to (1) the relations of Australasia with the islands of the Pacific; (2) prevention of the influx of criminals; (3) fisheries beyond territorial limits; (4) the service of civil process outside the jurisdiction of the colony in which it is issued; (5) the enforcement of judgments by courts of law beyond the limits of the colony; (6) the enforcement of criminal process in all the

colonies, and the extradition of offenders, including those who have abandoned their families, and deserters from the military and naval forces of the colonies, or from the imperial forces; (7) the custody of offenders on board ships outside of territorial limits; (8) any matter which the legislatures may refer to the Council; (9) general defenses, quarantine, patents, copyrights, bills of exchange, and promissory notes, uniformity of weights and measures, recognition of marriage or divorce, naturalization, status of joint-stock companies, or any matter with respect to which the legislatures of the several colonies can legislate within their own limits, except that in such matters the acts of the Council shall have force only in such of the colonies as have applied to it for a common law and shall ratify the same acts with respect to the first three categories must receive the approval of the Imperial Government. The governors of any two or more colonies may refer to the Council, on an address from the legislatures, any questions relating to those colonies or their relations with one another. The approval or disapproval by the Imperial Government of any act of the Federal Council shall be signified by the Governor of the colony in which the Council is sitting.

The colonies of Victoria, Queensland, Tasmania, Western Australia, and Fiji only had taken advantage of the act when the Federal Council, representing those colonies, met in Hobart on Jan. 25, 1886. The colonies of New South Wales and New Zealand had taken no steps to join the union, while in South Australia the necessary measure had been delayed in its passage through the Legislature.

The Australian Federal Council.—The Federal Council, which met in Hobart, recommended the fortification of Torres Strait and King George's Sound by combined imperial and colonial action. It passed measures authorizing the service of civil process outside the jurisdiction of the colony issuing it, and providing for the enforcement of judgments of the Supreme Court within the Confederation. It also passed an address to the Queen in relation to the convention with France in regard to the South Sea. After appointing a standing committee to transact business during the recess, the Council adjourned on Feb. 6.

Naval Defenses.—Rear-Admiral Tryon, the British commander-in-chief on the Australian station, presented to a conference of the Premiers of Victoria, New South Wales, and Queensland, held at Sydney in April, 1886, a scheme for a common naval force, in addition to the existing local forces. He proposed that five cruisers of the "Archer" class and some fast sea-going torpedo-boats should be provided, at a cost of £625,000, by the colonies; that the British Admiralty should man them, but that the cost of maintenance, estimated at £150,000 a year, should be borne by the colonies. The colonial governments were willing to un-

dertake the cost of maintenance, and those of Queensland and New South Wales offered to pay interest and depreciation, but they concurred in the opinion that the original cost of building and equipping the new vessels should be borne by the Imperial Government.

The French Occupation of the New Hebrides.—Negotiations respecting the annexation of the New Hebrides Islands to France were carried on between the British and French Governments in March. The French Cabinet offered a pledge that no recidivists should be sent to the islands. The Australian governments protested against allowing France to acquire possession of the New Hebrides. New South Wales declined to join in the protest, on the understanding that France would agree to send no more recidivists to the Pacific islands.

In the early part of May two French vessels were sent from Noumea to land troops on the New Hebrides. The British Government, at the request of the Victorian authorities, ordered two cruisers to those waters. The grounds given for French action were that the natives had massacred French citizens. Troops were landed from the transport "Dives" at Havannah harbor, in the island of Sandwich, and the French flag was hoisted on June 1. Another military station was established at Port Sandwich, on the island of Mallicolo.

The French Government, when interrogated by the British minister in Paris, explained on June 10 that a French company had sent Frenchmen to work in the New Hebrides, and that in March several had been murdered by the inhabitants. The rest called on the company to protect them or to take them away. On the application of the company, the Governor of New Caledonia sent troops to establish temporary posts where French citizens were in danger, and that they would be withdrawn when the emergency had passed, as the French Government had no intention of violating the agreement made with England in 1878 by proceeding to a political occupation of the islands. Orders were sent from France that if the French flag had been raised it should be taken down. The report of the acting British consul in the New Hebrides that the French flag had been raised caused much excitement in Australia and England. The commander of the British ship "Undine" investigated the matter, and reported that there was no formal occupation nor proclamation of a French protectorate.

The concessions that the French Government offered for the cession of the New Hebrides were that no more French criminals were to be deported to the Pacific, and that England should be allowed to annex Rapa. The French minister urged that the New Hebrides belonged to the same geographical group as New Caledonia, that his countrymen had considerable and increasing interests on the islands, and that they needed both as an outlet for emigration and a field for enterprise and as a source from

which to obtain laborers for New Caledonia if the colonization of relapsed criminals on that island were to cease. The Australians, though they have but few settlers and no considerable plantations in the New Hebrides, whereas the French have acquired and cultivated land on the islands, possess the largest share of the trade. The strongest objections to the cession were raised on behalf of the Australian Protestant missionaries, who have stations on fifteen islands, have expended \$800,000 on building churches and maintaining missionaries, and made 8,000 converts. They fear that under French rule Protestant missions would be discouraged through the influence of the Roman Catholic clergy.

On July 25 Lord Roseberry informed M. Waddington that, in view of the almost unanimous objections of the Australian governments, the British Government were unable to accept the conciliatory and amicable arrangement for a French protectorate, or to depart from the agreement by which Great Britain and France bound themselves to respect the independence of the New Hebrides. Meetings were held in Australian cities, and dispatches were sent by the colonial authorities to Downing Street, during the summer and autumn, protesting against the continued occupation of the islands by French troops.

The Germans in the South Sea.—About the middle of February, 1886, the German cruiser "Albatross" visited Bismarck Archipelago and inflicted punishment on the natives of New Ireland, who had murdered two white traders named Carr and Campbell. The Germans pursued the murderers into the interior, destroyed some houses and plantations, and stormed a fortified village. They then sailed to New Britain to collect fines imposed on the natives. A detachment went inland to seize a recalcitrant chief, but did not venture to attack him. Another detachment was set upon by natives, but drove them away with their swift and deadly fire. The town of Kerberkader was bombarded. On the 9th and 10th of March the "Albatross" bombarded some villages on New Ireland. In the various encounters eight of the Germans were wounded and twenty-six natives killed. In June the "Albatross" visited Mallicolo, one of the New Hebrides Islands, and punished the natives for murdering a German and destroying his property.

Annexation of the Kermadec Islands.—The Kermadec group, lying between New Zealand and the Friendly Islands, were annexed by the British corvette "Diamond" on Aug. 1.

The Colonial Exhibition.—In the Indian and Colonial Exhibition, held in London in 1886, the Australian colonies had large and complete displays showing their productions and their progress in the arts, and sent pictures and collections of natural objects to present to the eye the appearance and nature of the country. From Victoria there were manufactures in great variety, besides wool, wine, and other

natural products. South Australia sent fruits, cereals and fodder-plants, wine, and wool. From New South Wales there were examples of pastoral products, including mohair from a new breed of goats, and products of the fisheries and the mineral and other industries of the colony. Queensland exhibited gold, silver, copper, and lead ores, tin, wool, amber, and pearl-shell, quartz-mining machinery in operation, sugar, and coffee. Western Australia was represented by sandal-wood and a variety of fine timbers. New Zealand had an extensive display of wool, grain, minerals, manufactured products, woods, and building materials, and very complete collections exhibiting the scenery, geological features, and natural history of the country, and the life and industries of the aborigines, as well as of the colonists. Before the exhibition closed the Prince of Wales, under whose auspices it had been organized, suggested that a permanent Colonial Institute should be established in London. The Australian colonies offered to contribute jointly £30,000 a year for this object.

The End of the Drought.—After four years of drought that has inflicted severe losses on the Australian stock-growers, and caused stagnation in every branch of trade, the rain began to fall in quantity in July, and the mildness of the winter allowed the grass to spring up everywhere in abundance. New South Wales, Victoria, South Australia, and Queensland each received refreshing rains, which were sufficient to stop the starvation in the flocks and herds.

New South Wales, the oldest of the Australasian colonies, has a Constitution, which vests the legislative power in a Parliament of two houses, the first of which is called the Legislative Council, and consists of not fewer than twenty-one members nominated by the Crown. The second, called the Legislative Assembly, consists of 119 members elected by seventy-two constituencies. The members of either body must be of age, and naturalized subjects of the Queen. The electors have no property qualification, and the votes are taken by secret ballot. The execution is in the hands of the Governor, who is nominated by the Crown. The present Governor is Lord Carrington, who assumed office Dec. 12, 1885. He is advised in the exercise of the executive by a Cabinet of nine ministers who were appointed Feb. 26, 1886, as follows: Premier and Treasurer, Sir P. A. Jennings; Colonial Secretary, G. R. Dibbs; Attorney-General, John Henry Want; Secretary for Lands, Henry Copeland; Secretary for Public Works, W. J. Lyne; Minister of Justice, J. P. Garvan; Minister of Public Instruction, A. Renwick, M. D.; Secretary for Mines, James Fletcher; Postmaster-General, F. B. Sutton.

The colonial naval defense is a voluntary body consisting of 640 officers and men. The military establishment comprises a permanent force of 513 officers and men, 5,185 partially

paid volunteers, and 3,012 on the reserve force; making a total of 8,197. The maintenance of this force cost £188,693 in 1884.

Education is under control of the state, and in 1884 the Department of Instruction expended £797,763, which was a decrease of £72,808 from the expenditure of 1883. The total attendance in the schools of all classes was 202,519 pupils, with 4,860 teachers.

The estimated population in 1884 was 921,263. In 1884 there were 72,486 immigrants and 40,254 emigrants, showing a net gain of 32,232 immigrants. The births in 1884 were 33,946, and deaths 14,220, showing an excess of births over deaths of 19,726; number of marriages, 7,482. The estimated population of Sydney, the capital, in 1885, was 260,000.

The principal source of public revenue was formerly derived from the sale and rent of public lands, which produced more than one half the total annual receipts, but in 1884 these sales were partially stopped on account of a new land act which went into force Jan. 1, 1885. The next most important source of revenue was from customs duties, which yielded one fourth the total annual receipts. The only direct tax is the stamp-tax. The revenue for 1885 was estimated at £8,695,929, and expenditures at £8,420,575. The public debt, which was chiefly incurred for railways, telegraphs, and other reproductive public works, amounted to £31,601,959 on Dec. 31, 1885. The expenditure on railways and telegraphs alone amounted to £22,196,330 at the end of December, 1884.

The total value of imports in 1884 was £22,826,985; of exports, £18,251,506. The staple article of export is wool, of which there were 120,221,143 pounds shipped to the United Kingdom in 1884, valued at £8,403,530. The next most important articles of export to Great Britain are tin, of the value in 1884 of £757,213; copper, of the value of £410,182; tallow, of the value of £380,542; preserved meat, of the value of £165,739.

The total area of the colony is about 207,000,000 acres. Of this, in 1884, there were 141,158,400 acres leased for pastoral purposes; 35,085,504 acres devoted to agricultural purposes; under wheat, 275,250 acres, yielding 4,208,394 bushels in 1883; under maize, 115,560 acres, yielding 2,989,555 bushels; under sugar-cane, 6,997 acres, yielding 21,835,072 pounds of sugar. The vine is cultivated, and in 1885, 441,612 gallons of wine were made.

In March, 1885, New South Wales had 30,379,871 sheep; 1,336,329 horned cattle; 330,603 horses; and 211,656 pigs.

In 1884 the quantity of coal mined was 2,749,109 tons, valued at £1,303,077. There were produced in the colony 105,983 ounces of gold, valued at £390,229. The copper and tin mines are also very valuable, the former producing 7,233 tons of copper in 1884, valued at £363,854; of tin, 5,256 tons were produced, valued at £207,827.

In 1884 there were 1,643 miles of railway in operation, and 2,085 miles under construction. The whole of the lines open were built by the Government, at an expenditure of £21,526,-900. The expenses in 1884 were £1,301,259, while the gross earnings were £2,086,237.

There were, in 1884, 18,681 miles of telegraph-wires, which cost £612,450 to construct. There were 2,334,052 paid messages transmitted in 1884. The post-office of the colony transmitted 42,237,000 letters, and 25,-063,500 newspapers in 1884.

Legislation.—To meet the deficit caused by the falling off of the land revenue, the ministry proposed to levy duties of 5 per cent. ad valorem on all imports, both those paying specific duties and those on the free list, to tax unimproved land exceeding £1,000 in value about $\frac{1}{5}$ per cent., to levy a tax of $3\frac{1}{2}$ per cent. on incomes exceeding £300, and to impose new stamp duties. By various retrenchments the estimates of expenditure were reduced by £500,000, and with the new taxes, expected to yield £1,000,000, the deficit could be removed in two years. To carry out this policy, the ministry resigned on Feb. 18, was reconstructed, dissolved Parliament, and obtained the sanction of the country. The land-tax bill was rejected by the Assembly. That and the income-tax bill were announced by Sir Patrick Jennings as measures that would be again submitted to Parliament in the following session. He said that the deficit at the end of the year would amount to £2,000,000, and that the country had not been in so depressed a state for twenty-two years. The customs duties were passed after a long and animated contest. They were supported by the young and growing Protectionist party in the colony. The Cabinet was reconstructed in view of the popular sentiment in favor of protection, though the Premier has not openly avowed a protective policy. The Opposition leader, Sir Henry Parkes, is the principal champion of free trade, and takes issue with the ministry chiefly on this question.

Victoria.—The Governor, Sir Henry Brougham Loch was appointed April 10, 1884. The Cabinet was composed in the beginning of 1886 as follows: Premier and Treasurer, Duncan Gillies; Chief Secretary, Alfred Deakin; Attorney-General, H. J. Wrixon; Minister of Mines and Agriculture, John James; Commissioner of Public Works and Water Supply, J. Nimmo; Minister of Justice, Henry Cuthbert; Commissioner of Trade and Customs, W. F. Walker; Minister of Public Instruction, Charles H. Pearson; Minister of Defense, James Lorimer; Postmaster-General, F. T. Derham. In August, Duncan Gillies assumed, in addition to his other duties the direction of the Ministry of Mines, replacing John Dow, who had succeeded Mr. James. The land forces in 1884 comprised 3,003 men of all arms.

There is no state church in Victoria. At the last census, 78 per cent. of the population

were Protestants; 24 per cent. Catholics; and half of one per cent. Jews. In 1883-'84 the total cost of public instruction was £642,197. In the same year there were 1,777 state schools, with a total enrollment of 222,428 scholars, instructed by 3,621 teachers. There were in 1885, 655 private schools in Victoria, with 1,634 teachers and attended by 85,115 scholars. At the census of 1881, 92 $\frac{1}{2}$ per cent. of the total population over fifteen years of age were able to read and write.

There are five main sources from which the revenue of Victoria is derived, viz., taxation, land, public works, posts and telegraphs, and railways. In 1883-'84 the total amount raised by taxation was £2,318,520. The total revenue of the colony for the year 1885 was £6,-290,652, while the expenditure for the same year was £6,212,517. The public debt at the end of June, 1885, amounted to £31,757,407, the greater part of which was borrowed for the construction of railways, state school-buildings, and other public works. The revenue for 1885 amounted to £6,250,000, an increase, as compared with the preceding year, of £60,-000. The railroad revenue showed an increase of £73,000.

The colony has an area of 87,884 square miles, of which about 22,000,000 acres are either alienated or in process of alienation. Of the remainder only about 9,000,000 acres are at present suitable for agriculture; mountain forests occupy 12,000,000 acres; land covered with smaller scrub, 11,500,000 acres; state forests, 650,000 acres; timber and other reserves, over 900,000 acres; auriferous land, nearly 1,500,000 acres; and roads, over 1,000,-000 acres. In March, 1885, there were 2,323,-493 acres of land in cultivation in the colony. Of this area 1,096,354 acres were under wheat. The produce of wheat was 10,438,146 bushels, or 9 $\frac{1}{2}$ bushels to the acre, while oats produced nearly 23 $\frac{1}{2}$ bushels to the acre, barley over 17 $\frac{1}{2}$ bushels, potatoes over four tons, and hay over one ton to the acre.

The last census was taken in 1881, when the total population was 862,346, comprising 452,-083 males and 410,263 females. On June 30, 1885, the estimated total population was 973,-403. The total number of Chinese in 1881 was 12,128, and of aborigines 780. In 1884 there were 7,218 marriages, 28,850 births, and 13,-505 deaths. During the same year the total immigration into the colony by sea was 72,202, while the total emigration by sea was 58,061. The population of the principal towns of Victoria was as follows in 1881: Melbourne, 282,-947 (in 1885, 325,000); Ballarat, 41,087; Sandhurst, 38,420.

The total value of the exports of Victoria for the year 1884 was £16,050,465. The staple articles of export were: Wool, to the amount of 119,502,240 pounds, valued at £6,342,877; gold and bullion, of the value of £1,010,295; grain and flour, of the value of £1,762,007. Among the minor articles of export from the

colony are leather and skins, tallow, and preserved and salted provisions.

There were obtained, in Victoria, in 1884, 778,618 ounces of gold, valued at £3,114,472. The total quantity of gold raised from 1851 to 1854 is estimated at 52,992,768 ounces, valued at £211,971,072. The estimated number of miners at work in the gold-fields at the end of 1884 was 28,430, of whom 5,359 were Chinese. The yield of gold in 1885 was 784,000 ounces.

There were 4,020 miles of telegraph lines, comprising 8,055 miles of wire, open at the end of 1884. The revenue from telegraphs was £89,077 in 1884; the number of messages sent, 1,594,296.

The railways in Victoria all belong to the state. At the end of June, 1884, there were 1,624 miles of railway completed, and 71 miles in progress. By the railway construction act of 1884, 62 new lines, of an aggregate length of 1,201 miles, were authorized. The total cost of the whole of the lines, exclusive of the stores and materials on hand at the end of 1884, was over £22,000,000. On this the net profit was 3·98 per cent. The gross receipts in the year 1884 amounted to £2,196,150, the expenditure to £1,335,800, or 60·82 per cent., and the profits to £860,350.

The post-office of the colony forwarded 33,403,884 letters, 5,767,781 packets, and 15,143,067 newspapers in the year 1884. The postal revenue, including the receipts from telegraphs, was £356,817 in 1884.

Legislation.—The closing period of the session of 1885 was marked by an angry assault of the opposition on the Government, attended with all-night debates and unparliamentary recriminations. A reciprocity treaty between Tasmania and Victoria, permitting the free interchange of products of the two colonies containing not more than 5 per cent. of foreign material, is the first substantial step toward intercolonial federation. A factories and shops bill was enacted, requiring shops to close every evening at seven o'clock, except on Saturday. On Feb. 16 the coalition under Duncan Gillies resigned, and Mr. Gillies was charged with the formation of a new ministry. Parliament was dissolved on Feb. 20, and new elections were appointed for March 5. They resulted in the return of 54 Ministerialists, 18 of the Opposition party, and 14 Independents. The most important measure of the session of 1886 was the irrigation bill, passed Sept. 30. It authorizes the Government to borrow £4,000,000 for the construction of works to supply at least 3,242,000 acres of land with water. The proceeds of the loan are to be lent to local trusts, which will construct the works, and have power to levy rates to pay the interest. The rates required are estimated at about eleven shillings per acre of the land supplied. Irrigation-works are expected to be extended over Australia, if found successful in Victoria, and to prevent such droughts as that in which 12,000,000 sheep perished in the single colony of New

South Wales in one year, and thus double or treble the productive capacity of the island-continent. The Assembly placed a duty on woollen goods of 20 per cent.

South Australia.—The ministry, reconstructed on June 7, 1886, is composed as follows: Chief Secretary, J. B. Spence; Colonial Treasurer, John Cox Bray; Commissioner of Public Works, L. L. Furner; Commissioner of Crown Lands, J. H. Howe; Minister of Education, J. A. Cockburn; Attorney-General, John W. Downes. The Governor is Sir William C. F. Robinson, who was appointed November, 1882. The revenue of the colony for 1885 was £2,157,981, derived from customs duties, posts and telegraphs, railways, and territorial receipts. The expenditures for the same year were £2,430,513, the main portion of which is on account of the public works, railways, and interest on the public debt. The estimated revenue for 1886 is £2,344,124, and expenditures £2,407,584. During 1885-'86 an addition of £270,000 is expected from a new tax on land and income, being two years' receipts. Later estimates showed a large deficit, in consequence of which the Government proposed to reduce salaries, but abandoned the intention when the revenue prospects improved. A deficiency of £809,000 was expected. The public debt of the colony, dating from 1852, amounted, on July 1, 1885, to £17,084,200.

The area of the colony is 903,425 square miles. The total population on Dec. 31, 1884, was estimated at 312,781—164,877 males and 147,904 females. During 1884, there were registered 11,847 births, 4,789 deaths, and 2,555 marriages. There were 17,290 immigrants and 16,082 emigrants.

The total value of the exports to various countries, exclusive of bullion and specie, amounted in 1884 to £6,623,704. The imports were valued at £5,749,353. The chief articles of export are: Wool, the exports of which in 1884 amounted to £2,618,626; wheat and flour, £2,491,896; copper and copper-ore, £375,325.

Of the total area, 578,272,000 acres, 10,670,572 acres were alienated at the end of 1884. The total land inclosed amounts to 53,444,411 acres, of which 2,785,490 acres were under cultivation in 1884-'85; of this, 1,942,453 acres were under wheat. The gross produce of wheat in 1884-'85 was 14,621,755 bushels. In 1884, 473,535 gallons of wine were produced, of which 50,080 gallons were exported. The live-stock in 1885 numbered 168,420 horses, 389,720 cattle, and 6,696,406 sheep. In 1884 there were 1,785 pastoral leases, holding 144,723,200 acres.

The colony had 1,060 miles of railway open for traffic, and 262 miles of lines in course of construction, in December, 1884. In the same year the colony had 5,291 miles of telegraph lines in operation, with 9,067 miles of wire. There is also a line running from Adelaide to Port Darwin, across the center of the continent, a distance of 2,000 miles, in connection

with the British Australian cable, forming telegraphic communication with all parts of the world. This line was constructed at the expense of the South Australian Government. In 1834 there were 555 post-offices in the colony; and during 1883 there passed through them 12,679,142 letters and packets, and 6,890,810 newspapers.

Tasmania.—The ministry of Tasmania is composed as follows: Premier and Chief Secretary, Adye Douglas; Treasurer, W. H. Burgess; Attorney-General, J. S. Dodds; Minister of Lands and Works, N. J. Brown. Sir G. C. Strahan was appointed Governor, Dec. 1, 1881.

The area of the colony is estimated at 16,778,000 acres. The estimated population on Dec. 31, 1884, was 130,541. During 1884 there were 4,578 births, 1,990 deaths, and 1,003 marriages. The immigrants in 1884 numbered 14,257; emigrants, 12,524.

The total revenue in 1884 was £549,262; expenditure, £584,047; estimated revenue for 1886, £582,825; expenditure, £586,756.

The total exports in 1884 were valued at £1,475,857, made up of the following items: Wool, £453,567; gold, £132,010; tin, £301,423; timber and bark, £137,586; hops, £35,975; fruits, green and preserved, £170,985. The value of the imports was £1,656,118. Of the total area of the colony, 4,403,888 acres have been sold or granted to settlers, while 1,778,977 acres have been leased as sheep-runs. In 1885 there were 425,845 acres under cultivation. The principal crops are wheat, oats, and barley; hops are also largely grown, and great quantities of fruit, much of which is preserved and exported.

At the end of 1884 there were 215 miles of railway open for traffic, and 159 miles in course of construction. In the same year there was 1,313 miles of telegraph lines in operation.

Queensland.—The Governor, Sir Anthony Musgrave, was appointed in April, 1883. The Executive Council of seven ministers is composed as follows: Premier and Vice-President of the Executive Council, Samuel Walker Griffith; Colonial Treasurer, James Robert Dickson; Postmaster-General, Thomas Macdonald-Paterson; Attorney-General, Arthur Rutledge; Secretary for Public Works, William Miles; Secretary for Public Instruction and Colonial Secretary, Berkeley B. Moreton; Secretary for Public Lands, Charles B. Dutton.

The law making education compulsory is a dead letter. In 1884 there were 558 schools of all grades, employing 1,552 teachers, and having an average attendance of 46,588 scholars. Education cost the Government £1,395,082 in 1884. At the census of 1881, 29·44 per cent. of the population could not read or write.

The public income of the colony in 1884-'85 was £2,720,656, derived chiefly from the following sources: Customs, £937,225; land-rent, £258,909; other rents and sale of lands, £328,422; from railways, £664,535; posts and telegraphs, £169,195. The public expenditure was

£2,819,854, the chief items of which were: Interest on the public debt, £732,185; public instruction, £187,257; administration of public lands, £282,755; cost of working railways, £408,236; posts and telegraphs department, £282,755. The total expenditure on public works was £1,565,028. The estimated revenue for 1885-'86 is £2,982,500; the estimated expenditure, £3,006,214. For 1886-'87 the revenue is estimated at £3,000,000, and the expenditure at £3,069,000. The public debt of the colony amounted, on July 30, 1885, to the sum of £19,070,850.

The area of Queensland is estimated at 668,497 square miles. The population in 1881 was 213,525—125,325 males and 88,200 females. On June 30, 1885, the estimated population was 318,606. In 1884 there were 36,883 immigrants and 18,263 emigrants, showing a net gain of 18,620. There were 10,679 births, 6,861 deaths, and 2,661 marriages in 1884.

The total value of exports in 1884 was £4,673,864, the chief of which were wool, valued at £1,889,504; hides and skins, £109,291; sugar, £454,995. The value of imports into the colony for the same year was £6,381,976.

In 1884, 316,113,920 acres were rented for cattle-runs, and yielded a rental of £254,874; the number of runs was 9,542. The live-stock in 1884 numbered 253,116 horses, 4,266,172 cattle, 9,308,911 sheep, and 51,796 pigs. The total area under cultivation in 1884 was 199,588 acres. The leading grain-crop is maize. The growth of sugar-cane is quite successful, 57,687 acres being under this crop in 1884. There was a sugar-crop in 1886 of over 50,000 tons. A rise in the price of wool helped greatly to revive languishing trade in Queensland, as well as in the other colonies.

The gold product of 1884 was 4,529,280 ounces, valued at £15,852,480.

At the end of 1884 there were 1,207 miles of railway open for traffic, and 746 miles more in course of construction. The railways are in the hands of the Government, and the cost of construction, up to the end of 1884, was £8,631,835. The revenue from railways during 1884 was £630,631, and the expenditure in working them £357,535.

The post-office of the colony in 1884 carried 8,929,835 letters, 7,502,759 newspapers, and 807,177 packets.

There were, at the end of 1884, 6,979 miles of telegraph lines, and 11,300 miles of wire. The number of messages sent in 1884 was 1,012,255. The receipts were £77,118, and the working expenses £85,297.

The Militia.—Under the defense act of 1885 a very complete system of territorial militia has been organized on a plan drawn up by Col. French, who formerly served in the Northwest Provinces of Canada. All the male inhabitants capable of bearing arms, excepting only sons of widows, may be called out in four classes. In the first line come unmarried men and widowers, without children, between the

ages of eighteen and thirty; in the second, the same classes of men from thirty to forty-five years of age; in the third, married men and widowers with children, between eighteen and forty-five years of age; in the fourth, all men between forty-five and sixty. In times of peace the active force is constituted by voluntary enlistment for three years, the privates receiving 6s. a day. The volunteer force more than doubled within a year from the enactment of the new law. A military school for the instruction of officers has been established at Brisbane.

Gold Discoveries.—A gold-field near the head of the Etheridge river has been worked for two years, and new discoveries are being constantly made in that region. The field has an estimated area of 9,760 square miles. Many of the reefs yield from 1 to 6 ounces, some from 10 to 16, and one from 10 to 25 ounces, to the ton of quartz. The average yield in 1885 was 2 oz. 10 dwts. The average yield of the Queensland is higher than that of any other country. The Etheridge field has not been developed to the same extent as the Charters Towers, Gympie, and Ravenswood, on account of the lack of railroad communication.

Western Australia.—The administration is vested in a Governor, assisted by an Executive Council, consisting of the Colonial Secretary, the Attorney-General, the Colonial Treasurer, the Surveyor-General, and the Director of Public Works. The present Governor is Sir Frederick Napier Broome, who was appointed in December, 1882.

The revenue for 1884 was £290,319, and the expenditure £291,306. The revenue for 1885 was estimated at £295,666, and the expenditure at £295,391. The total public debt of the colony at the end of 1885 was £765,000.

The total estimated area of the colony is 975,920 square miles. The results of the census of 1881 gave a total population of 29,708—17,062 males and 12,646 females. In 1884 there were 1,094 births and 717 deaths; 2,434 immigrants and 1,563 emigrants.

The total value of imports in 1884 was £521,167; exports, £405,693. At the end of 1884 there were 79 miles of railway open for traffic, and 48 miles under construction. There were 1,885 miles of telegraph line in the colony in 1884; there is also a line 450 miles in length in course of construction from Geraldton to Port Cossack, which will probably be united by submarine cable with the telegraph system of the world.

The Kimberley Gold-Field.—A remarkably rich gold-field has been discovered in the Kimberley district, situated in the northern part of Western Australia. The diggers who went to the new field in the spring of 1886, brought back nuggets weighing from $2\frac{1}{2}$ to $19\frac{1}{2}$ ounces. Some of them obtained as much as 30 ounces in a single day. The gold is as pure as the best products of the Ballarat or Sandhurst fields. Steamers from Sydney, Melbourne, and

VOL. XXVI.—5 A

New Zealand were engaged by July in conveying gold-diggers to the harbor nearest to the diggings, Cambridge Gulf, where a new town had sprung up. The climate is tropical, and so dry that miners must take pack-horses to bring water. The adventurers who first sought the new mines were all provided with a very expensive outfit, but all were rewarded by obtaining a satisfactory amount of metal in the few weeks that their supplies lasted. Old miners predict that the field will prove the richest, and much the most extensive, in Australia. The region is adapted to sheep-raising, but not without water conservation.

New Zealand.—The present Governor, Lieut.-Gen. Sir W. F. Drummond Jervois, was appointed in November, 1882. The list of ministers is as follows: Colonial Treasurer, Postmaster-General, Commissioner of Telegraphs, and Commissioner of Stamp Duties; Sir Julius Vogel; Premier, Attorney-General, and Minister of Education, Robert Stout; Minister of Public Works, Edward Richardson; Native Minister, Minister of Defense, and Minister of Lands, John Ballance; Minister of Justice, Joseph Augustus Tole; Colonial Secretary, Patrick A. Buckley; Minister of Mines and of Marine Department, William J. M. Larnach.

The legislative power is vested in the Legislative Council, composed of fifty-four members nominated by the Crown for life, and the House of Representatives, with ninety-five members, elected by the people for three years. Four are aborigines, elected by the natives.

The colonial troops consist of a voluntary force of 8,177 men of all ranks, besides a permanent armed constabulary force of 450 officers and men. The approaches to the principal ports of the colony are defended by batteries of heavy ordnance, supplemented by torpedo-boats and submarine mines.

In New Zealand there were, in 1884, 1,334 schools of all kinds, employing 3,188 teachers, and having an average attendance of 113,481 scholars. The amount expended on education in 1884-'85 was £416,127. Education is obligatory, and in the public primary schools free and secular.

The area of New Zealand is estimated at 66,779,092 acres. Up to the end of 1884 17,692,511 acres had been alienated. The population on June 30, 1885, was, including Maoris, 616,229. The number of marriages in 1884 was 3,800; births, 19,846; and deaths, 5,740. The net immigration in 1884 was 9,321. The population of New Zealand is increasing more rapidly than that of any other of the Australian colonies.

The chief source of the ordinary revenue is from customs, £1,411,102 in 1884-'85; receipts from railways, £1,050,742; stamps, £510,018; property-tax, £145,379; telegraphs, £95,757; and excise on beer, £55,714. The territorial revenue includes receipts from sales of crown lands, from depasturing licenses and assessments, and also from mining licenses, and the

duty on gold obtained in the colony. The total revenue in 1884-'85 was £3,730,463. The chief items of expenditure were for public debt, £1,570,988; public works, £714,845; education, £334,196; posts, £255,160; defense, £182,-586. The estimated revenue for 1885-'86 amounts to £4,110,000, and expenditures to £4,070,000, leaving a surplus of £42,000. The total amount expended on railways, construction of roads, immigration, and public works of all kinds, from 1870 to 1885, was £21,800,-334. In March, 1885, the total public debt was £33,691,022. A new loan of £1,500,000 for railroads was issued in 1886.

The total imports for 1884 were £7,663,888, 64 per cent. of which were from the United Kingdom. The exports were valued at £7,091,-667, of which 73 per cent. went to Great Britain. The leading imports in 1884 were: Iron and steel goods, £1,215,457; apparel of all kinds and materials, £1,819,678; sugar, £705,-684; wines, beer, and spirits, £386,404; tea, £180,301. The leading exports in 1884 were: Wool, 81,139,028 pounds, valued in New Zealand at £3,267,527; grain and pulse and flour, £801,271; gold, £988,953; kauri-gum, £342,-151; frozen meat, £345,090; tallow, £234,-829; timber, £152,319; sheep and rabbit skins, £151,692; live-stock, £71,174; butter and cheese, £91,667; preserved meats, £59,224.

In 1884, 852 vessels, of 529,188 tons, were entered at the ports of New Zealand, and 872, of 534,242 tons, cleared. All but 53 vessels of the former and 59 of the latter belonged to Britain and her colonies.

In 1881 the number of occupied holdings was 30,832, comprising 10,309,170 acres of freehold and 4,827,727 acres of leasehold property. The total acreage under crops in 1885 was 6,550,399, of which 664,540 were under grain; 80 per cent. of the total acreage is under grass. In 1885 the total production of wheat was 6,866,777 bushels, and of oats 12,360,449 bushels. The bulk of the gold-mining is on government land, and in 1884 the gold export amounted to 246,393 ounces, valued at 988,953. The total value of the gold exported from the colony up to March 31, 1885, was £41,634,507.

On Dec. 31, 1884, there were 1,570 miles of railway open for traffic in New Zealand. For the year ending March 31, 1885, the surplus receipts were £355,685. The total expenditure on construction of all the Government lines to March 31, 1885, had amounted to £12,721,035. When the whole of the projected systems of railways are completed, they will have cost, with their equipments, about £16,000,000. The colony had, on Jan. 1, 1885, 10,474 miles of telegraph wire in operation. The total number of telegrams dispatched in 1884 was 1,654,305, for which £80,626 were received. The post-office in 1884 transmitted 35,257,846 letters and 14,-093,742 newspapers.

The Maoris.—The Premier at the opening of

Parliament stated that the relations with the natives were never better, and that large blocks of land were being transferred to Europeans. In July a serious disturbance occurred near Hawera, when 500 Maori men and women made an incursion into lands belonging to Englishmen, and began plowing and erecting buildings. The Maoris were dispersed by the police, who arrested several chiefs, and an order was issued for the arrest of Te Whiti, the champion of native rights, as the instigator of the trouble. Te Whiti, Tito Kowaro, and other chiefs who were arrested, were detained in jail till October, and then sentenced to fines and short terms of imprisonment.

Volcanic Eruption.—An eruption of Mount Tarawera, on the east side of Tarawera Lake, in the northern part of the North Island, which occurred in the beginning of June, disturbed the surface of the country for many miles around. Whole villages were buried under the falling matter, consisting of stones, ashes, and boiling mud. The eruption was accompanied by violent earthquakes. The Tarawera volcano, which first burst into activity on the morning of June 11, subsided gradually and became entirely quiet; but several active craterers were formed on Mount Rotomahana, and the pink and white terraces near that mountain, which had been the chief beauty of that picturesque region, disappeared. The disturbances extended over sixty square miles. Hundreds of geysers, in addition to those previously existing, broke out into intermittent activity. The township of Wairoa was buried in mud, several Maori settlements were destroyed, and over 100 persons known to be killed, among them six Europeans. The scene of the disturbance was the Hot Lakes district, 40 miles inland from the Bay of Plenty on the east coast. This district has been a resort for tourists on account of its boiling fountains, terraces of glistening silica, and other natural beauties, and for invalids on account of the medicinal virtues of the hot baths. It was feared that the fine volcanic dust that covered the face of the country over a large part of the province of Auckland had ruined the pastures; but after the rain had washed the dust into the soil it was found that vegetation was quickened. Experiments established the fact that plants would germinate and grow vigorously in the pure dust.

AUSTRIA-HUNGARY, a dual monarchy in Central Europe, composed of the Federal Empire of Austria or Cisleithania and the Kingdom of Hungary or Transleithania. The two monarchies are united in the person of the sovereign, and in a common military and naval system and a common diplomacy. There is a ministry for common affairs, which are subject to legislative control and action through delegations from the legislative bodies of the two kingdoms. The delegation from each Parliament consists of 60 members, and when any members are from any cause absent from one, a like num-

ber is eliminated by lot from the other. All measures are presented for action to each delegation separately; and if their decisions diverge, they meet to vote jointly, but without discussion. Franz Josef I succeeded his uncle, Ferdinand I, as Emperor of Austria, upon the abdication of the latter, Dec. 2, 1848; and after the restoration of the Hungarian Constitution, June 8, 1867, was crowned King of Hungary. The heir-apparent is the Archduke Rudolph, born in 1858, only son of the Emperor. The Minister of Foreign Affairs and of the Imperial House for the whole Empire is Count G. Károlyi de Köröspatak, appointed Nov. 21, 1881; the Minister of War, Lieut. Field-Marshal Count Bylandt-Rheydt, appointed June 21, 1876; the Minister of Finance, Benjamin de Kallay, appointed June 4, 1882.

Area and Population.—The total area of the Austro-Hungarian monarchy is 240,942 square miles. The population in 1880 was 37,885,226. The population of Austria, with an area of 115,903 square miles, was 22,144,244, or 191 per square mile; that of Hungary, 125,039 square miles in extent, 15,642,102, or 135 per square mile. The increase in eleven years in Austria was 8·5 per cent.; in Hungary, 1·24. In the Cisleithan Kingdom there were 10,819,737 males and 11,324,507 females; in Hungary, 7,702,810 males and 7,939,192 females.

The number of births in Austria in 1884 was 878,321; of deaths, 666,523; of marriages, 179,171; surplus of births over deaths, 211,798. In 1885 there were only 860,663 births, and 175,233 marriages, while the number of deaths was 689,493. In Hungary the births in 1883 numbered 730,934; the deaths, 526,991; the marriages, 167,609; surplus of births over deaths, 203,943.

The Empire of Austria embraces within its borders no less than 17 different principalities: The Archduchy of Austria below the Enns; the Archduchy of Austria above the Enns; Duchy of Salzburg; Duchy of Styria; Duchy of Carinthia; Duchy of Carniola; city of Trieste and its domain; Margraviate of Görz and Gradisca; Margraviate of Istria; Margraviate of Tyrol; Dependency of Vorarlberg; Kingdom of Bohemia; Margraviate of Moravia; Duchy of Silesia; Kingdom of Galicia; Kingdom of Dalmatia; Duchy of Bukowina. Among all these kingdoms, duchies, margravias, and principalities, but two are inhabited exclusively by one nationality, viz., Upper Austria and Salzburg, which are peopled by Germans. The numbers speaking the various languages were in 1880 as follow: German, 8,006,176; Bohemian, Moravian, and Slovak, 5,183,596; Polish, 3,238,534; Ruthenian, 2,792,677; Slovene, 1,140,508; Servian and Croatian, 563,371, Latin, 668,653; Roumanian, 190,799; Magyar, 9,887.

In Transleithania the division was as follows: Magyar, 6,206,872; Roumanian, 2,325,838; Servian and Croatian, 2,325,747; German, 1,882,371; Bohemian, Moravian, and Slovak, 1,799,563; Ruthenian, 345,187; Wendi, 83,150;

Gypsies, 79,393; Armenian, 3,523; other native languages, 33,668; foreign languages, 56,892; infants, 499,898.

The population of the cities with over 75,000 inhabitants in Austria-Hungary was, in 1880, as follows: Vienna, including suburbs, 1,103,857; Buda-Pesth, 360,551; Prague, 162,323; Trieste, 144,844; Lemberg, 109,746; Grätz, 97,791; Brunn, 82,660.

Education.—There are eight universities in Austria, with 796 teachers and 12,952 students in 1885. The number of technical high-schools in 1883 was six, with 337 teachers and 2,578 students; there were 11 special high-schools, with 215 teachers and 2,571 students; 49 theological schools, with 245 teachers and 1,740 students; 166 gymnasia, with 8,270 teachers and 51,893 pupils; 80 Realschulen, with 1,419 teachers and 15,236 pupils; 70 normal schools, with 978 teachers and 8,792 pupils; 1,212 special institutes, public and private, with 6,075 teachers and 84,816 pupils; 15,944 public elementary schools, with 52,314 teachers and 2,557,749 pupils; and 1,127 private elementary schools, with 85,166 pupils. Of the children of school age in 1883, 84·9 per cent. were attending school. German was spoken in 6,733 of the public elementary schools; in 4,018, Czech; in 3,777, other Slav languages; in 868, Italian; in 53, Roumanian; in 3, Magyar; in 492, more than one language. In Hungary, 83·3 per cent. of the children of school age were in school in 1883. In the two Hungarian universities in 1885 there were 211 teachers and 4,181 students. There were 13 law-schools, with 798 students; 56 theological schools, with 1,946 students; 163 gymnasia, with 38,106 scholars; 33 Realschulen, with 6,081 scholars; 73 normal schools, with 4,003 scholars; and 110 special institutes, including music-schools, with 6,899 scholars. The number of elementary schools in 1882 was 15,993, the number of teachers 22,396, the number of pupils 1,304,738. There were besides 367,094 scholars in schools of a higher grade. In 7,938 of the elementary schools the language is Magyar; in 4,801, other languages; in 2,766, more than one language.

Dr. Gautsch, the new Minister of Education in Austria, has instituted reforms in the curriculum of the universities which will give the first place in the examinations to practical studies, and relegate abstract philosophy to a subordinate rank. The study of constitutional law is to be made in the legal course.

Commerce and Industry.—The Austro-Hungarian Customs Union embraces all the lands of the two monarchies except the province of Dalmatia, with its two free ports, Trieste and Fiume. The total value of imports in 1884 was 612,900,000 florins, against 624,890,339 florins in 1883; the value of exports 708,700,000 florins, against 749,920,513 florins. The exports over the German frontier in 1883 amounted to 457,410,860 florins; those by way of Trieste to 97,424,420; those over the Italian frontier to 56,160,410; over the Roumanian frontier, 48,757,-

AUSTRIA-HUNGARY.

060; through other seaports besides Trieste, 38,355,380; across the frontier of Russia, 28,318,910; of Servia, 17,229,920; of Switzerland, 5,992,790; of Turkey, 262,280; of Montenegro, 8,440 florins. The leading classes of articles exported in 1883 were as follow:

ARTICLES.	Value, in Florins.
Cereals.....	120,778,700
Textile manufactures and materials.....	111,088,700
Animals and animal produce.....	97,083,930
Wood, coal, and turf.....	77,959,020
Sugar.....	70,173,950
Hardware.....	41,776,120
Glassware and crockery.....	27,973,020
Beverages.....	26,205,640
Fruit and vegetables.....	23,879,940
Leather and leather manufactures.....	21,212,410
Wooden ware.....	17,609,620
Iron and manufactures of iron.....	11,757,990

The value of the gold and silver exported in 1883 was 4,154,080 florins.

The value of Austrian manufactured products in 1880 was estimated at \$500,000,000. The quantities and values of the principal mineral products in 1884 were as follow:

PRODUCTS.	Tons.	Florins.
Salt.....	157,843	22,236,240
Coal.....	10,253,577	40,859,486
Silver-ore.....	7,721	8,020,365
Iron-ore.....	580,561	2,617,558
Lead-ore.....	9,497	1,071,266
Other minerals.....	109,363	2,835,467
Total.....	11,118,552	72,140,082

The value of pig-iron produced in Austrian furnaces in 1884 was 23,723,730 florins; the total value of all metals produced, 31,733,183 florins. The production of pig-iron in Austria-Hungary increased by rapid stages from about 400,000 tons in 1879 to 780,000 tons in 1884, but, owing to over-supply, fell off to 760,000 tons in 1885. The iron-masters hoped in the new ten years' treaty to secure an advance of 50 per cent. in the iron duties, which would cause the already greatly reduced importations to cease altogether.

Agriculture.—The productive area in Austria proper in 1883 was 56,697,000 acres, divided as follows: Arable, 25,700,000 acres; meadow, 7,476,000; vineyards, 521,000; forests, 23,000,-000. About 60 per cent. of the population depend on agriculture. The number of land-owners paying 1,000 florins of land tax and above in a single district increased from 1,110 to 1,133 between 1880 and 1883.

Of the total cultivable area of Hungary, 52,-800,000 acres were in 1883 devoted to agriculture, grass, and pasture, 1,062,500 to vineyards, and the remainder to woods and forests. The number of properties exceeding 14,200 acres was 231; between 1,420 and 14,200 acres, 4,695; between 285 and 1,420 acres, 13,-748; between 42 and 285 acres, 118,981; between 7 and 42 acres, 2,348,610.

Railroads.—There were, on Jan. 1, 1885, in the Cisleithan monarchy, 2,177 miles of state

railroads, 929 miles of companies' lines operated by the Government, 52 miles of Government lines worked by companies, and 5,031 miles owned and worked by companies; total, 8,189 miles. In the Hungarian monarchy the state operated 4,452 miles of its own and 1,209 miles of companies' lines, and companies, 52 miles belonging to the state, and 7,888 miles of their own lines. There were 568 miles of new roads constructed during 1884 by the Austrian Government, which sets apart 12,885,000 florins in the budget of 1885-'86 for the building of additional railroads during the year. In Hungary the Government has diminished the rate of contraction for the present, in order to avoid budget deficiencies.

Telegraphs.—The length of telegraph lines in Austria in 1884 was 23,630 miles, of wires 61,310 miles; the number of messages transmitted, 6,683,056. The receipts in 1883 were 4,053,360 florins; expenditures, 3,646,400.

In Hungary there were 10,082 miles of lines, and 36,755 miles of line in 1884; number of messages, 3,487,838; receipts in 1883, 1,766,250 florins; expenditures, 1,759,850 florins.

In Bosnia and Herzegovina there were 1,730 miles in 1884; messages in 1883, 296,962.

Navigation.—The merchant marine in 1885 consisted of 62 steamers in the foreign trade, tonnage, 67,412; 76 coasting steamers, tonnage, 13,506; and 9,068 sail-vessels of all kinds, tonnage, 243,540. The fleet of the subsidized Austro-Hungarian Lloyd line of steamers, trading between Trieste and the East through the Suez Canal, comprises 84 vessels, of 69,818 tons.

There were 62,045 vessels, of 7,657,317 tons, entered, and 61,970 vessels, of 7,641,314 tons, cleared at Austro-Hungarian ports in 1883. Of the total tonnage, 87 per cent. was Austrian.

The Post-Office.—The Austrian post-office in 1883 forwarded 335,633,500 letters and post-cards, 47,986,400 circulars and patterns, 81,-302,500 newspapers, and 33,927,000 parcels. The receipts were 20,020,730 florins; expenditures, 16,473,730 florins.

The Hungarian post-office forwarded 104,-501,260 letters and post-cards, 14,182,086 circulars and patterns, 43,118,002 newspapers, and 10,576,580 parcels. Receipts, 7,908,400; expenditures, 6,051,860 florins.

The Army.—Military service is universal and obligatory. The term of service is three years with the colors, seven in the reserve, and two in the Landwehr. The empire is divided into 102 recruiting districts, each furnishing a regiment of infantry. Tyrol and Vorarlberg form a separate district, and raise the regiment of Tyrolean Jägers. The Austrian military system has been introduced in the occupied provinces, which are organized in four recruiting districts separate from the others. The Adriatic coast provinces are also separately organized, and furnish the naval recruits. The strength of the Austro-Hungarian army in 1885 was as follows:

DESCRIPTION OF TROOPS.		DESCRIPTION OF DEBT.		
		Peace footing.	War footing.	Florins.
102 regiments of infantry.....	150,992	501,228		
1 regiment of Tyrolean Jägers.....	4,007	12,339		
32 battalions of Jägers.....	12,800	39,329		
41 regiments of cavalry.....	43,747	68,919		
18 regiments of field artillery.....	21,388	64,166		
12 battalions of fortress artillery.....	7,236	18,528		
2 regiments of engineers.....	5,258	14,137		
1 regiment of pioneers.....	2,748	7,273		
1 railway and telegraph regiment.....	887	4,769		
Train.....	2,607	88,917		
Staff and special services.....	15,859	41,254		
Total.....	284,495	1,071,084		
			Total.....	8,455,010,765
Austrian Landwehr.....	3,522	132,032		
Hungarian Honvéd.....	7,540	127,234		
Gendarmerie.....	6,254	6,164		
Total.....	267,179	805,604		

The active army and the reserves are common and are under the control of the Austro-Hungarian Minister of War. The Austrian Landwehr and the Honvéd are separate organizations, controlled by the Ministers of National Defense in the two monarchies; but all orders relating to the concentration of troops must proceed from the Emperor-King.

The Government is providing the Austro-Hungarian army with the new Mannlycher repeating-rifle, with which several corps are being armed. There have 600,000 of them been ordered, to be delivered in five years, at a cost of 35 florins apiece.

The Navy.—The Austro-Hungarian navy in 1885 consisted of 10 iron-clads, 2 frigates, 5 corvettes, 6 torpedo-vessels, 14 coast-guards, 5 transports, 2 monitors, and 18 torpedo-boats. The most powerful vessel was the Tegetthoff, with 14-inch armor, six 27-ton guns, and 6,500 horse-power. Two formidable armored vessels were under construction. Of these, the Kronprinz Erzherzog Rudolf, a barbette turret-ship, is intended to have 12-inch steel-plates and a speed of 16 to 17 knots. The other will be a barbette belted ship with 9-inch armor.

Finances.—The estimated expenditure for the whole empire in 1844 was 118,306,910 florins; for 1885, 119,453,510 florins. The budget estimates for 1886 make the total revenue 119,724,748 florins, of which 25,914,132 florins come from the surplus from customs, 90,643,089 from the contributions by the two parts of the empire, and the remainder from the ministries. The expenditures are set down in the budget as follows, in florins:

EXPENDITURES.	Ordinary.	Extra- ordinary.	Total.
Ministry of Foreign Affairs.....	4,404,400	45,400	4,449,800
Army.....	98,680,121	3,272,503	101,952,924
Navy.....	9,025,840	2,168,970	11,194,810
Ministry of Finance.....	1,995,680	1,050	1,996,730
Board of Control.....	130,484	130,484
Total.....	114,236,525	5,488,223	119,724,748

The debt of the empire stood at the end of June, 1885, as follows:

	General debt :	
	Consolidated debt.....	2,656,124,597
	Floating debt.....	59,875,555
	Capitalized annuities.....	13,917,198
Austrian special debt :		
	Consolidated debt.....	549,867,252
	Floating debt.....	1,487,737
	Land-redemption loans.....	123,738,626
Total		8,455,010,765

The main burden of the general debt, contracted before 1868, falls upon Austria, the Hungarian share amounting to only about 30,000,000 florins per annum. The Austrian debt, with the share of Hungary deducted, but with the addition of 358,000,000 florins of paper money, amounts to about 3,250,000,000 florins. Hungary owes, besides the common debt, only 127,158,000 florins.

The Occupied Provinces.—The area of Bosnia and Herzegovina, with the Sanjak of Novi-Bazar, Turkish provinces placed under Austro-Hungarian administration by the Treaty of Berlin, is 24,247 square miles; the population, 1,504,091. Of the population, 492,710 are Mohammedans, showing an increase of 44,000 since 1879; 571,250 are of the Orthodox Greek faith; 265,788 Roman Catholics; 5,805 Jews, and the remainder of other faiths.

The cost of administration is estimated for 1886 at 8,453,535 florins; the cost of the army of occupation at 5,835,900 florins.

The Austrian administration has wrought many improvements in the material condition of the country. Roads have been built, and railroads in the chief lines of communication; a system of jurisprudence has been introduced, and the legal equality of the different confessions established; the productive capacity of the land has been increased; yet the Imperial Government has totally failed to win the attachment of the people. At first, the Roman Catholics in the provinces were favored, and the propagandist designs of the Austrian priesthood promoted by the officials. This error was corrected, but the Moslem begs or landlords were then taken into favor. There was no attempt to solve the agrarian question, which under Turkish rule constituted the chief difficulty. The landlords still obtained their third part of the produce, which was collected through the Government officers in a less capricious and oppressive way than formerly, but more thoroughly. The tithes due to the Government were still collected, and in addition there were new imposts and monopolies, so that the taxes were heavier than under the Turkish régime.

A railroad from Doboj to Siminhan, 67 kilometres, was opened on April 28. It is a prolongation of the line starting at Brod, on the Hungarian frontier, and will be continued to Serajevo, meeting the line which will go to the sea, the Mostar-Metkovic section of which was completed in 1885.

The Eastern Question.—The revolution in Bulgaria and the enforced abdication of Prince Alexander Battenberg provoked in Austria-Hun-

gary a strong feeling of resentment against Prince Bismarck and of distrust of the value of the Austro-German alliance. The German Chancellor through his press organs acknowledged that his action was influenced by a fear of a Franco-Russian alliance, though the admission was construed by his political opponents as a *ruse* to secure the voting of a military budget for the next septennial period. The Austrian and German diplomacy acted in concert during the crisis, but even though they restrained Russia from intervening actively in Bulgaria, and extracted from her a promise to continue to respect the independence of that principality, the events there were regarded in Austria-Hungary as a decided Russian victory, and one that affected the vital interests and security of the dual monarchy. These feelings found expression in interpellations in the Hungarian Parliament in September. In Hungary the creation of independent states in the Balkan region that will serve as a bulwark against the expansion of Russia is considered a necessity for the continued existence of the Austro-Hungarian Empire. With the Muscovite seated in Constantinople it is feared that the Slav peoples will gravitate to Russia, that the Austro-Hungarian federation of states will dissolve, and that, while German Austria will be absorbed in the German Empire, Hungary, like Roumania, will be engulfed in the Slavic flood, and her national existence eventually obliterated. The occupation of Bosnia and Herzegovina was at first unpopular in Hungary, because the acquisition of those provinces would add to the strength of the Slav element within the empire, but it was afterward accepted as a benefit, inasmuch as it was a check to the Pan-Slavic movement. The scheme of a parallel march of Austria-Hungary to Salonica, and a delimitation of Russian and Austrian spheres of interests in the Balkans, would not, in the view of Hungarian statesmen, avert the dangers that would probably rise from the Russian advance to Stamboul.

The Customs Treaty.—The customs union between the two parts of the empire, established at the time of the division in 1867, is renewable every ten years. The year 1886 was taken up with negotiations for the arrangement of duties, subsidies, etc., for the new period beginning with 1887. The Austrian and Hungarian ministers began their conferences on Jan. 5. They decided to fix the duties on grain at the same figure as in Germany, and arrived at an agreement on all points except in regard to the duties on petroleum, molasses, and woolen yarns. Negotiations were interrupted on account of a disagreement on the petroleum and sugar duties, but finally the Cabinets came to an accord. The Hungarian oil-refineries, the largest of which are situated in Fiume, down to the middle of 1885 used crude American petroleum, which was taxed 2 florins under the general tariff of 1882. Since then, Russian refined oil with an admixture of

crude has been brought in as crude oil, and the duty reduced by the Hungarian premium on refining to only 1·10 florin per 100 kilos. The two Cabinets agreed to increase the duty on Russian raw petroleum about 30 per cent., and that on American half-refined petroleum 15 per cent. The proposed new petroleum duties caused a Cabinet crisis to suddenly arise in Austria. The Austrians desired to have the abuses in the petroleum industry corrected, not only in order to prevent frauds on the revenue and to cheapen an article of necessity, but to relieve the newly developed oil-wells of Galicia from unfair competition. The borings in Galicia are 900 feet in depth, while those in the Caucasus seldom exceed 60 feet. Moreover, the Russian oil yields 80 per cent. of kerosene, and the Galician but 50 or 60 per cent. With these differences in cost and quality, the Galicians have to pay 5 florins duty when it leaves their refineries, even if the full rates of 5 florins for semi-refined and 10 florins for refined petroleum were paid by the importers. The Poles, German Liberals, Left Center, and Clerical Conservatives united against the compromise, which left the way still open to adulteration and fraud. The Minister of Finance, Dunajevski, declared it to be impossible to distinguish adulterated petroleum by chemical tests. He and Count Taaffe threatened to resign if the Government were defeated. The Czech party also determined to abandon the ministry. The Hungarians took the ground that the petroleum duties were part of a treaty in which concessions were made on both sides. The animosity excited by this question between the two parts of the empire was aggravated by incidents that occurred in Pesth at this time, the latter part of May. Some German officers, among them Gen. Janski, the commandant at the Hungarian capital, placed wreaths on the monument of Gen. Hentzi, who fell in defending Buda against the Hungarian revolutionists in 1849. For this a Hungarian mob broke Gen. Janski's windows. The offending general was recalled after the Hungarian Cabinet had threatened to resign. Street demonstrations in Pesth were put down by the police, who killed one man. The disturbances were renewed on June 9, and the military were called upon to preserve order. When large crowds collected again on the 10th the troops surrounded them, arrested over 700, and imprisoned the leaders. The excitement was revived in July when the successor of Gen. Janski, Gen. von Edelsheim, who had made himself acceptable to the Magyars, was placed on the pension list, and Gen. Janski was at the same time promoted to the command of a division. The patriotic susceptibilities of the Magyars were appeased by a letter from the Emperor-King to Premier Tisza. The amendment of Dr. Suss, a German Liberal, who proposed that crude petroleum should be taxed nearly as high as refined, which the majority of the Chamber, following the Polish Club, had adopted in the several caucuses, was

abandoned at the last moment by the Poles, who by the fall of the ministry would lose their dominant position. An amendment, proceeding from the Poles, was voted instead, which necessitated the reopening of negotiations between the Austrian and Hungarian Cabinets. In Austria the mode of collecting the sugar duty gave the opportunity for analogous frauds. The tax was paid on the raw sugar as it entered the refinery. The manufacturers, by adulteration or other means, persuaded the excise officers that their raw sugar contained a smaller percentage of sugar than was the case, and managed to get the export bounty on as much as they paid the tax on, and to escape paying excise duty on all that they sold in the home market. This evil was corrected by imposing the duty on the manufactured product, at 10 florins per 100 kilos. A tax of 1 florin 50 kreuzers was placed on liquid sugar.

The customs tariffs agreed on are of a highly protective character. On fine cotton yarn and some other articles that are materials that can be greatly enhanced in value by further processes the duties are reduced or taken off; on ordinary woolen yarns they are doubled. On cotton prints they are raised from 60 and 70 to 100 and 120 florins per 100 kilos; on certain linen goods, from 40 to 80 florins; on fine iron-wares, from 15 to 25 and 50 florins; on optical instruments, from 125 to 200 florins; on pianos, from 10 to 40 florins; on silk or part silk clothing, from 200 to 500 florins; on the finest metal wares, from 30 to 50 florins. On linen yarns the increase is 50 per cent.; on coarse cotton goods, 10 per cent.; on fine cotton goods, 20 per cent.; on woolen goods, 25 per cent.; on silks and figured linen goods, over 10 per cent.; on iron, from 20 to 30 per cent.; and on iron manufactures and machinery, 80 and 100 per cent.

These high and in some cases prohibitive duties affect chiefly German trade, as the British, French, and Belgian imports of manufactures had already been greatly reduced since the tariff of 1882.

In return for the protection of Austrian manufactures, the Hungarians obtained high duties on agricultural products. The duty on Indian corn is raised from 25 to 50 kreuzers per 100 kilos; on barley and oats, from 25 to 75 kreuzers; on rye, from 25 kreuzers to 1 florin 50 kreuzers; on wheat, from 50 kreuzers to 1 florin 50 kreuzers; on flour and bread, from 1 florin 50 kreuzers to 3 florins 75 kreuzers per 100 kilos. The cattle duties are raised from 10 to 15 florins per head on oxen; from 2 to 3 florins on heifers; and from 1 florin to 1 florin 50 kreuzers on calves.

The ten years' treaty contains provisions for abolishing the free ports of Trieste and Fiume at the end of 1889. It also renews the charter of the Austro-Hungarian Bank on the condition that two fifths of its notes in circulation must be covered by a metallic reserve.

The rejection of the petroleum duties by the

Austrian Reichsrath necessitated the renewal of conferences between the two Cabinets. The Hungarian ministers proposed modifications in the customs tariffs, which the Austrian ministry would not accept. Experts were called in to decide whether admixtures in petroleum could be detected by chemical examination, and while those on the Austrian side testified in the affirmative, the Hungarian chemists denied that there existed any practicable means for detecting the artificial compounds. The conference in Vienna ended in the beginning of October, without result.

The Roumanian Treaty of Commerce.—The commercial treaty with Roumania expired on June 1, 1886. The treaty was of benefit to Austria only, and brought Roumanian grain and cattle into competition with similar Hungarian products. The Hungarian authorities had therefore sought to defeat its provisions by prohibiting the importation even of salted and preserved meats, ostensibly on the ground of cattle-disease. The Roumanian Government by way of retaliation ordered, from March 21, the chemical analysis of articles of consumption at the frontier, especially of flour and spirits. The Hungarians objected to the renewal of the treaty unless this vexatious order were revoked. The negotiations failed because the Hungarian land-owners were unwilling to again encounter Roumanian competition. Under the old treaty there was a brisk exchange of Austrian manufactures for Roumanian cattle and grain, until the Hungarians, in 1882, under pretense of typhus, shut out Roumanian cattle. The result was, that in Roumania thousands of oxen died for lack of fodder, and the impoverished owners bought no more Austrian goods, while in Austrian cities during the severe winter of 1885-'86 the cost of meat rose to an unprecedented price. The lapse of the Roumanian treaty disappointed the people of Austria in a scarcely less degree than the Roumanians, and was the beginning of the state of exasperation at Hungarian arrogance that rose to a greater height on the failure of negotiations for a new ten years' treaty between the two monarchies, and found vent in national recriminations over the Janski affair. The Austrians of all nationalities resent the dominant position that Hungary often assumes in imperial affairs, though she contributes but 30 per cent. toward the common expenses of the dual monarchy. The Hungarians on their part consider dualism a failure, since the subordination of the German to the Slav element under the Taaffe régime, and after the Janski incident, which they interpreted as an insult and a menace to their constitution the opposition in the Hungarian Parliament made a vigorous appeal for a separation of the military forces of the two monarchies and the creation of a national army, sworn to support the Constitution.

Austria.—The Cisleithan monarchy has a central legislature, called the Reichsrath, and

seventeen Provincial Diets. The Reichsrath consists of an upper house, formed of 18 princes of the blood, 64 nobles, 17 archbishops and prince-bishops, and 104 life-members, and of a house of deputies, composed of 353 members, of whom 85 represent the landed proprietors, 116 the towns, 21 the chambers of trade and commerce, and 131 the rural districts.

The ministry is composed of the following members: Premier and Minister of the Interior, Count Eduard Taaffe; Minister of Public Instruction and Ecclesiastical Affairs, Dr. Paul Gautsch; Minister of Finance, Dr. J. Dunajewski; Minister of Agriculture, Count Julius Falkenhahn; Minister of Commerce and National Economy, Marquis de Becquehem; Minister of National Defense, Major-General Count S. von Welsersheim; Minister of Justice, A. Prazak; without a portfolio, F. Ziemiałkowski.

Finances.—The revenue of Austria for 1885-'86 is estimated in the budget at 504,961,495 florins; the expenditure at 520,198,772 florins. In 1876-'77 the revenue was 436,724,000, and the expenditure 432,910,000 florins. According to the financial estimates for 1885-'86, direct taxes yield 96,945,000 florins, of which 33,650,000 florins come from the land-tax, 27,804,000 from the house-tax, 24,530,000 from the income-tax, and 10,100,000 from the industrial tax. The yield of indirect taxes is estimated at 306,071,952 florins, excise duties producing 90,494,000 florins; customs, 46,815,452; the tobacco duties, 72,742,000; judicial fees, 34,000,000, the salt-tax, 20,274,500; the state lottery, 20,224,000; stamps, 17,600,000; and other taxes, 3,922,000. The receipts from the postal and telegraph service are estimated at 26,577,160 florins; those from the railways at 38,343,510 florins; the receipts from mines at 6,311,735 florins; from forests and domains, 3,947,350 florins; from the ministry of Worship and Education, 5,167,062; and smaller sums from other sources, besides 10,961,797 florins of extraordinary revenue. The expenditures under the principal heads are shown in the following table:

BRANCHES OF EXPENDITURE.	Florins.
Public debt.....	117,959,057
Ministry of Finance.....	102,229,476
Contribution.....	85,048,489
Ministry of Commerce.....	67,887,279
Ministry of Justice.....	19,820,600
Pensions and grants.....	17,208,240
Ministry of the Interior.....	16,208,218
Ministry of Agriculture.....	11,406,386
Ministry of Education.....	11,197,107
Ministry of Defense.....	9,479,612
Imperial Household.....	4,650,000
Ministry of Worship.....	4,315,340
Other ordinary expenditures.....	8,368,638
 Total ordinary expenditures.....	 470,768,417
Extraordinary expenditures.....	49,430,555
 Total expenditures.....	 520,198,772

At the beginning of the session of the Reichsrath, which met on Sept. 29, the Marquis de Becquehem announced a deficit during the last few years of 5,368,000 florins in the budget of the state railroads, and asked for a credit to

that amount. The budget estimates for 1887 calculate on a total revenue of 505,676,119 florins, with expenditures amounting to 521,975,654 florins, leaving a deficit of 16,299,535 florins, as compared with 8,791,930 florins in 1866. Part of the deficit is accounted for by the anticipated expense of 7,900,000 florins for railroads, while the repeating-rifles for the infantry account for 2,401,000 florins more.

Change in the Cabinet.—Baron Pino, the Minister of Commerce, was accused of jobbery in connection with the purchase of the Prague-Dux Railroad when the bill for the purchase was brought before the Reichsrath in February. The accused minister challenged his assailants to bring charges in a court of justice; but, finding his place in the ministry untenable, sought a way to vacate it on other grounds. Without consulting his colleagues he issued an extraordinary order curtailing the Emperor's prerogative in the appointment of savings-banks directors by limiting the selection to post-office employés. The ministers decided in a Cabinet council, on March 14, that he must recall the decree, and he thereupon offered his resignation on March 14, 1886, which was promptly accepted. Baron Pusswald was appointed Minister of Commerce *ad interim*. On June 27 the appointment of the Marquis de Becquehem to the post was gazetted. Like Dr. Gautsch, who was appointed Minister of Education on Nov. 6, 1885, the new Minister of Commerce is not a party man, and not dependent on the support of any constituency, while both are supposed to sympathize rather with the policy of the Liberals than with that of the reactionary Clerical Conservatives and Czech Radicals and Poles, who by joining issues have hitherto controlled the political situation.

The Austrian Landsturm.—A bill for creating a Landsturm in Austria was introduced in the Reichsrath on Feb. 17, and passed on April 16. It provides for the enrollment of all men, not in the regular army, between the ages of nineteen and forty-two. Two classes will be formed. The first includes men between the ages of nineteen and thirty-two; the second from thirty-two to forty-two. The Landsturm will only be employed for the defense of the country. The bill does not apply to the Tyrol or the Vorarlberg. This new reserve army will render the Landwehr available for active service in war-time, thus adding 270,000 men to the fighting strength of the regular army. The Landsturm will give the empire about 330,000 men for garrison duty and national defense, bringing up the total effective strength of the army on a war footing to nearly 1,500,000. All time-expired soldiers within the limit of age, and all persons who have obtained exemption from service in the regular army, will be enrolled in the Landsturm. Even such as are incapacitated for bearing arms by infirmities must serve, if capable of doing work, in the administrative branches of the service. The bill was strongly opposed by the Liberals.

It adds greatly to the financial burdens of the country; and the Germans fear that it will feed the national aspirations of the Czechs, giving them a localized army, which they will endeavor to make national, like the Hungarian Honved, in which the words of command will be given in their own language. The only amendment that was carried provides that, immediately upon the conclusion of a peace, the Landsturm shall be demobilized.

The War of Races.—In Bohemia the Germans strive for a division of the province into two administrative districts. A Central Union of German Agriculturists was formed for this object at Prague, on July 15. An industrial exhibition was also organized in Prague to show the importance of German handicraft in the Czech capital. The transmutation of parties has led Count Taafe lately to draw nearer to the Liberals and conciliate the German nationality. The calling of Dr. von Gautsch and Marquis Beequehem into the Cabinet indicated a new combination less favorable to the Czechs. The refusal to establish a theological faculty in the new University of Prague, the suppression of some schools in mixed districts, the order that officers on admission to the army must pass a strict examination in the German language, and similar measures, showed that the concessions to the Czechs were no longer the order of the day, yet to appease them the Minister of Justice issued on Sept. 23 a decree that gave great offense to the Germans. He ordered that after Jan. 1, 1887, in the superior courts of Bohemia the language in which by a former regulation the final decree is to be rendered must be used by the judges on the bench in their motions and opinions.

Early in March the Austrian Government interdicted the union of Old Catholics in Bohemia, as being a political association. This was the first result of the plan of action adopted by the conference of bishops held in Vienna to deliberate as to how the Old Catholic movement in Bohemia should be coped with. The spread of the Old Catholic doctrines, though springing partly from a spiritual and intellectual impulse, have, however, a strong political motive among the German Catholics that gives the Government a ground for interference.

The Diet of Prague, on a motion of the archbishop of that city, passed a resolution in favor of making religious instruction compulsory in the higher as well as in the lower classes of all state-supported schools.

The Labor Question.—The Austrian Government, in its efforts to combat socialistic ideas by police measures and criminal prosecutions, has achieved as little success as the German authorities with their anti-socialist laws. The clericals in Austria took the first step in legislation for the satisfaction and benefit of the laboring class by introducing and carrying through a law establishing a normal work-day. The Government has procured the enactment of laws establishing accident and invalid insur-

ance, which are a reproduction of the German measures on the subject. On Oct. 5 a bill was introduced in the House of Deputies that emanated from the German fraction, proposing to give the working class a share in the national representation; and an organization through which their separate interests will find expression and self-government in their proper affairs will be introduced. Class representation exists for the mercantile and manufacturing classes through the boards of trade. The land-owners are also represented as a class. The German Liberals propose to establish chamber of labor in each district where a chamber of commerce exists, twenty-six in all, and to allow these chambers, whose members are chosen by all who belong to the sick-fund associations, to send nine deputies to the lower house of Parliament. The Reichsrath enacted a socialist bill, arming the Government with enormous repressive power over suspected revolutionists. Such persons may be placed under police surveillance without judicial sentence, and may be ordered from one town to another, and compelled to report themselves periodically to the police in the places where they are ordered to reside. The new socialist laws passed in 1886 draw a distinction between socialists and anarchists. The latter are subjected to the severest penalties for revolutionary acts, and may be tried without a jury.

In October the Vienna police discovered an anarchist plot to set fire to the lumber-yards by the river and various parts of the city. Seventeen suspected conspirators were arrested in Vienna. A dynamite cartridge was found placed in a position to destroy one of the bridges across the Danube. Stores of explosives and weapons were discovered secreted in houses. There were others arrested as confederates in other towns. The plot was traced to anarchists in London and the United States, and was to have been carried out by persons recently returned from America.

The Burning of Stry.—The town of Stry, in Galicia, forty miles from Lemberg, was entirely destroyed by fire during a gale on April 17. The loss exceeded \$3,000,000. The number of persons left homeless was 15,000. All the public archives and registers and the private deeds were lost. Over 100 persons were burned to death; others lost their lives in sanguinary fights with robbers. The people camped out on the neighboring plain, where many old persons died from exposure, and were soon reduced to a famishing condition. Car-loads of provisions sent from Lemberg were plundered by the disorderly. This class was augmented by some of the neighboring peasantry, who had also taken part in the plundering of houses during the conflagration. The starving citizens invaded farm-houses in search of food, and many acts of brigandage and bloodshed took place. There were other destructive fires in Galicia, due to the imprudent use of petroleum. Besides several small-

er places, the town of Kalusz was destroyed in September, with a loss of nearly \$1,000,000 in buildings, leaving 3,000 persons shelterless and without the means of subsistence.

Hungary.—The Parliament is composed of a House of Magnates and a House of Representatives. The House of Magnates, under the reform act of 1885, includes all hereditary peers who pay over 3,000 florins per annum in land-taxes; 50 archbishops, bishops, and other dignitaries of the Roman Catholic Church and Greek Orthodox Church, with lay delegates from the Protestant and Jewish bodies; 100 life-peers appointed by the King, a category which was represented in the first Parliament under the reform act by 50 members that were selected by the house itself; ten official members, being state dignitaries and judges of the highest courts, and the archdukes who have reached their majority. In the first session of the reformed Chamber of Peers there were 22 archdukes and 233 resident Hungarian peers who held seats under the tax limitation. The lower house is composed of delegates elected by the direct suffrage under a low property or educational qualification. The house in 1885-'86 consisted of 453 members, of whom 337 represented Hungarian towns and districts, 76 were elected from Transylvania, and 40 were delegates from Croatia and Slavonia.

A bill prolonging the duration of Parliaments from three to five years was finally enacted in January, 1886, by a large majority.

The ministry is composed of the following members: President of the Council, Koloman Tisza; Minister of Finance, Count Gyula Szapary; Minister of the Honved, Baron Geza Fejervary; Minister near the King's person,

Baron Orczy; Minister of the Interior, Koloman Tisza; Minister of Education and Public Worship, Dr. August Trefort; Minister of Justice, Theophile Fabinyi, previously President of the Court of Cassation, appointed May 15, 1886, in the place of Dr. Theodor Paurer, deceased; Minister of Communications and Public Works, Baron Orczy, appointed *ad interim* in the place of Baron Kemeny, who resigned on Sept. 25, 1886; Minister of Agriculture, Industry and Commerce, Count Paul Szechenyi; Minister for Croatia and Slavonia, Koloman de Bedekovich.

Hungary has developed the parliamentary system of government to a high degree, and views with anxiety the deviation of Austria under the present ministry from the principles of parliamentary government that were cultivated during the ascendancy of the German Liberal party.

Finances.—The revenue for 1884 was 310,858,230 florins, including 6,800,000 florins obtained as part of a loan; the expenditure, 318,605,680 florins. The estimated revenue for 1885 was 326,317,695 florins; estimated expenditure, 337,998,528 florins. The total revenue for 1886 is estimated at 329,790,397 florins. The estimated expenditure amounts to 344,651,674 florins, of which 316,502,871 florins are ordinary expenditure. The special debt of Hungary, which is still increasing, owing to the constantly recurring deficits, amounted in 1885 to 127,158,000 florins. The annual charge of the special and common debts amounts to 37 per cent. of the revenue.

In the budget for 1887 the total expenditures are estimated at 350,400,000 florins, and the receipts at 328,300,000 florins.

B

BAMBOO. It has long been known to botanists that a species of bamboo with a square stem grows in Japan, and more recently it has been learned that a similar species exists in China. Until within a few years it was supposed that this peculiar shape resulted from some of the ingenious artificial appliances that the Mongolian races so successfully employ in producing curious horticultural freaks; but it is now known, on the authority of botanists resident in China and Japan, that the quadrangular form is a natural growth. In China, whence it was probably transplanted to Japan ages ago, its geographical range is from 25° to 30° north latitude, along the coast, and as far into the interior as investigations have been made. It sprouts late in the season, and the stems are usually from two to five feet long, when the growth is checked by the cold of mid-winter. In the spring, the growth begins again, and in the course of the season the plant attains its full height of ten to fourteen feet, with a maximum diameter of one inch

and a half. The peculiar shape is not fully developed until after the second or third year. Like many other species, its lower joints are thickly set with thorns. Chinese tradition ascribes to it a miraculous origin. The famous alchemist, Ko-Hung, had a pair of artificially squared bamboo chopsticks, which he thrust into the soil of the temple-garden at Ningpo, where they took root, and a new species of bamboo was created. It is recorded that in 650 A. D. the reigning Emperor sent to Chekiang, where the square bamboo was specially cultivated, for specimens to plant in the imperial park. The Chinese regard it with superstition, ascribing to it miraculous powers. It is cultivated mainly for ornament, in gardens and temple courts. The larger stems are used for staves, and the smaller for pipe-stems. No flowering specimens of this bamboo have been received by competent botanists, and its final classification is not positively settled. It has been named by Fensi *Bambusa quadrangularis*, and specimens are now growing in the

botanical gardens at Kew, England, and in other European conservatories. The Japanese

SQUARE BAMBOO.

varieties are described in at least two Japanese books, written early in the present century.

BAPTISTS. General Statistics of the Regular Baptists.

The "American Baptist Year-Book" for 1886 gives in its summaries of the statistics of the regular Baptists in the United States the following numbers: of associations, 1,305; of ordained ministers, 16,191; of churches, 28,953; of additions by baptism, 135,840; of members, 2,572,238; of Sunday-schools, 12,550, with 93,426 officers and teachers, and 858,969 pupils. Value of church property, \$33,813,454. Amount of the year's contributions: for salaries and expenses, \$4,924,553; for missions, \$709,163; for education, \$112,259; for miscellaneous purposes, \$1,367,831; aggregate, \$7,113,808. In all of North America, including the United States, there were 1,329 associations, 29,886 churches, 16,780 ministers, and 2,675,594 members. The membership in the other countries than the United States is distributed as follows: in Canada, 28,345; in Mexico, 487; in New Brunswick, 12,172; in Nova Scotia, 24,160; in Prince Edward Island, 1,672; in the West Indies, 36,520. In South America, the Baptists have in Brazil, in the missions of the Southern Baptist Convention, 5 churches, 3 ministers, and 113 members. In Europe, 67 associations, 3,322 churches, 6,169 ministers, 6,911 baptisms, and 372,112 members were returned. Outside of Great Britain, the denomination is most numerously represented, of the several European countries, in Germany, where there are 33,483 members, and Sweden, where 27,135 members are returned. The Australian colonies returned 5 associations, 138 churches, 91 ministers, and 11,589 members, who were distributed as follows:

in New South Wales, 934 members; in New Zealand, 2,244; in Queensland, 1,093; in South Australia, 3,218; in Tasmania, 150; in Victoria, 3,950. The Asiatic missions return, altogether, 5 associations, 764 churches, 500 ministers, 3,745 baptisms, and 66,422 members. In Africa there were reported 2 associations, 94 churches, 61 ministers, and 7,297 members. The total of the Baptist churches in the world is 1,408 associations, 84,209 churches, 23,604 ministers, and 3,135,127 members, with, so far as was reported, 148,641 baptisms during the year. One hundred and twenty-five institutions of learning in the United States—of which 6 were theological institutions, 29 universities and colleges, 27 schools for the education of young women exclusively, 44 seminaries and academies for young men or for persons of both sexes, and 19 institutions for the colored race and Indians—returned aggregates of 696 instructors, 16,426 pupils, 1,503 of whom were preparing for the ministry, and real estate valued at \$7,718,716. The returns of endowment funds and income are still incomplete.

Publication Society.—The sixty-second annual meeting of the American Baptist Publication Society was held at Asbury Park, N. J., May 29. Mr. Samuel A. Crozer presided. The receipts of the society had been \$494,352 in the business department, \$134,255 in the missionary department, and \$27,492 in the Bible department, making a total of \$596,099, and showing an increase of \$69,223 over the receipts of the preceding year. Forty-six new publications had been issued, of which 228,500 copies had been printed; while 533,300 copies of new editions of former publications had also been printed. Thirteen periodicals for children, or for use in Sunday-schools and helps in the study of the Sunday-school lessons, were published by the society. Seventy-nine agents had been employed as missionaries and in the distribution of publications, under whose instrumentality 1,293 persons had been baptized, 37 churches constituted, 450 Sunday-schools organized, and 510 institutes held and addressed. Grants of libraries, books, tracts, etc., had been made in 2,500 cases, to the money value of \$12,133. It was reported of the Bible work of the society, that of the 38,595 copies of the Scriptures which had been given away or sold, only 580 copies of the Bible Union version and "Canterbury Revision" had been circulated, although all of these that were desired had been granted; and of \$28,000 received for Bible work, only \$50 were specially designated for any English version of the Scriptures other than the "Authorized Version."

Home Mission Society.—The fifty-fourth annual meeting of the American Baptist Home Mission Society was held in Asbury Park, N. J., May 27. Mr. Samuel Colgate, of Orange, N. J., presided. The total receipts of the society for the year had been \$382,314, of which \$259,721

BAPTISTS.

had been contributed by churches, Sunday-schools, and individuals; \$27,383 were in the shape of individual contributions to conditional and permanent trust funds; \$46,296 were derived from legacies; \$19,002 from investments and interest on church-edifice loans; \$19,086 from students' fees; and \$13,688 from women's home mission societies. The expenditures had been \$280,523; the debt had increased from \$117,988 to \$123,428; missionary operations had been conducted in 45 States and Territories, and in Ontario, Manitoba, British Columbia, and two States of the Mexican Republic. The whole number of laborers supported, in whole or in part, was 676, of whom 153 had labored among the foreign population, 193 (including teachers) among the colored people, Indians, and Mexicans, and 326 among Americans. These missionaries had supplied 1,512 churches and out-stations, received 3,296 members by baptism, and organized 140 churches; and they reported 28,181 church-members, 699 Sunday-schools, with 45,432 attendants, and benevolent contributions of \$27,092. The society had aided in the maintenance of 17 established schools for the colored people, Indians, and Mexicans, in addition to a day-school for the Chinese and two schools in Utah, the means for the support of which came from the New England Woman's Home Mission Society. Of the schools for colored people, Mexicans, and Indians, 11 were incorporated institutions and 6 unincorporated. In them 108 teachers had instructed 3,326 pupils, of whom 376 had been in the ministry or were preparing to preach, and 1,102 were studying with a view to teaching. Fifteen schools for the colored people returned 1,479 young men and 1,651 young women as pupils. The Indian University, near Muskogee, returned four teachers and seventy pupils, representing six nations or tribes in the Indian Territory. An elementary school was also taught among the Cherokees at Tahlequah. A medical school was conducted in connection with Shaw University, at Raleigh, N. C. Industrial education was given in many of the institutions, six of which had been aided from the John F. Slater fund. Monthly papers were published at eight of the institutions, and two papers were published in connection with the mission in Mexico. In the church-edifice department the society had aided 23 churches by gifts, 36 by loans, and 3 by gifts and loans. These churches provided sittings for 18,415 persons. The whole amount of money thus disposed of was \$26,172, and the property secured by its aid was valued at \$180,690. A special report was made by a committee which had been appointed to examine into the subject concerning the loss which the society had suffered through the financial failure of the agent to whom the investment of its funds had been intrusted, the whole amount of which, classified under eight headings, was given at \$131,521. The committee advised that the amount of those losses be made good by the

society to the funds upon which they fell as soon as possible. The whole matter of the adjustment of the settlement of the losses was referred to the Executive Board. A resolution was adopted asking the enactment by Congress of provisions "for opening at once the pathway into citizenship, self-supporting industry, and civilization before every Indian in the land, so that all may be permitted to accept the duties and receive the protection of United States citizenship at the earliest practicable date."

Missionary Union.—The seventy-second annual meeting of the American Baptist Missionary Union was held in Asbury Park, N. J., May 25th. The Rev. Edward Judson, D. D., presided. The receipts of the society for the year had been \$384,996, of which \$81,679 had been contributed through the women's societies. The year had been closed free of debt. The missions of the Union are in Asia (including Burmah, India, China, and Japan), Africa, and Europe. The Asiatic missions, which are classified as the Burman, Karen, Shan, Kachin, Assamese, Garo, Naga, Telugu, Chinese, and Japan missions, with the African missions, returned 785 preachers, of whom 193 were ordained and 592 unordained, 611 churches, and 56,440 members, with 3,450 persons baptized during the year. The European missions, in Sweden, Germany, France, Spain, and Greece, returned 946 preachers, 609 churches, and 61,892 members, with 5,544 baptized during the year. In all there were 1,731 preachers, 1,220 churches, and 118,332 members, with 8,994 persons baptized. Owing to the recent disturbances in Burmah, the statistics from the missions in that country were very imperfect. The Asiatic and African missions further returned 143 Sunday-schools, with 5,513 pupils, and 802 literary schools, of which 278 were self-supporting, with 16,648 pupils.

Southern Baptist Convention.—The Southern Baptist Convention met in Montgomery, Ala., May 7. The Rev. P. H. Mell, D. D., of Georgia, was chosen president. The Home Mission Board reported that its receipts for the year had been \$94,824. It had employed 255 missionaries and supplied 649 churches and stations, with 326 Sunday-schools attended by 12,531 teachers and pupils. Seventy churches had been constituted, 49 meeting-houses built, and 3,812 persons baptized. The board recommended earnest and vigorous missionary work among the colored people, and desired \$10,000 for the continuance of it and for aiding young colored ministers in securing education. For the first time in the history of the convention more than twenty colored preachers were enrolled among its missionaries. A number of Cubans, converts of the board's mission at Key West, Fla., had gone back to Havana and established there a church and Sunday-school. This enterprise was put under the care of the Home Mission Board as the Cuban mission. The Levering Manual Labor School, in the Indian Territory, was in a flourishing condition.

The receipts of the Foreign Mission Board had been \$83,404. The missions are in China (northern, central, and southern), 547 members; Africa (Lagos), 125 members and 220 pupils; Italy, 11 stations, 288 members; Brazil, 81 members; Mexico, 270 members, 216 pupils.

Gifts were acknowledged of \$60,000 by Baptists in New York and \$25,000 by Baptists of Louisville, Ky., for the Southern Baptist Theological Seminary and the cost of its buildings and grounds. Reports were adopted on systematic benevolence, woman's work in the convention, and temperance. The report on woman's work recognized its value, but did not make any provision for the admission of women into the convention as delegates. The report on temperance pledged the influence of members of the convention in all proper ways for the suppression of the manufacture and sale of intoxicating beverages.

The Baptist Congress.—The fifth annual meeting of the Baptist Congress was held in Baltimore, Md., Nov. 16, 17, and 18. The Rev. W. E. Hatchee, of Richmond, Va., was the president for the year. The following topics, brought up according to a previously arranged programme, were discussed in written papers and appointed and voluntary addresses: "Inspiration of the Scriptures," by the Rev. G. D. B. Pepper, D. D., and the Rev. O. P. Eaches, D. D.; "Faith-Cures," by the Rev. W. H. Whitsitt, D. D., and the Rev. F. H. Kerfoot, D. D.; "The Labor Question," by the Rev. Philip H. Moxom, Hon. James Buchanan, and the Rev. G. T. Dowling; "Religious Instruction in State Education," by Prof. N. K. Davis, the Rev. Galusha Anderson, D. D., LL. D., and the Rev. Walter Scott; "Sabbath Observance (a) Scriptural Grounds," by the Rev. J. F. Elder, D. D.; "(b) Utilitarian Grounds," Rev. Reuben Jeffrey, D. D.; "(c) How best secured," by the Rev. Lansing Burroughs, D. D.; "The Future Life (a) Endless Punishment," by the Rev. E. B. Hulbert, D. D.; "(b) Conditional Immortality," by the Rev. W. H. Robinson; "(c) Future Probation," by the Rev. E. H. Johnson, D. D.; "Popular Indifference to Religion," by the Rev. Malcom McVicar, LL. D., and Rev. John Peddie, D. D.

Free-Will Baptist Church.—The twenty-sixth triennial Free-Will Baptist General Conference met in Marion, Ohio, Oct. 4. The Rev. J. L. Phillips, D. D., returned missionary from Midnapore, India, was chosen moderator. The question which engaged most of the attention of the Conference was that of the union of the Free Baptist and other denominations holding like views with it on questions of doctrine and church polity. Corresponding delegates from the bodies in question were present to express the sympathy of the bodies they represented in the subject of the discussion, as follows: the Rev. J. R. H. Laidlaw, the Rev. R. H. Bolton, from the Church of God; the Rev. D. A. Long, D. D., the Rev. N. Summerbell, D. D., and the Rev. C. A. Tillinghast, from the Amer-

ican Christian Convention; the Rev. William Hayden, D. D., and the Rev. J. M. Atwater, D. D., from the Disciples of Christ; the Rev. T. H. Siddell, from the Free Baptists of Nova Scotia; and the Rev. Smith Baker, from the National Congregational Council. The following is the minute of the action which was taken on the subject:

We, the delegates of the Free Baptist General Conference, acknowledging the manifold blessings with which God has favored the people we represent; recognizing the importance of the work still before our people; taking into consideration the fact that God is moving his children of every name to closer relationships with each other as well as with himself; and, in order that our position may not be misunderstood, hereby set forth the following declarations:

1. We believe in the spiritual unity of all the followers of our divine Lord, and desire so to manifest his spirit as to evince our unity with him and with all who love him.

2. We are ready to form such alliances with other Christian bodies as may promise larger results in advancing our Lord's kingdom.

3. We are ready to join in organic union with such Christian bodies as may so far agree with us in doctrine and usages as to give assurance of continued harmony and peaceful relations in Christian work.

4. We regard loyalty to Christ and the Bible, and the independence of the local church as suggesting a basis on which closer relationship with other Christian bodies may be attained.

5. We direct the Conference Board to take into consideration and report upon at the next General Conference such opportunities for closer relationships with other Christian bodies as may in their judgment give promise of increasing our own work in helping bring the world to acknowledge Christ as King of kings and Lord of lords.

A committee of five persons was appointed to confer with committees from the Christian Connection, the disciples of Christ, and the Congregationalists, and another committee to confer with a committee from the Church of God on the subject of Christian union; and both committees were given power to act for the conference as their wisdom and best judgment might direct. The conference directed a Christian Convention of Liberal Baptists to be called to meet at Ocean Park, Old Orchard Beach, Maine, in August, 1887. An agreement for co-operation in foreign missionary work, particularly in lower Bengal, India, was made between the Foreign Mission Boards of the Free Baptists and of the Church of God. Acknowledgments were made to the Rev. S. P. Smith for a gift of \$10,000 to Hinsdale College; to Winnebago City, Minn., for an offer of \$12,000 and forty acres of a land for a Free Baptist institution of learning to be placed there; and to the Hon. J. L. H. Cobb for a gift of \$25,000 to Bates College, conditioned upon the denomination adding \$75,000 to it.

Union Convention.—An informal convention of delegates from four conferences and one quarterly meeting of the American Christian Convention and six associations and quarterly meetings of the Free-Will Baptist Church, all in New England, met in Boston, March 10, to consider upon promoting a union of the

two denominations. The Rev. I. D. Stewart, Free-Will Baptist, and the Rev. I. H. Coe, of the Christian Connection, were elected joint presidents of the convention. A paper was presented embodying "a statement of general sentiments held by the Christians," which received that—

The Churches of the Christian denomination in association with the American Christian Convention, while disowning all formal creeds, considering the Holy Bible to be a sufficient rule of faith and practice, and Christian character or vital piety the only test of Christian fellowship, have yet found, as a result of loyalty to Scripture teaching, that in practice they receive and maintain, with great unanimity, the following important principles of evangelical or gospel truth :

1. That the Holy Bible, or Scriptures of the Old and New Testaments, is given by inspiration of God, and is consequently to be accepted as the authoritative standard by which religious teaching and human conduct are to be regulated and judged.

2. That Holy Scripture reveals to us one God the Father Almighty, of whom are all things and we in him; and one Lord Jesus Christ, the only-begotten of the Father, the brightness of God's glory and the express image of his person, by whom are all things and we by him; and the Holy Ghost, the renewer, comforter, and sanctifier, who with the Father and the Son together is worshiped and glorified.

3. That the love of God to sinful men has its highest expression in the gift of his Son, who, laying aside the glory which he had with the Father before the world was, took upon him man's nature, and at last suffered upon the cross, that we through his death might have life.

4. That the grace of God in the gospel is freely offered to all men, and that all who believe in Christ and heartily accept him in this life as their Saviour, are regenerated through the power of the Holy Ghost, and become heirs of salvation.

5. That the Church of Christ, invisible and spiritual, comprises all true believers in Christ, whose duty it is to associate themselves in churches for the promotion of spiritual growth and Christian fellowship, for the observance of the ordinances, for the teaching of gospel truth, and for a zealous effort for the conversion of men; and that these churches, in fellowship with one another, may determine—each for itself—their organization, beliefs and forms of worship, and should co-operate together to manifest their unity in Christ in the face of all mankind.

6. That the Scriptures teach the ultimate prevalence of the kingdom of Christ over all the earth; the glorious appearing of the great God and our Saviour Jesus Christ, the resurrection of the dead, and a final judgment of the wicked to eternal punishment, and of the righteous to life everlasting.

NOTE.—The churches of the Christian denomination almost uniformly administer baptism by immersion, but regularly invite all Christians, without distinction of denomination or opinion, to the Lord's Table.

A resolution was passed expressing the sense of the meeting that a union of the two denominations was desirable, if it could be accomplished without detriment to the interests of the cause of either body.

A committee was appointed to draw up a basis of union, with authority to call a general convention of representatives of the two bodies when prepared to present its report.

This convention met in the city of New York, May 5. The Rev. J. D. Stewart, of New Hampshire, presided. A draft of a basis

of union was adopted, after several propositions had been received, as follows:

The Free Baptist and Christian Churches, perceiving their unity in the reception of the Holy Scriptures as given by inspiration of God, and as the only rule of faith and conduct; and that Christian character, attained in the exercise of saving faith in the Lord Jesus Christ, by the washing of regeneration and the renewing of the Holy Spirit, is the indispensable condition of admission to the ordinances of the gospel, and to the fellowship of the Church; and recognizing one Lord, one faith, one baptism, one God and Father of all, who is above all and through all and in all; deplored the evils of needless division, conceding the liberty of the several churches to retain or adopt such local name, covenants, forms, and usages as they may desire, in due subordination to the precepts of God's Word, do hereby propose to form a union as follows :

1. In efforts to carry out the command of our divine Lord, "Go ye into all the world and preach the gospel to every creature."

2. In efforts for the more effectual preaching of the gospel at home in order to the promotion of piety among Christians and the conversion of sinners, regarding the gospel to be the power of God unto salvation to every one that believeth.

3. In improving the condition of our Sunday-schools, in establishing new schools, and in taking measures to have the statistics of all these schools annually reported and published.

4. In endowing and supporting the institutions of learning already existing in either body represented in this committee, and in founding such new ones as may be deemed expedient.

5. In the sustaining of such periodicals as are now published by both bodies, and in publishing a year-book and a religious quarterly or magazine by some person or persons in good standing in either denomination.

6. We recommend that such churches, conferences, quarterly meetings, and other bodies, as occupy closely connected territories, unite. That ministers of each denomination form organizations for religious worship, biblical research, and mutual improvement, and that the weak churches and scattered families of the above-named bodies be brought together as rapidly as practicable.

7. That independent churches in sympathy with this movement be advised to unite with some association already existing in either body, or to form themselves into new associations to be connected with one body or the other.

8. In entering this union, neither the Free Baptists nor the Christians relinquish their name, doctrine, church polity, fellowship or principles of communion; but they rather emphasize whatever they have heretofore taught, and what they now consider, as biblical, evangelical, charitable, and true; each, however, observing that truth for itself, without attempting to force it upon another; yet hoping that, by fraternal association and mutual forbearance, variations may vanish away, and that both may be so assimilated in the spiritual church as to become one people in every particular; for which we will labor and pray.

A joint committee was chosen, by resolution of the convention, to arrange for carrying out the provisions of the basis of union, with power to present questions of policy that might arise to the general bodies of the two denominations, if it should be deemed advisable for the promotion of the objects of the movement.

Seventh-Day Baptists.—Statistical returns made to the Seventh-Day Baptist General Conference from 74 out of the 97 churches of the denomination, show an entire membership of

8,228. The net increase of members during the year had been 118. The amounts of funds raised were: For pastors' salaries, \$19,432; for Sabbath-schools, \$1,243; for the Tract Society, \$6,512; for the Missionary Society, \$4,690; for other work, \$10,382; total, \$42,260. The number of members of Sabbath-schools was returned at 4,753, with 321 teachers.

The accounts of the Seventh-Day Baptist Education Society, including invested funds, were balanced at \$46,441. Alfred University returned an average attendance during the collegiate year of 286 students, with a total of 412 individual registries; Milton College had 259 students, and Albion Academy an average attendance of 73 students.

The receipts of the year of the American Sabbath Tract Society were \$15,350. The printing-house had done a business of \$16,406 in the publication of the periodicals of the denomination, the book entitled "Sabbath and Sunday," and tracts. Of the six periodicals, one was in the Swedish language and one in the Dutch. Besides the main depository at Alfred Centre, N. Y., sub-depositories have been established at Texarkana, Ark., and Minneapolis, Minn. The society at its annual meeting, September 26, recommended the publication of a Seventh-Day Baptist Hand-book, to contain an outline of the denominational history, statements of the views of Christian doctrine, practices, and church polity recognized by the denomination, and an account of the present condition and work of the General Conference and the societies.

The receipts of the Seventh-Day Baptist Missionary Society for the year had been \$13,572, or \$3,685 more than the receipts of the previous year, and the expenditures had been \$10,447. In the Home Missions 82 members had been added by baptism. From the mission in China (at Shanghai) were returned 3 American missionaries, 3 native preachers, 4 teachers, and 4 regular and 2 occasional helpers in the medical mission. The mission-schools had been attended by 26 boys and 9 girls. The mission in Holland returned 2 stations (Haarlem and Frieschlo), with 1 minister at each, and an increase of 13 in the number of Sabbath-keepers.

The Seventh-Day Baptist General Conference met in its seventy-second session at Milton, Wis., September 12. Mr. George H. Babcock presided. The amount of the memorial fund was reported by its treasurer to be \$80,212. Its income for the year had been \$3,640. The Woman's Executive Board reported that it had received \$3,062, that it had endeavored unsuccessfully to pay the salary of one missionary and an equal amount to the Tract Society, and that it had kept up a regular correspondence with the missionaries in the foreign field. The Committee on Denominational History presented a report urging the pastors of churches to gather such materials as could be used in preparing histories of those churches, which should describe not only the leading events in

their careers, but also the effect of salient principles or doctrines as felt in their growth. Upon the advice of the Executive Committee, the Conference decided to appoint a committee to open correspondence with persons of whom they might learn, who are interested in the Sabbath cause, with power to recommend the organization of groups of Sabbath-keepers, where such exist, if they see fit, into churches. The three topics, "Is Denominational Growth desirable, and, if so, why?" "What are the Elements of Denominational Growth?" and "By what Methods can Denominational Growth be promoted?" were discussed by the Conference. A declaration was adopted expressing it as the general belief of the denomination, with a few dissentients, that the Lord Jesus Christ, according to the Scriptures, will certainly and personally come again "without sin unto salvation"; that there will be a resurrection of the dead, both of the just and the unjust; and that while the day and the hour when either of these events will happen is not known, "God has appointed a time for each of them, and they will certainly occur in his own appointed time." A declaration was adopted approving the principle of the prohibition of the manufacture and sale of intoxicating liquors; declaring the license system, high or low, as applied to the liquor-traffic, wrong; and approving laws of States that require instruction in public schools regarding the effects of alcohol and narcotics on the human system.

Baptists in England and Ireland.—The spring meetings of the Baptist Union of England and Ireland, and of the societies affiliated with it, were held in London, beginning May 10. The Rev. Charles Williams presided and delivered the opening address. The report of the Council showed that the total sum raised by the members of the Baptist churches for all purposes had been £610,000, and that the ratio of their contributions was equivalent to 2½ per cent. of their income.

The report of the Council showed that at the end of 1885 accommodation was provided in 3,654 chapels in Great Britain and Ireland for 1,181,000 persons. The reported membership in 2,713 churches was 315,940, or 3,470 in excess of the registry of 1884. The number of Sunday-school teachers was 49,440, and of pupils in Sunday-schools, 472,000, showing an increase of 700 teachers and 4,000 pupils. The sum of £40,000 had been expended upon new chapels, securing a provision of 11,400 sittings; £56,000 had been spent in chapel improvements, new school-rooms, class-rooms, etc.; and £90,000 had been paid toward the removal or diminution of debts.

The Baptist Building Fund returned an income from subscriptions, gifts, and returns of loans, of £8,109, of which £7,675 had been disbursed in thirty fresh loans. The total amount granted from the fund to 750 churches exceeded £148,000, and the officers held in custody 141 trust and title deeds.

Baptist Missionary Society—The Baptist Missionary Society returned an income for the year of £61,417, being an increase, as compared with the previous year, of £2,273; but the expenditure had exceeded that sum.

The Baptist Zenana Mission reported that its force of laborers included 42 zenana visitors, 25 assistants, and 104 native Bible-women. These were laboring in 18 different districts, visiting regularly 986 zonanas, and teaching daily some 1,500 people. The society closed the year with a debt of £280 standing against it.

The autumnal session of the Baptist Union was held in Bristol, beginning October 4. The meetings were devoted chiefly to discussions, in formal addresses and written papers of subjects relating to the prosperity and growth of the denomination, and of the various enterprises in missions—domestic and foreign—education, and church building and extension, in which the Union is actively interested. The Baptist Zenana Mission (for India) reported that its expenditures for the year had been a little more than £6,000, and that some of the girls who had been in its schools were now teachers. The receipts of the Baptist Annuity Fund for the year had been £9,315, and its total investments to September 30 had been £109,738. The number of beneficiary members was 843, and of annuitants 121, while 142 fresh applicants to be beneficiary members had been accepted. The British and Irish Home Missions reported a deficit of between £600 and £700. A resolution was adopted pertinent to the approaching jubilee of the Queen's reign, directing the preparation of an address to her Majesty and the offer of other suitable testimonials of loyalty.

Baptists in Scotland.—The annual meeting of the Baptists of Scotland was held in Glasgow in October. The Rev. F. H. Roberts presided. An increase of 512 members was reported, and the whole number was now 9,930. A congratulatory address to the Queen on the occasion of her approaching jubilee, and resolutions in favor of disestablishment and of international arbitration, were adopted.

General Baptists.—The General Baptist Association met at Leicester in June. The statistical report showed that there were in England 192 General Baptist churches, with 25,826 members. The "Association Letter" dwelt upon the ministry of religious truth in the villages of England, and recommended the grouping of villages under the leadership and in the circuit of town churches.

BELGIUM, a constitutional, representative, and hereditary monarchy in Western Europe. The legislative authority is vested in a Parliament consisting of two chambers. The senators are elected for a term of eight years, one half retiring every four years. The members of the House of Representatives are elected for four years, one half being replaced every two years. The representatives are elected by vote of all citizens paying direct taxes annually to

the amount of 42 francs. The electoral lists in 1885 contained 126,419 names, being one out of every thirteen adult males.

Area and Population.—The area of the kingdom is 11,373 square miles. The estimated population at the beginning of 1885 was 5,784,958, of which number 2,890,812 were males and 2,894,146 females. The number of births in 1884 was 176,721; deaths, 121,070; marriages, 39,209; natural increase of population, 55,651. There was an increase by immigration of 2,565 persons in 1884. The population of Brussels, the capital, on Jan. 1, 1885, was 403,389, inclusive of the suburbs; Antwerp had 191,124 inhabitants; Ghent, 140,926; Liège, 133,044; Mechlin, 46,499; Bruges, 45,559; Verviers, 44,667; Louvain, 37,490; Tournai, 33,773; Seraing, 30,607.

Commerce.—The total volume of the general commerce in 1883 was 5,410,900,000 francs. The special imports amounted to 1,552,131,000 francs, and the special exports to 1,343,126,000 francs. Chief among the special imports were cereals and rice of the value of 296,966,000 francs; wool, woolen tissues, and yarn, 127,847,000 francs; metals and minerals, 114,929,000 francs; textile fabrics, excepting cottons, woolens, and silks, 89,782,000 francs; hides, 80,782,000 francs; live animals, 72,785,000 francs; oil-seeds, 57,750,000 francs; cotton, 56,416,000 francs; timber, 48,290,000 francs; coffee and sugar, 47,921,000 francs; chemical products, 34,473,000 francs; butter, 25,820,000 francs; flax and hemp, 13,034,000 francs; vegetables, 11,093,000 francs. All other classes of imports amounted to 474,514,000 francs. The exports of the different classes of domestic products were of the following amounts: cotton, woollen, and linen thread, 121,340,000 francs; cereals, 107,837,000 francs; machinery, 92,625,000 francs; coal, 85,329,000 francs; stones, 74,870,000 francs; vegetable fibers, 67,599,000 francs; cotton, woolen, and linen tissues, 66,782,000 francs; wrought-iron, 63,938,000 francs; glass, 56,602,000 francs; sugar and molasses, 56,435,000 francs; hides, 51,936,000 francs; raw zinc, 35,916,000 francs; oil-seeds, 25,525,000 francs; resins, 17,685,000 francs; candles, 14,432,000 francs; food preparations, 14,174,000 francs; vegetables and roots, 12,606,000 francs; all other articles, 349,831,000 francs.

The imports from France amounted to 307,146,000 francs; from Germany, to 233,100,000 francs; from the Netherlands, to 210,021,000 francs; from Great Britain, to 197,865,000 francs; from the United States, to 159,554,000 francs; from Russia, to 133,634,000 francs; from Asiatic countries to, 80,862,000 francs; from the Argentine Republic, to 48,436,000 francs; from Sweden and Norway, to 34,914,000 francs; from Italy, to 22,283,000 francs; from Brazil, to 22,265,000 francs. The exports to France were of the value of 415,465,000 francs; to Great Britain, 273,594,000 francs; to Germany, 229,390,000 francs; to the Neth-

erlands, 177,030,000 francs; to the United States, 43,342,000 francs; to Spain, 38,665,000 francs; to Italy, 30,844,000 francs; to Switzerland, 22,030,000 francs; to Asia, 12,843,000 francs; to the Argentine Republic, 10,203,000 francs; to Brazil, 10,059,000 francs.

Industry.—An official return relative to the collieries gives the output in 1885 as 17,000,000 tons, as compared with 18,000,000 in 1884; the number of pits worked as 285, as compared with 289; miners employed, 103,095, as compared with 105,182; average annual pay, 813 as compared with 914 francs; cost of extraction per ton, 8 francs 67 centimes, as compared with 9 francs 18 centimes; produce of sales per 1,000 kilos, 8 francs 87 centimes, as compared with 9 francs 53 centimes; aggregate profits, 6,929,055, as compared with 6,250,110 francs.

Navigation.—The maritime commerce is carried on chiefly by British vessels. The commercial marine in 1883 numbered 62 vessels, of 86,360 tons, of which 47, of 79,902 tons, were steamers. The total tonnage entered at Belgian ports in 1884 was 4,064,816; cleared, 4,032,317 tons.

Railroads.—The length of railroad lines in operation on Jan. 1, 1885, was 2,730 miles, or 4,366 kilometres, of which 3,110 kilometres were worked by the state and 1,256 kilometres by companies. The gross receipts in 1884 were 162,172,058 francs, the expenses 95,368,409 francs. The state had spent, up to the end of 1883, 888,404,000 francs in the construction of railroads, and had purchased lines by means of annuities of the capital value of 319,798,000 francs.

Posts and Telegraphs.—The post-office in 1884 forwarded 88,203,550 private and 13,793,075 official letters, 24,748,490 postal-cards, 54,959,000 circulars, and 94,522,000 journals.

The telegraphs transmitted, in 1884, 6,788,071 dispatches. There were, on Jan. 1, 1885, 3,749 miles of state lines, and 17,587 miles of wires. The receipts in 1884 were 2,637,074 francs; expenses, 3,435,327 francs.

The Army.—The standing army in 1886 numbered 47,237 men of all ranks. The war strength is 103,860 men, with 18,800 horses, and 240 guns. There is besides a civic guard, numbering in 1884 34,985 men, and a gendarmerie of 2,011 men.

Finances.—The budget for 1886 makes the total ordinary revenue 320,555,406 francs, of which 132,821,000 francs are derived from railroads, posts, and telegraphs; 37,367,200 francs from excise duties; 25,579,900 francs from land taxes; 25,531,600 francs from customs duties; 24,360,000 francs from registration and other fees; 19,320,000 francs from succession duties; and 19,066,000 francs from personal taxes. The total ordinary expenditure is estimated at 319,166,330 francs, of which 102,583,964 are required for the interest on the debt; 89,176,814 francs for railroads, posts, and telegraphs; 45,624,100 francs

for the army; and 22,155,898 francs for public instruction. The ordinary budget in 1885 showed a small surplus, but the extraordinary expenditures left a deficit of about 38,500,000 francs. The public debt in 1886 amounted to 1,780,727,000 francs, not including 16,446,000 francs of annuities. The 4 per cent. consols, amounting to 1,048,000,000 francs, are being converted into 3½ per cents. The other debts pay 3 and 2½ per cent.

The bill for the conversion of the 4 per cent. debt into 3½ per cent. bonds, which could be effected at par, and will save 5,300,000 francs a year in interest, was passed by the Chambers in November, 1886.

Legislation.—In 1870 the Liberal ministry of Frère-Orban proposed to create a reserve army of 30,000 men, but the measure was defeated by the clerical vote. The Clericals upon coming into power themselves concluded that the existing military establishment was insufficient for the security of the frontier, and a bill to increase the standing army was brought in by Minister Pontus, which was carried in the lower chamber on Feb. 12 by a vote of 70 to 52. The plan, which was denounced by Frère-Orban as a waste of money, is to promote 54 captains and to create their commands when necessary in the future by prolonging the term of liability to service in five classes of the militia from eight to thirteen years. The reserve men who are affected by the law are of the class not qualified to vote, while the property-owning class escapes.

In a bill dealing with authors' rights in literary property, a clause was inserted providing that newspaper intelligence or telegrams must not be reproduced without indicating the source if accompanied by a notice from the editor prohibiting republication.

The Belgian Senate in March voted against sending a minister to Rome, on the ground that the Kingdom of Italy had robbed the Pope of his rights.

In the beginning of June elections were held for the renewal of half the members of the Chamber. The result was favorable to the Clericals, who before the elections had 86 members to 52 Liberals, and after, 98 to 40.

Labor Riots.—The deplorable condition of the 100,000 miners in Belgium led to a series of strikes and riots, which at times assumed a most alarming character. The miners' wages, which in 1873 averaged \$264 per annum, were reduced from time to time, until in 1884 they were \$183. The average day's wages in the mines of Seraing was 52 cents, and at Liège the common rate was 48 or 50 cents, and the highest 79 cents. The only food of the miners is bread, sometimes flavored with oleomargarine, or a taste of sausage made of pork and horse-flesh. On Sundays they may have a little meat. The mine-owners asserted that, owing to the depth of the mines, they could pay no higher wages and compete with German and other foreign coal-mines. The capital in-

vested in Belgian coal and iron works has yielded, it is calculated, not over 2 per cent. per annum during the past ten years. In 1885 there was a great strike in the Borinage, and the miners brought their grievances forward pacifically, but nothing was done. The coal-trade was generally believed by the miners to be more prosperous than usual, but a steady reduction of wages had been enforced. The first alarm was created on March 18, at Liège, by an anarchist meeting, which was called to celebrate the anniversary of the Paris Commune. The meeting was orderly, but when the audience left the hall they were attacked by armed police, their flags destroyed, and the people roughly handled. The miners, incited by one Wagener, of Herstal, then began to destroy property and plunder shops and hotels. A number of the rioters were arrested, among them the leader. The disturbance took the form of a general strike among the miners in the Liège district, and soon extended to the surrounding districts. Strikes against reductions of wages were the ostensible cause of the riots, but the discontented workmen began to attack property and capital in every direction. All work was stopped throughout the districts of Liège, Charleroi, and Mons, and manufactories of all kinds, especially glass-works and iron-works, were attacked by the rioters, and in many cases destroyed; villages were plundered, and many country-houses were pillaged. The civic guard was called out, and stationed at points threatened by the strikers. Collisions between the rioters and troops were frequent, and many lives were sacrificed. The Sariemont colliery was attacked by 300 rioters, who were fired upon by the troops, with a loss to the former of fourteen killed and wounded. In attempting to stop the work of the mines at Carnières and Ressaix, the rioters were again fired upon, after having been ordered to disperse, and three men were killed and fourteen wounded. For several days the strike gained headway in Liège, Charleroi, Tournai, Mons, and the neighboring districts, and great damage was done to private property. Toward the end of March the former rates of wages were restored in the mines, and the striking miners returned to work. During the strikes over fifty men were killed or wounded, and property of the value of millions of francs destroyed. At Gosselies a large glass-factory was burned, and five mansions destroyed. The glass-works were a model establishment, employing 950 men. They were defended by 32 lancers, who were soon routed by the mob armed with stones.

By the 26th of March the general strike began in the industrial district of Charleroi, the seat of the Belgian glass industry. At Lodelinsart three glass-factories were destroyed. Coal-mines, glass-works, rolling-mills, and foundries in various localities were forcibly closed by rioters. At Acoz gendarmes charged into a crowd and wounded several persons. At Cha-

teaulineau there was a collision with troops, and many were hurt on both sides. The soldiers in some cases refused to use their weapons against the people, and there were several trials of privates and non-commissioned officers for insubordination. The glass-works at Jumet, and several country-houses in the neighborhood of Ligny, Fleurus, and Chassart, were burned on March 27. Other important glass-works and two convents were set on fire. At Roux seven men were killed and eight wounded. The army reserves were called out, and a large military force concentrated at Charleroi. A body of strikers who attempted to enter the town were fired upon, and some of them killed. Ball-cartridges only were served out to the troops. A state of siege in the districts affected by the strikes was proclaimed on March 28. The production of window-glass had outstripped the demand, and caused the Belgian manufacturers to reduce their output to one third less than in 1885. Many men were thus thrown out of employment, while the wages of the rest were reduced 10 per cent. or more. The overproduction in Belgium was traceable to improvements, notably the great tank-furnaces, invented by Siemens, adopted by a few of the large manufacturers. The Belgian glass-blowers, whose difficult and exhausting trade was handed down from father to son, considered that these large capitalists, who, besides displacing men by mechanical improvements, sought cheaper labor among the peasantry, had robbed them of their occupation, in which, owing to the superiority of Belgian glass, they would otherwise be able to compete with all the world. The smaller manufacturers, who were fast being driven out of business, held the same belief. This was the cause of the acts of incendiaryism committed by the infuriated workmen, who burned the great factories in the hope of bringing back the old conditions.

At Brussels there were meetings at which the police and the Government were denounced for the course they had taken, and when the police interfered the crowd attempted to make a demonstration before the Royal Palace, but were violently dispersed by the police. The radical press argued that such disturbances could not occur if the workingmen possessed the right of suffrage and representation of their interests in the legislature. Some newspapers proposed that the Government should purchase the coal-mines. The leading Clerical organ said that the social question must thenceforth take precedence of political questions. On the 1st of April there were 15,000 men on strike in the Charleroi district and many thousands elsewhere, but in the Liège district and other places where the troubles first broke out, comparative quiet prevailed when the disturbances began around Charleroi and Mons, and the men were now returning to work, having obtained concessions.

With 12,000 troops in the Charleroi district, disorders were easily checked, and on April

6 Gen. Vandersmissen, the commander, announced that order had been re-established. About 30 strikers altogether were killed by the soldiers in the various disturbed districts.

The Labor Question.—Before the March riots there was no Socialistic party in Belgium, such as exists in France and Germany. There were a few writers and speakers whose utterances awakened sympathy with the revolutionary strivings in the neighboring countries; but in Belgium trade-unionism and co-operation were the practical aims presented in their teachings. Universal suffrage has long been regarded by the industrial laborers as the means by which they will eventually gain their rights. Shut out from representation, they conceive that they are the victims of class legislation, in spite of the many liberal features in the laws of Belgium. Yet the school question has overshadowed all others in recent years. The industrial workmen are friends of secularism and state education, and the immediate effect of universal suffrage would be to strengthen the Clerical party. In Liège, where the labor troubles began, there was no organized labor party. The repressive zeal of a senator, who induced the police to interfere in an unnecessary and unusual manner, began the trouble. The riots excited the public mind in Belgium more than any event in recent times. The authorities were at first inclined to believe that propagandists of German Socialism had instilled discontent among the workingmen, and many Germans were expelled as suspected teachers of revolution; but the conviction gradually grew in the public mind that in this wealthy country (which, under the international guarantee of peace, had grown rich by peaceful arts, while its neighbors suffered from burdensome armaments and exhausting wars) the classes that had produced its wealth were sinking into intolerable wretchedness, and had been driven by blind despair to a Jacquerie such as has hardly been witnessed in this century. The first thoughts of the legislators were to render public order more secure by placing effective restraints on unruly spirits, and thus prevent further outbreaks. Government bills were passed imposing the penalty of imprisonment from a week to three years for provocations to riot, crimes, or misdemeanors. Another restricts the sale of firearms and regulates the carrying of weapons. One was passed also authorizing the Government to watch over the manufacture, storing, sale, transport, use, and possession of explosives and engines for using them. Authority was given also to advance money at $3\frac{1}{2}$ per cent. to persons whose property had been injured in the labor riots. On June 4, a Socialist editor at Ghent, named Anseele, was convicted of contesting the obligatory force of the laws in urging the relatives of soldiers to use their influence with them to induce them not to act against the workmen during the strike, and was condemned to six months' imprisonment. The same day Alfred

de Fuisseaux, a prominent agitator for universal suffrage, was condemned at Brussels to one year's imprisonment for having, in a pamphlet entitled "Le Catechisme du Peuple," denied the obligation of law, attacked the constitutional authority of the King, and insulted his person. The last-named prisoner escaped from the country. In July, seventeen men were convicted for burning the glass-works at Roux in March, and sentenced, two to imprisonment for life, two for fifteen years, three for ten years, and the rest for shorter terms. On Aug. 10, Wagener and Rutters were sentenced to five years' imprisonment for instigating the rioting at Liège. The Supreme Court, however, quashed their sentences, though it rejected the appeal of Schmidt and Failleur, two workmen who were condemned to twenty years' penal servitude for pillage and incendiarism at Baudoux.

On April 25, a workmen's congress, attended by 500 delegates, from 104 affiliated societies, met at Ghent, and resolved that a demonstration in favor of universal suffrage should take place at Brussels on June 13. The parade, in which from 80,000 to 100,000 workingmen were to take part, was prohibited by the burgomaster. The Socialists then determined to have a demonstration in all the towns of South Brabant, or, if they were forbidden, to call a grand congress at Brussels. The provincial demonstrations were prohibited; so, on June 13, a congress of 4,500 delegates met in Brussels to discuss the action of the authorities in forbidding demonstrations in favor of universal suffrage, although monster parades on the school question had been permitted in 1884, and to consider other urgent questions. It was resolved to address a manifesto to the nation, to contest all elections, and to create co-operative societies everywhere. Such societies were already in successful operation in the Ghent district, founded through the efforts of Anseele, the young Socialist leader, who had just been condemned to imprisonment for a press offense, and who now presided over the congress. Three resolutions were adopted by acclamation: (1) The agitation in favor of universal suffrage is to be continued; (2) a general strike to be begun as soon as the Workingmen's party has acquired sufficient strength; (3) to organize a fresh monster demonstration on August 15, the date of the national holiday at Brussels. The workingmen's procession, in Brussels, took place, without hindrance from the authorities, on August 15. There were 2,300 workmen from Ghent; 660 from Liège; 4,000 from other collieries; and in all, 30,000, who paraded the streets in an orderly manner for four hours. The authorities had forbidden cries or inscriptions for the republic, but permitted the red flag. The placards demanded universal suffrage and an amnesty for those who had been condemned on account of the disturbances in March. A commission was appointed to investigate the con-

dition of the working-classes, which, in its report, established the reality of many of the grievances of which the work-people complained. In Liége and other industrial centers it was found, for instance, that employers compelled the laborers to purchase supplies from their "truck" stores, at prices from 50 to 90 per cent above the usual retail rates.

The commission to inquire into the condition of industry included leading men of both parties, such as Senators Malou, Balisaux, and Montefiore; Deputies Levi, Buls, D'Andrimont, Jacobs, Meens, Pirmez, Sabatier, and Saintelette; economists, such as Profs. E. de Lavelye and Hector Denis, and MM. de Molinari and De Hauteville, but contained no representative of the working-class.

At the opening of the Chambers, on November 9, King Leopold, in the speech from the throne, announced that the Government would submit bills favoring the free formation of professional bodies to establish between workmen and employers bonds of union, in the way of conciliation and arbitration councils; to regulate the labor of women and children; to repress abuses in the payment of wages; to facilitate the construction of proper dwellings for laborers; to develop insurance institutions for the sick and helpless; to check intemperance and immorality; and to suppress adulteration in articles of food. The address also held out the promise of amnesty for those convicted of offenses connected with the March disturbances.

The School Question.—Dr. Ronvaux, the deputy burgomaster and superintendent of the communal schools in Namur, at a congress of school-teachers held in that town, delivered a toast to the King, in which he said that the school-masters and mistresses, who were doomed to martyrdom by the new school-laws, and who were more patriotic than the ministers that surrounded him, greeted their sovereign just as the gladiators about to die in the arena were wont to salute the Roman Cæsars. For this speech, on the ground that it was insulting to the King, the ministry removed the orator from his offices, and thereby roused the indignation of the Liberals throughout the country. This incident and the labor disturbances divided the attention of the public. An attempt was made to unite the different factions of the Liberal party on the old question of secular education, and prepare for the return of the old party leaders to power by electing Ronvaux as a representative from Brussels, to succeed Vandersmissen, who had brought disgrace on his party by killing his wife out of jealousy, and was on trial for homicide. The radical advocates of universal suffrage, however, refused to reunite with the moderate Liberals, and placed their own candidate in the field.

BEUST, Count Friedrich Ferdinand, Austrian statesman, born in Dresden in 1809; died at his country residence at Altenburg, near Vi-

enna, Oct. 24, 1886, of apoplexy. He was descended from an old Brandenburg family, and entered the diplomatic service of Saxony in 1831. After filling various high posts, among them that of minister to London, he became Saxon Prime Minister, holding the portfolio of Foreign Affairs, in 1849. During the reactionary period following the Revolution of 1848, Baron Beust, by severe repressive measures, presented himself to the Liberals of Saxony as the head of the Conservative reaction, though his own instincts were always liberal. He used coercion only as a temporary expedient that he considered necessary, and after the accession of King Johann, in 1854, adopted a liberal policy. During the ten years preceding the Austro-German War he and Count Bismarck were the leading exponents of two rival policies in Germany. While Bismarck was working for the predominance of Prussia, and the economical and political consolidation of the German states under her lead, Beust endeavored to bring about a league of the smaller states strong enough to resist either Austrian or Prussian domination. After the defeat of the Austrian army in 1866, the Emperor of Austria called to Vienna the great antagonist of the German Chancellor, and placed him at the head of the ministry, in order that his statesmanship and diplomatic address, for which he had a reputation throughout Europe, transcending that of any Austrian or of any German statesman except Bismarck, might find a way to avert the threatened dissolution of the Hapsburg monarchy. His conferences with Deak, in 1867, convinced him that there was no means of keeping Hungary within the empire except by granting her complete legislative independence in her domestic affairs. He evolved a radical and far-reaching plan, and carried it out with surprising rapidity and completeness. The dualistic system, of which he is generally accounted the originator, was proposed and advocated by him as a necessary compromise. This change in the Constitution of the empire was followed by changes not less thorough-going in the political system of Austria. Parliamentary and responsible government, and a transfer of political power, were accomplished so thoroughly that, although the royal prerogative has regained its ascendancy amid the conflicts that have arisen later, the aristocracy and the clergy, whom Beust mortally offended, have not recovered the powers and privileges that were curtailed under the Liberal *régime*. Count Beust's fixed aversion to Prussian predominance in Germany, sharpened by personal animosity toward the successful rival who had defeated his dearest plans, brought about his fall, and left others to cope with new combinations and new forces in the dual empire, that have altered the system that he created. In 1870 he endeavored to bring about an alliance of Austria with France against Germany; but the Hungarians, under the lead of Count Andrassy, defeated

this scheme. In 1871 he resigned the post of Chancellor. He was sent as ambassador to London and afterward to Paris, but attempted to take no further leading part in political affairs, and soon retired into private life. In his villa at Altenburg he amused himself with literary and artistic occupations, for which he had early developed a taste. In the beginning of his career he had composed a collection of "Musical Trifles," and written a book of songs, besides other poems, and after his retirement he occasionally published a reflective poem. He also wrote comprehensive "Memoirs" of his life and political activity, explaining and defending the ideas that he had striven to carry out, in the future realization of which he still believed.

BIRDS, SONGS OF. Birds are the only creatures that share with man the faculty of expressing fine shades of feeling by the voice. There are no dumb birds, and those that do not sing still have some of the tones that form the language of birds, such as notes of warning, cries of distress, calls to mate and young, and sounds that render emotions both defiant and peaceful, and are heard in their strifes and in their amours. Most naturalists regard the song of birds as a manifestation of the tender passion, and as an accompaniment of nidification and incubation. While this view may be in the main correct, it must be borne in mind that birds have an inherent aptitude for song and take delight in the exercise of this natural gift, and in caged birds there is a spontaneous overflow of energy in the use of this faculty the year round.

That such minute creatures as many of the best singing-birds should have such continuity and volume of voice is a phenomenon that can not be explained in a completely satisfactory way, though the powerful mechanism of song is to be accounted for in a measure on anatomical grounds. In the first place, singing-birds have a double larynx, one at the top and the other at the lower part of the trachea, and it is the latter that is especially active in the production of voice. This broncho-tracheal larynx (or syrinx, as it is technically called) varies somewhat in structure in different species of birds; but the voice-production is mainly on the principle of a reed instrument. The pitch of the note depends on the tension of the syringual membranes by muscles that are numerous and powerful relatively, and also on the length of the tracheal column of air. The timbre of the tones depends on the harmonic overtones, and the sounds are modified by lingual and pharyngeal movements. The immense variety of tones is due also to the rotary and lateral movements of the vocal apparatus (syrinx), effected by several pairs of muscles, which regulate the tension of a fine membrane that acts something like the reed in a clarinet. The amazing continuousness of the song is explained by the reserve supplies of air, as well as by the economical use of breath. Birds have air-sacs in the neck, chest, and abdomen—nine in all—

which communicate with the bronchial tubes, and even the feathers and bones contain air. The tracheal rings are complete, numerous, strong, and very elastic. The world-renowned philomel has a trachea only about one inch and a half long, which would not admit the passage of anything larger than an ordinary knitting-needle, and yet from this little tube issue those clear and penetrating tones which can be heard on a still night for nearly a mile. Still, with all these anatomical facts in view, whoever has listened to the unbroken tumult of notes of the nightingale in full song in his native bower, must have realized that there is something yet to be learned in instrumental acoustics.

The comparative merit of a bird's vocal performances depends on the following points: compass, variety, continuity, volume and quality of tone, including purity, gayness, plaintiveness, and general power of execution. The skylark, for instance, has a relatively small compass of voice, and often fails in purity of tone; but within its limited range it has almost incomparable power of execution, and possesses a variety of combinations of notes and a gayety of song seldom equaled. The Virginia cardinal has a mellow quality of tone which is surpassed only by the richest voices; but it has such a limited variety of notes that it can only be assigned an inferior rank as a songster. The American wood-thrush, although it possesses but a small variety of notes, has a quality of tone that is so highly musical as to place it among the finest singers.

It is a rule, with few exceptions, that large birds do not sing, and that the famous songsters are not only small but have plain plumage. Nature seems to have bestowed on the male bird exclusively powers of song as well as finer plumage. Occasionally a female essays the musical rôle of the male, but always with inferior success. In rare instances a female will persist in her newly assumed rôle, and by dint of practice attain to something like the song of the male. In general it may be said that the young bird inherits an aptitude for song from its father. It pays attention to him, to the exclusion of the notes of all other birds, and it learns its lesson with astonishing rapidity, so that if it be separated from its parent a few weeks after it is hatched, it still retains and at some future time faithfully repeats the song that it heard while a nestling. So largely is this an imitative performance, however, that if the nestling be allowed to hear only the song of another bird instead of that of its parent, it will learn a song foreign to its species, and in some cases will even repeat with fidelity the tune of a bird-organ instead of the native lay of its kind.

The song of birds is never a gift outright, but is gradually developed and finally perfected by long and patient practice. The first essays of the young bird are very imperfect, but it perseveres until it can render the paternal strains with full effect. The song is again lost during

the annual molt, and has to be reacquired with efforts that are not always apparent, for the bird practices in an undertone until it can again venture on a full-voiced performance. The song of the same bird changes also with the climate, locality, and season of the year, and reaches its full richness in spring-time. It also changes from year to year, and gradually improves under favorable conditions until the bird has reached the maximum development of its muscular and nervous system, and even then it may be developed still further in birds which have special powers of imitation. Most singing-birds have some faculty of imitation of the notes of other songsters, though it is confined chiefly to the notes of their own species, so that the general character of the song is preserved from generation to generation. There is a remarkable difference in the extent and quality of the song among individual birds of the same species, for though they may all belong to a singing family, it by no means follows that they will all have talent, and it even happens that, of two birds out of the same nest, one will greatly excel and the other will prove mediocre in song. In general, birds that have fully formed their song do not imitate much except through rivalry on special occasions. The analysis of the song of particular birds which is here given is based on a study of their notes in a native as well as in a captive state, and many of the tones here described are only to be heard as the reward of nearer acquaintance of the songsters in their wild haunts.

The Nightingale (*Luscinia philomela*).—The nightingale is the king of songsters, and its song presents difficulties of analysis, for it is both rapid and intricate. This rapidity of execution is a striking feature and it can be safely said not only that no other bird, but not even the skilled hand of man applied to a musical instrument, can produce in single succession, in a minute more notes than are poured forth from the throat of this wonderful little creature. The volume and compass of its voice are equally remarkable in view of the fact that it is not much larger than an English sparrow. Its loudest tones can be heard as far as those of the human voice. The anatomical reason for this is the unusually powerful development of the syringeal muscles, which in two specimens that the writer dissected were found to be especially well adapted for the production of tension of the true vocal membranes of the syrinx. One who has the rare opportunity to study and record the notes of a nightingale in full song will find that they number from twenty to thirty, and that these original and distinct tones are differently arranged and rearranged so as to give an almost endless variety. There is no regular round of song, as with many other birds, but changes and surprises follow at every turn, so that the most familiar ear can not anticipate that which is to come, although the separate notes of which all the performances consist may be recognized.

In other words, the nightingale's musical performances are real improvisations. The actual range of the voice is about two and a half octaves, and its flexibility is most remarkable throughout this range. The only effort is not in transition but apparently in the repression of its voluminous notes. As regards the retention and use of its breath and the phrasing of its passages, no artist could be more successful. Long strains follow one another without interruption of sound, and a whole minute may elapse without any perceptible break in the melody. Its most striking effects are attained in its staccato passages, which display such power of attack, such brilliancy and rapidity, as to merit the figurative description of vocal pyrotechnics. They are explosive sounds, and can not fail to excite agreeable surprise. Another of its notable feats is its crescendo, which sometimes consists in a very gradual increase in strength and fullness of song throughout long passages, but it is more frequently the rapid swelling of a single long note which during four or five repetitions passes from the smallest to the greatest volume of tone that the bird commands.

The timbre of the nightingale's voice is so peculiar that it can readily be distinguished from that of all other birds, and its chief characteristics are mellowness and brilliancy. The tones of birds are probably modified in a certain measure by sounds in surrounding nature. The nightingale is wont to frequent small running streams, and the liquid and purring quality of its tones would seem to be but an echo of one of the constant natural sounds of its haunts. But it seems to take pleasure in an occasional strong contrast produced by harsh notes suddenly interjected in the midst of its musical volleys. These rough sounds resemble somewhat the crinkling of stiff paper, or even the grating of pebbles when rubbed against one another. The nightingale seldom deigns to imitate other birds, although it has great ability in this way. When challenged by one of its kind in song, it will seize upon the finest passage of its rival and reproduce it with still finer execution. It shows great emulation even in caged life, and the writer has known it to out-sing and silence both the gay lark and the game mocking-bird, and when in full song it absolutely refuses to yield its place of first singer in the feathered choir.

The following are the principal notes of the nightingale's song:

1. A long sound like *tiou-tion*, distinctly articulated in different keys, and with increasing loudness several times in succession, and usually on a rising scale, is a characteristic note, which at times has such a plaintive tone as to justify the term "melancholy," which the poets have often applied to this part of the song.

2. The scale is a long series of notes, which rise or fall through the whole compass of the voice with astonishing power and rapidity.

8. The chopping-note is a low-pitched and abrupt note, sounding like *chop, chop*, uttered several times in quick succession, and is intermediate in quality between the truly musical and the simply noisy tones of the nightingale.

4. The needle-note is the most acute of all the bird's tones, and is seemingly produced during inspiration. The finest cambric needle would be coarse compared with the delicate thread of this long-drawn sound, which is so acute at times as to be scarcely audible; and as it is often broadened to the average volume of tone again with a swift descent, the effect is most brilliant.

5. The gnarl is another characteristic note of the nightingale, and may be compared to the sound of a knotted string drawn rapidly through a small aperture in a thin sounding-board. The gnarled notes are always quick and forcible, most commonly given on a rising scale, and form one of the striking contrasts in song in which the bird delights, and are often immediately followed by the sweetest tones.

6. The water-notes are delightful, liquid, purling sounds, interspersed at frequent intervals throughout the performance. These water-notes are unequaled even by the finest tones of this kind known to be produced by the most cultivated canary songsters. The nearest approach is the water-roll of St. Andreasberg canaries, which has been developed for so many generations by bird-fanciers, by careful selection, and by furnishing nightingales as instructors for the canaries.

7. The continuous roll is possessed almost exclusively by the canary, and the nightingale is one of the very few birds that share to some degree the faculty of rolling at any pitch of the voice uninterruptedly.

8. The flute-notes are long, sweet tones, which have rare purity and a most charming effect, and are repeated at all points of the compass of the voice.

9. The rattle is a note in which philomel especially delights. It is confined to the lower range of the voice, and consists of a prolonged rattle, which at the same time has a liquid sound, as if small, hard substances were shaken in a vessel containing liquid. Some nightingales make much use of this musical rattle as a sort of accompaniment to their higher notes.

Any account of the song of the nightingale would be incomplete without some reference to that of a larger species of the bird, found chiefly in eastern Europe, and much fancied by connoisseurs. The bird referred to is *Luscinia major*, and it is about a third larger than the common nightingale, of much stouter build, and it is slightly mottled on the breast. The larger bird has not the same remarkable variety of notes as the smaller one; but it has louder and longer tones of equal purity and expression, and even more wonderful talent in the modulation of its song. Its long, quivering tones are so rich and full of pathos, that they are sure to captivate the listener, who will

also be astonished at the deliberation and perfect command of voice with which the various inflections of the song are rendered. At the height of its song its artful modulations and distinct phrases approach in character to musical compositions. The nightingale has been compared to the violin, and the larger species to the violoncello, which has qualities like the human voice; and it has been said that, while other birds whistle, *Luscinia major* alone sings. This study of the song of the nightingale, although more complete than any that the writer has been able to find, does not by any means exhaust all the tones or describe all the notes of this entertaining bird.

The Canary (*Carduelis canaria*).—The canary, of all caged birds, is the most universally known and liked. The Germans have given great care to the breeding of this universal pet, and they supply most of the markets of the world with the finest birds from the Harz Mountains, and more especially from St. Andreasburg, which is celebrated for its educated canaries, which are never allowed to hear any but the best singers of their own kind, and are also kept near such artistic performers as larks and nightingales, so that they acquire occasional notes from them, in addition to the parent-song. The canary has a great faculty for imitation when young, but, after it has matured fully in one manner of voice and song, it seldom changes. If removed from the nest before it has heard the parent-song, and raised alongside of some other singing-bird, it will often sing the foreign notes, or it will even learn to pipe a tune from a bird-organ, and the writer has heard one thus educated pipe an operatic air to the complete exclusion of its own song. In fact, the ordinary song of the bird retains but few of the notes of the original canary from the Canary Islands. An analysis of the song of the canary shows that the original notes, or distinctly separate tones of which it is composed, number from ten to twenty. Few birds have all these distinct notes, and those that have a dozen separate tones are considered to possess a full song. The canary does not improvise or change its song, but as a rule it repeats the same notes in the same order. This round of song may be slightly changed from one season to another; but this is the exception, and it is very rare that a new note is added after the first year. The following are the principal notes of the canary's song:

1. The roll is the most characteristic of all the canary-notes. No other bird is known to possess this roll in such perfection as the canary; and, of the myriad songsters of the great forests, those that have any use of this note can be counted on the fingers of one hand. This even and continuous roll is as perfect as the trill of any instrument, and can be produced at any pitch within the range of the voice. The same bird often gives it pitched in five or six different ways, with pleasing swell and modu-

lation; in certain St. Andreasburg canaries it has been cultivated almost to the exclusion of other strains, and in most canaries it forms the burden of the song.

2. The flute-notes are long, clear, piping tones, of flute-like quality, usually repeated several times in immediate succession. The finest of these tones have been acquired from the nightingale, but they are more acute, and by no means as full as the original model tones, of which they are imitations.

3. The water-notes are liquid and bubbling tones, in the form of a trill. The bird-fancier considers the water-roll one of the finest notes of a good singer. Only occasionally is a canary found having this note well developed, and it then adds a novel attraction to the song.

4. The most perfect of the bell-notes are almost a complete deception to the ear, so much do they resemble the tinkling of small bells. The birds that have the bell-notes well formed are greatly prized in St. Andreasburg, command a high price, and are seldom brought to this country. The *Procnias carunculata*, of Brazil, and the *Myzantha melanophrys* of Australia, have natural bell-tones; but in the canary these notes are acquired in some way of which the writer has never been able to gain any account. The only member of the feathered tribe that could have served as an instructor to so little a bird as the canary, is a very small South American bird, having perfect bell-notes; but it very soon dies in captivity. The canary, then, though somewhat automatic and imitative in its song, and devoid of originality, is still to be numbered among the foremost songsters.

The Mocking-Bird (*Mimus polyglottus*).—The mocking-bird is accredited with greater musical gifts than any bird of the new continent, and even so good an authority as Audubon inclines to the belief that it surpasses all other birds in powers of execution, the nightingale not excepted. The natural tones of the mocking-bird are similar to those of large numbers of the thrush tribe, and though numerous they do not compare with the variety of its acquired notes. The bird has well earned its name by a remarkable display of mimetic talent, and there are few birds of the American forest that it can not imitate with some measure of success. Its superiority in song depends, first, on a remarkable compass of voice of about three octaves; and, secondly, on prodigious strength and flexibility of voice. It would be a mistake to suppose that every mocking-bird adopts with readiness the song of other birds. The foreign notes are partly inherited, and the richness of song is thus a gradual acquisition, and the portion of the common store of notes immediately pilfered from other birds is relatively small. In captivity the mocking-bird does not often avail himself of the opportunity to acquire the song of other birds, and it is only an occasional specimen that shows special cleverness in this way, and most of them sing

the paternal lay the last year of their lives just as they sang it the first year.

If the mocking-bird had not glaring defects as well as great merits, he might well challenge the right of philomel to the title of king. The mocking-bird is unsurpassed in compass of voice, in richness of tone, and in facility of execution; but he offends all ideas of musical sequence in his reckless medley, and interrupts his flow of melody by the most startling cacophony. An attentive listener, if familiar with the notes of American songsters, will readily distinguish the bird's original strains from its imitations, for the latter retain the mocking-bird timbre, however faithfully they may render the borrowed rhythm and inflection of tones. The mocking-bird, as a rule, intersperses the imitations throughout its song; but occasionally it seems to delight in unburdening itself of its stolen stores all at once, and then may be heard in direct and quick succession some of the notes of the robin, cat-bird, blue-jay, oriole, Virginia cardinal, quail, and brown thrasher, and this amusing medley may finally terminate with the discordant shriek of the night-hawk. Harsh tones are retained and repeated with the same apparent pleasure as musical ones, and the barn-yard fowl is as likely to be an object of imitation as the most melodious songster. At night in his native bower, when no longer diverted by many sounds, and when the moon sheds an even, silver light, the mocking-bird discourses his own sweet music in rapturous lays. In general, however, the song abounds in strong contrasts, and he pours forth a volley of tones that are high and low, long and short, smooth and rough, soft and loud, and grave and gay by turns; and with every shake of his musical throat he surprises the ear with some new combination. The performances, like those of the nightingale, are extemporized under the inspiration of the moment, and they change with the occasion. Different birds vary greatly in their attainments. There are very indifferent singers, and there are others that have more than forty distinct notes, including both natural and acquired, and these notes are blended and interwoven in an endless number of ways in song. It is extremely difficult to separate the song of the mocking-bird into its component parts and describe them in words. The following analysis has reference more especially to the native song which is common to the whole species: The voice, as already said, comprises about three octaves, and over this entire range the facility of performance seems to be equally great. Both the major and minor keys can be detected, but more especially the latter, and occasionally a musical interval is struck even in the wild song. Distinct musical intervals are rare among birds, and the cuckoo affords a good instance of notes pitched on an interval. The following are the chief strains:

1. The scale is always a rapid rising or falling series of tones of equal length which may

extend over the range of an octave. It is accidental if some of the tones correspond now and then with our natural or chromatic scale, for they are quarter-notes or perhaps still smaller fractional divisions of whole notes of the diatonic scale. The tones are struck off with great force and rapidity, for it is one of the bird's bravura passages.

2. The trill as produced by the canary and the nightingale is not a part of the *répertoire* of the mocking-bird. He has instead, however, a magnificent shake which he can command at any pitch of his voice, and which is unequalled even by that of the blackcap.

3. The piping tones are of varied altitude, volume, and timbre. In the main they correspond to the flute-notes of the nightingale, but they resemble more nearly certain clarionet-tones. They are very fine notes, and as smooth as the whistle of the blackbird or the mellow pipe of the Virginia cardinal.

4. The canary-tones are sometimes mistaken for imitations of the canary, but are true mocking-bird notes. They are very delicate and acute sounds, more thread-like often than the finest canary-tones, and coming from so large a bird they both surprise and amuse.

5. The gutturals are forcible and rough tones, which form a rude setting for the more brilliant parts of the bird's song. They have been compared to the rubbing together of bits of sand-paper or to the sound of a grindstone in use, and, like other native tones, they have been mistaken for imitations, being likened in this instance to the creaking of a rusty hinge. They correspond to the rattle of the nightingale, but have not the same musical character.

6. Almost all the inflected tones are preceded by a brief series of notes, which are short, rapid, and pitched generally lower than those to which they serve as a prelude. The series contains from three to twelve notes, and is followed by a long, modulated tone which completes the phrase, and in turn is followed by a very perceptible pause. Another series of short, rapid notes and then a long inflection, and again a pause occurs; and in this manner a great part of all the singing is conducted. Unfortunately, the phrases are so short and the pauses so distinct as to rob the song of that continuous nature which is so impressive in the nightingale's performances.

7. The modulated tones constitute the chief charm of the mocking-bird's song. They are prolonged intonations expressing every musical conceit and every shade of feeling of which the bird is capable, and they extend throughout the compass of his voice and display every quality of his vocal organ. They are by turns plaintive and gay, serious and comic, defiant and caressing, and are so free from effort and so spontaneous that they strike the hearer with wonder and admiration. In the combination of a given number of notes the nightingale has more ingenuity, but in the modulation of single tones the mocking-bird has unequalled tact.

Finally, in assigning to the mocking-bird his just rank among song-birds it must be considered that his musical style is broad, and his taste almost universal. He takes the whole of nature for his song-book, and borrows not alone from the birds of the air; the rippling stream, the rustling leaves, the sighing wind, and all sounding things, animate or inanimate, yield him inspiration.

The Skylark (*Alauda arvensis*).—Numberless poetic lines have been written about this “minstrel of the sky,” and literary favors have been about equally lavished upon him and the nightingale. The two birds differ totally as to the time, place, and manner of their song. One prefers the dimness of the night, and the other the full blaze of the noon tide sun; one seeks the closest shade, and the other the open expanse of the skies; one sings while perfectly still, and the other while in rapid flight toward the sun; one is the most pathetic of songsters, and the other is the most joyous of warblers. The skylark is by nature both bold and gay, and in his native fields he fights and sings the live-long day. His music is as sprightly as an Irish jig or a Scottish hornpipe, and he dashes along at such a rate that it is almost impossible to follow the quick windings of his song. The air seems to be full of musical vibrations, and it sounds at times like two or three birds singing together, and distantly reminds one of a bagpipe with chanter and drones in full blast. There is a pleasing, low, humming sound, which serves as an accompaniment, to his beautiful high tones, and his rippling song is only broken by an occasional brief pause. It is not difficult to understand the great popularity of the skylark, for he has two most delightful qualities—sprightliness and variety. A careful study of his vocal performances leads to several unexpected and interesting conclusions. In the first place, the seeming maze of his musical sounds can be reduced to a few fundamental tones; secondly, the range of his voice, which one would suppose very great, judging from his success in song, is found to be relatively very limited; and, finally, the whole genius of the bird and the secret of his musical superiority may be described as an incomparable faculty of composing much out of little—the ability to combine a few notes into an endless variety of musical phrases. Four fifths of all his singing is done within the narrow limits of three or four notes of the diatonic scale, and it is a question whether the utmost range of his voice is not included within a single octave. All these facts are obscured by the rapidity and variety of his combinations of notes, and popularly he is ranked as second only to the nightingale in song. The principal component tones of the skylark's song are as follow:

1. The continuous warble is the strain most constantly heard, and has a superficial resemblance to the roll of the canary, but it is radically different in its formation. It is neither a

thrill (i. e., the even alternation of two contiguous notes) nor a tremulo. It is the rising and falling sequence of fractional notes, which are probably less than quarter-tones, and which on this account, and also owing to their extreme rapidity, impart a vague character to this part of the song, so that the notes can not be followed by the ear *seriatim* as in those portions having tones of longer intervals.

2. The cantabile notes are long-sustained and delightfully inflected tones, which have a true singing character. Few birds are capable of sounds of such a song-like nature. These notes are so rich that they impart to the song, which without them, would occupy a secondary rank, a musical value much like that accorded to the performances of the nightingale and mocking-bird.

3. Finally, to sum up the musical gifts of the skylark, it may be said that he has the sprightliness of song of the goldfinch, the merry jingle of notes of the bobolink, a genius for combination of tones possessed by none but master-songsters, and a song-like timbre of voice that is unique.

The accompanying illustrations of the vocal apparatus of singing-birds are from dissections made by the writer, and are of life-size. Fig. 1 represents the vocal organs of the Virginia nightingale, as it is popularly called,

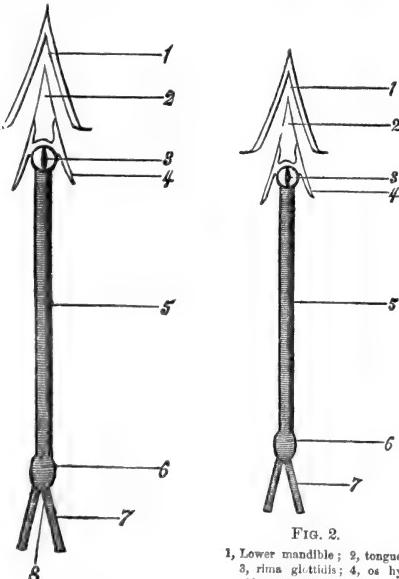

FIG. 1.

1, Lower mandible; 2, tongue; 3, rima glottidis; 4, os hyoides; 5, trachea; 6, syrinx; 7, bronchia.

though it is known to the naturalist as *Cardinalis Virginianus*. It is a very handsome bird, about the size of the robin, with scarlet plumage and crest and a red beak, and it has a fine, mellow voice. The figure gives a posterior view, with all the surrounding parts re-

moved except the lower part of the bill with the tongue and its attachments. The bronchi open into the lower larynx (syrinx) separately, thus forming two glottides, and the vocal membranes are elastic reduplications of the lining bronchial membranes. There is a thin partition of the syrinx into equal halves by a septum which is cartilaginous in the cardinal—in the canary and in the linnet, although in larger birds it is bony and forms the cross-bone (pessulus). Extending from this pessulus downward on the inner side of each bronchus in larger birds is a distinct membrane (*membrana tympaniformis interna*) which, through tension and relaxation, serves to modify the vocal sounds. This membrane is merely rudimentary in the figures here given, and the bronchial rings are not completed by membrane as in some other instances. The trachea in the birds here described is composed of about fifty rings complete and very elastic, and both the tracheal and bronchi are capable of considerable increase in length by muscular effort on the part of the bird. There are no vocal cords in the upper larynx, which has an opening (*rima glottidis*) controlled by a pair of muscles.

Fig. 2 presents a similar life-sized view of the vocal organs of the canary-bird. The cross-bone in the syrinx in young birds at least appears to be little more than a cartilaginous septum, and the tracheal rings are still distinct and about fifty in number, and the bronchial rings, likewise, are apparently complete, and there is no visible tympaniform membrane. In other respects the parts are the same as in Fig. 1, and the numbers correspond in both figures.

BOLIVIA, an independent republic of South America, area 772,648 square miles. The aggregate population numbers about 2,250,000, and is composed largely of the Quichua and Aymará Indians, the former being direct descendants of the Incas. Their proportionate division is, Quichuas, 50 per cent.; Aymarás, 25 per cent.; cholos, a Spanish and Indian mixture, 18 per cent.; and half-castes, 7 per cent. This strange and interesting race lives in villages called *comunidades*, under a governor, or alcalde, who is one of their number. They pay a tribute of from four to ten Bolivian dollars a year, those of age who can read and write being exempt from payment, and admitted to the ballot.

Travel in Bolivia is comparatively safe, for the Indians are not dangerous, and, though the last trace of malice toward the Spanish race has not entirely disappeared, they are grave and deferential to *caballeros*.

Government.—The President of the Republic is Don Gregorio Pacheco. His Cabinet is composed of the following ministers: Foreign Relations, Dr. Jorge Oblitas; Justice, Public Worship, and Instruction, Don Martin Lanza; Finance, Señor H. Gutierrez; Interior, Dr. M. M. Dilledina; War, Col. Severo Zapata.

The Bolivian Minister at Washington is Don Casimiro Corral. The Bolivian Consul-General at New York is Don Melchor Abarro; the Consul at New Orleans, Señor J. P. Macheca; at San Francisco, Señor F. Herrera. The American Minister Resident and Consul-General at Sucre is the Hon. W. D. Bloxham, and the Consul at La Paz, S. Alexander.

Army.—The strength of the Bolivian army, including 1,021 officers of all ranks, is 3,021.

Finances.—The national indebtedness amounts to \$10,000,000. The income of the nation in 1884 was \$2,344,796; in 1885, \$2,990,139; increase in a single year, \$645,343. There was established in 1886, at La Paz, a bank on shares, with a cash capital of \$500,000, called the Banco Potosí.

Railroads.—A railroad is projected to connect the Argentine frontier, near the town of Quiaca, with the Bolivian city of Potosí. It will run along the right bank of Paraná river to the port of Barranquera. Chili is also actively pushing work on the railroad that extends from Antofagasta into the interior. It had reached, in 1886, beyond Calama as far as Anil, and was rapidly approaching La Poruña, opposite Santa Bárbara. Trains were arriving within two miles of the river Loa, where an iron and a wooden bridge were to be built.

Telegraphs.—There were in operation in 1886 the following stations connecting with the Argentine system: Cotagaita, Huambaca, Potosí, Sucre or Chuquisaca, La Paz, and Tupiza. Communication with La Paz may also be had *via* Mollendo. The total length of lines was about 400 miles.

A Landlocked Republic.—The result of the war on the Pacific deprived Bolivia of coast and seaports, and likewise of the great wealth of nitrate and guano in the districts of Cobija and Tarapacá. The exact course of a portion of her southern limit, separating Bolivia from the Argentine Republic, has been for some time undetermined; hence the main outlets for Bolivian trade are through Chilian, Peruvian, and Argentine territory. The most accessible port of the former is Arica, which involves a tedious land-transit of 240 miles from La Paz to Tacna, which is in railroad connection with Arica, a distance of forty miles. The traffic over this route, however, has of late years become reduced to the transportation of a portion of the mining products from the department of Oruro, and to the mule-post from La Paz to Tacna, regularly performed in five days, while the great bulk of trade from the La Paz district is by steamer across Lake Titicaca and Peru, and *via* the Puno-Arequipa Railroad to Mollendo. The third and longer route is south-westerly through the Argentine Republic to Buenos Ayres, and, in pursuance of a treaty whereby Bolivia reduces the import duty 50 per cent. on goods coming from the Atlantic against the Argentine Republic, granting gratuitous right of egress through her territory, the larger part of the productions of the de-

partments of Potosí, Chuquisaca, and Tarijá, consisting almost entirely of minerals and metals, is drained through the Argentine Republic in preference to Chili. This shifting of trade from the Pacific to the Atlantic, and the consequent decrease of business on the former coast, promoted, in a large measure, by political spite, has been felt so keenly that a new impetus is imparted to the project of putting La Paz in railroad connection with the coast, the line running through Oruro to Tacna, thereby recovering and controlling the entire trade from the Pacific side.

Cinchona - Bark.—The most important pursuit in the tropical or lowland districts, which has developed into a permanent industry, is the cutting and exportation of cinchona-bark, the richest in quinine. But the most accessible trees having become exhausted, the bark is no longer derived from the forests, and the business has become a systematic, scientific cultivation. The credit of bringing this nursery culture to a high degree of perfection is largely due to Otto Richter, who, besides being otherwise largely interested in Bolivia, is the leading bark-merchant, his four *haciendas* or *quinalas* in the Mapiri district, having grown already more than two million trees. The bark business, however, has been very much depressed of late years, on account of the exceedingly low price to which quinine has fallen.

Coca.—Hardly of less importance are the coca-plantations from the leaves of which plants the mysterious cocaine is extracted. The great progress made in modern medicine in the use of this drug, not only in various medicinal forms, but also as an anaesthetic, has created a large demand for coca-leaves. The plant only flourishes in moist climates, and is seldom found in the deep valleys of the Andes. It is cultivated in rows like Indian corn, and after two years' growth the bush attains its full height of from five to six feet, bearing green leaves about two inches long, with white blossoms and red berries. The leaves are gathered several times a year, and dried in the sun with great care before being packed for exportation, the bushes produce for many years, when finally the planting of a fresh crop becomes necessary to preserve the good quality of the leaf. Besides its local use by the Indians, who masticate it with or without slackened lime, a tea is made from the plant, and the miners also chew the leaf constantly for its soothing effect. These sources of home consumption in themselves sustain many large plantation enterprises.

Silver.—The development of Bolivia's mineral resources is the most important of her national industries; for included in her prodigious mineral wealth (which numerous documents in European libraries prove to have influenced the political and monetary history not only of Spain, but of the entire commercial world), there are many gold, silver, copper, and tin ores, whose extraordinary richness gives a large profit in spite of the excessive freight

costs. The name and fabulous riches of Potosí are familiar. It was discovered in 1544, and the products up to 1572 amounted to \$250,000,000; from 1572 to 1627, to \$340,000,000; from the middle of the 17th to the 18th century the records of Potosí show an annual average production of from \$2,500,000 to \$3,500,000; and, according to data contained in letters written to the King of Spain in 1627, the compilations of Friar José G. de Acosta, and the annals of Potosí, the Cerro Rico de Potosí or Rich Silver Mountain, has produced, up to the present time, upward of £400,000,000 sterling of silver. Prior to 1825 the industry was erratic, and mining operations were frequently paralyzed by political troubles. Among the earliest interferences was the civil war in Spain in 1623. The war of independence in 1809, ending with the declaration of peace in 1825, caused another suspension in mining, and a general impoverishment of the country. Since the independence of the republic, however, mining enterprises have never been disturbed through political causes, and the irregularities occasioned by revolutionary movements have not extended to the mining regions or caused injury to corporations. On the contrary, the production of precious metals has never ceased to be encouraged and fostered, and, while miners are not required to pay taxes, the export duty is only one peso, or eight reals per mark (58 cents per 0.5065 pound avoirdupois), gold being free, and machinery imported for exploitation entirely exempt from taxation. The growth of Bolivia's leading industry, however, is seriously retarded for want of more roads, proximity to accessible seaports, timber, and a better fuel than *tagua* and *vareta* (lamadung and moss) in the silver-lode districts. But these disadvantages have been somewhat diminished, for, by means of the Mollendo-Arequipa - Puno Railroad, connecting with the steam navigation on Lake Titicaca, and the stage-roads from Chililaya (or Querto Perez) to La Paz, and thence to Corocoro and Oruro, an extensive mineral territory is made easier of access, while the steady advance of the railroad system, now extending westward in the Argentine Republic toward southern Bolivia, is greatly facilitating the reopening of the Potosí mining district, which has lately been undertaken by an Anglo-Bolivian company. The Huanchaca mine produced, in 1885, \$4,819,146 worth of silver-ores, netting the company for the year \$2,080,039.

Gold.—The gold of Bolivia is chiefly derived from placer-mines along the rivers coursing through the section of country embracing the eastern slopes and foot-hills of the La Paz Cordillera. Gold-mining is carried on in a primitive way by the natives.

The New Mining Laws.—At one of the late national conventions, the mining laws were carefully revised, and the new Spanish code substantially adopted, with the view of favoring the development of the industry and invit-

ing the investment of foreign capital. Among its fundamental provisions are:

On lands belonging to the public domain, and also on unfenced private property, minerals and mines may be sought, applied for, granted, and worked. Within fenced ground, the proprietor's permission or judicial license must be first obtained.

All individuals possessed of civil rights may apply for and obtain one or more *pertenencias* (one *pertenencia* = 100 m. square = 1 *hectárea*) in one concession, not, however, to exceed 30 *pertenencias* (or 30 *hectáreas*). The *pertenencias* constituting one concession may not be scattered, but must border on one another (having common side-lines), forming a right-angled polygon.

Priority of application has preference, however slight the difference in time.

Gold or tin deposits or other metallic minerals occurring in rivers, placers, pockets, irregular deposits, or bedded veins, on public or private lands, are subject to the same law applicable to all mineral concessions.

The claimant is owner of, and may work to an unlimited depth, all the ground, veins, deposits, and mineral occurrences, within his surface claim and within the vertical planes passed through all the surface boundary-lines of such claim.

The concessions are perpetual in duration as long as the yearly *patente* of five boliviarios (five Bolivian dollars) per *hectárea* is regularly paid.

In case of failure to pay the *patente* for a period of one year, the claimant forfeits his right, title, and interest in and to the claim; and his property is sold out at auction to the highest bidder, when the claimant receives the surplus, after the amount of his indebtedness, plus costs and plus 10 per cent. of the entire amount for which the property was sold are deducted.

New Projects.—With all the natural resources that should combine to make Bolivia an extraordinarily rich and prosperous country, it must be acknowledged that, with the exception of the calisaya-bark and coca plantations, and the operations of a few of the better regulated mining enterprises, everything is surprisingly backward. Each new administration has begun with strong endeavors to pursue a policy conducive to business activity. Liberal and numerous concessions have been granted for roads and other public improvements; yet, for the greater part, nothing but trails connect the cities, traveled by mules, llamas, and Indians. In 1868 a navigation company was formed, with a large concession from the Government, having as its object the opening up of a route down the rivers Mamoré and Madeira to the Atlantic. The scheme was promising, and would have given easy access to half a million square miles of valuable land in Bolivia and Brazil, traversed by immense rivers, forming a natural canal system possessed by no other country in the world. But up to the present time no active steps have been taken toward the realization of these designs, and the traffic in that direction, confined almost exclusively to the exportation of India-rubber and hides, is expensive and tedious. Another project is now discussed, to continue the navigation of Lake Titicaca through Rio Desaguadero to Lake Poopó, and by means of a new railroad line from Chililaya to La Paz, in substitution for the present stage-road, and

the navigation of other subordinate rivers farther south, to connect La Paz, Corocoro, Barca, Oruro, Cochabamba, Colquechaca, Sucre, and Huanchaca, with a view of diverting the Argentine-Atlantic and La Paz-Chilian trade northwestward through Bolivia and Peru to Mollendo. But it appears that certain engineering problems present obstacles to this scheme.

Commerce.—A better account of the trade of Bolivia may be found in the custom-houses of the neighboring countries than in her own. There has been no full custom-house report in Bolivia for three years; but from data derived from many sources, the total value of Bolivian exports in 1885 may be set down at \$9,745,000, and the total value of imports at \$6,820,000. The official report places the amount of duties collected during 1884 at \$618,765, and the amount up to June 30, 1885, at \$724,807.

The export of Bolivian products *via* Arica, in 1885, was as follows: to Valparaiso, 13,605 kilogrammes of calisaya-bark and 66,003 of quinine-bark; to England, 4,348 and 48,767, respectively; to France, 14,781 and 12,601; to Germany, 11,936 kilogrammes of quinine-bark; and to Peru, 70 kilogrammes of calisaya and 907 of quinine-bark. There were shipped to various countries 555 tons of ingot-copper, 515 tons tin in slabs, 46,509 kilogrammes bar-silver, 543 tons of silver-ore, and 796 tons of copper-ore. Bolivian trade with the United States is trifling. American goods are seldom met with in Bolivia. In 1883 the export to England amounted to \$1,730,637, and the import thence to \$322,778. With other countries, notably Germany and France, there is an active trade.

BRAZIL. For details relating to area, territorial divisions, population, etc., see "Annual Cyclopædia" for 1884.

Government.—The Emperor is Dom Pedro II, born Dec. 2, 1825; proclaimed April 7, 1831; regency until July 23, 1840; crowned July 18, 1841; married, Sept. 4, 1843, Theresa Christina Maria, daughter of the late King Francis I of the Two Sicilies. The Cabinet is composed of the following ministers: President of the Council and Minister of Foreign Affairs, Senator Baron de Cotelipe; Minister of Agriculture, Commerce, and Public Works, Representative Antonio da Silva Prado; Minister of Finance, Francisco Belizario Soares de Souza; Minister of the Interior, Senator Baron de Mamoré; Minister of Justice, Senator Joaquim Delphino Ribeiro da Luz; Minister of War, Representative Alfredo Rodrigues Fernandes Chaves; Secretary of the Navy, Dr. Samuel Wallace McDowell. The Council of State comprises, besides the Princess Imperial, Donna Yzabel, and Prince Gaston of Orléans, Count d'En, the following members extraordinary (limited to twelve): Senators Viscount de Muritiba, Viscount de Bom Retiro, Admiral Lamare, J. J. Teixeira, M. P. de Souza Dantes,

Viscount de Paranaguá, J. L. V. Cansansão de Sinimbi; Deputies Martin Francisco, Ribeiro de Andrade, P. J. Soarez de Souza, J. C. de Andrade Pinto, and Senators Affonso Celso de A. Figueiredo, J. B. da Cunha e Figueiredo, Lafayette Rodrigues Pereira, and L. A. Vieira da Silva.

The Brazilian Minister at Washington is Baron de Itajuba. The Consul-General of Brazil at New York is Dr. Salvador Mendonça. The United States Minister to Brazil is Hon. T. A. Osborn. The United States Consul-General at Rio de Janeiro is H. C. Armstrong, and the consul at Santos C. R. McCall.

Termination of Treaties.—The Brazilian Government has given the stipulated twelve months' notice to the Governments of Great Britain, Italy, France, Germany, Spain, Holland, and Switzerland, to terminate on Sept. 22, 1887, the consular treaties with those countries, and similar notice will be given to Belgium for termination on Sept. 4, 1888, and to Paraguay for termination on May 28, 1890. This action is understood to arise from the desire of the Government to get rid of consular intervention in regard to the property of absent and deceased persons.

Finances.—On Aug. 20, 1885, the national indebtedness stood as follows:

	Milreis.
Foreign debt	175,274,000
Funded home debt	888,199,900
Loan of 1868	22,047,000
Loan of 1879	42,668,000
Paper money	194,252,585
Advances made by a private capitalist	700,000
Total	826,156,455

On March 3, 1886, the floating debt had increased, through annual deficits, to 100,000,000 milreis, of which there were due the banks alone 86,000,000 milreis. The last two deficits had been: 1884-'85, 18,404,628; and 1885-'86, 21,702,636. In order to convert the floating debt and the 336,000,000 milreis 6 per cent. funded home debt into 5 per cent. bonds, a European 5 per cent. loan of £6,000,000 was made at 95, with 1 per cent. annually set aside toward the sinking fund. This proved a great success, the loan being subscribed to three times over. Simultaneously the Government placed with equal success on the home market a 50,000,000 milreis 5 per cent. loan at 95. The exchange on London soon rose from 17½d. the milreis to 22d. This occurred early in March. In May there were balances in the various departments aggregating the sum of 3,000,000 milreis; but to the remaining deficit there would have to be added 3,624,431 milreis for extraordinary expenses and special credits granted, thus raising the deficit to 4,607,532.

The public debt amounted to 57,000,000 milreis in 1840, to 178,000,000 in 1850, to 146,000,000 in 1860, to 522,000,000 in 1870, and to 802,000,000 in 1880. The President of the Budget Committee estimated the national indebtedness, including all floating debts, and calculating the loss of exchange on the foreign

debt, at 1,000,000,000 milreis on June 14, 1886, in his speech before the Chamber of Deputies. He remarked that the railroads alone cost the state 18,000,000 per annum; that he was not opposed to railways, but the Government ought to stop building them; and that it is a mistake to believe that all the lines are good investments. He alluded to the two new internal taxes proposed to be levied in future, the one on home-made alcoholic beverages, and the salt tax. The former, he remarked, is just, for it will protect genuine native wines against adulterated ones manufactured in the country, and the salt-tax the consumer will hardly feel.

The 2,000,000 milreis emancipation fund was distributed as follows:

	Milreis.		Milreis.
Pará.....	50,000	São Paulo.....	250,000
Maranhão.....	100,000	Paraná.....	13,000
Piauhy.....	80,000	Santa Catharina.....	15,000
Rio Grande do Norte.....	10,000	Rio Grande do Sul.....	100,000
Parahyba.....	40,000	Minas-Geraes.....	450,000
Pernambuco.....	130,000	Goyaz.....	10,000
Alagoas.....	40,000	Matto-Grosso.....	10,000
Sergipe.....	40,000	Município da Corte.....	115,000
Bahia.....	130,000	Total.....	2,000,000
Esprito Santo.....	20,000		
Rio de Janeiro.....	450,000		

The English Bank of Rio de Janeiro declared, for the second half of its business year ended June 30, a dividend of 5 per cent., making the total dividend declared for the six months 9 per cent. The Banco do Commercio, with a paid-in capital of 6,750,000 milreis, made a profit during the twelvemonth ended June 30 of 1,041,829 milreis, or 168,179 milreis more than in 1884-'85. The Banco Industrial e Mercantil made a profit of 1,120,456 milreis, being 2,257 milreis more than in 1884-'85.

At the meeting of shareholders of the Banco do Brazil, held at Rio on Sept. 21, 1886, the board of directors reported for the business year 1885-'86 a net profit of 7,442,271 milreis. The reserve fund was at the same time represented by the sum of 6,364,565 milreis, and profits held in suspense in the portfolio of mortgages 2,463,368, constituting a total thus held of 8,827,933 milreis.

Custom-House Storage.—There has been so much complaint on the part of importers at Rio about the excessively high storage rates, which were one half of 1 per cent. a month on the value of merchandise, that the Government proposes to adopt the ensuing rates instead: Up to two months, 0·5 per cent.; up to four months, 1 per cent.; up to six months, 1½ per cent.; and for a period exceeding six months, 2 per cent. a month.

Revenue Reforms.—The new taxes to be levied are to be 10 reis the litre on salt, and an excise of 50 reis the litre imposed on alcoholic beverages made and consumed in Brazil, with the exception of natural wines. The stamp-duties are to be revised. The Government is also empowered to revise the import tariff, altering the classifications and valuations and the rates on articles competing with those manufactured in Brazil, at the same time reducing the rate on articles employed as raw material by the

home manufacturers. The free list is to be curtailed, and, as the 5 per cent. sur-tax on all import duties levied since July 1, 1886, for the emancipation fund was to be turned over to general revenue, the 60 per cent. additional taxes or sur-taxes are to be incorporated with the duty rate, so that the present 10 per cent. class will become 16 per cent., the 20 per cent. 32 per cent., the 30 per cent. 48 per cent., and the 40 per cent. 64 per cent.

Commerce.—The following table exhibits the foreign trade of Brazil, expressed in milreis:

YEARS.	Imports.	Exports.
1881-'82.....	182,251,700	209,851,400
1882-'83.....	185,861,900	195,498,600
1883-'84.....	194,222,500	202,494,800
1884-'85.....	169,481,024	224,800,477
Average.....	182,941,776	208,021,819

The so-called trade balance for 1884-'85, it will be seen, shows a notable improvement. The recent coastwise-trade has been as follows:

IMPORTS AND EXPORTS.	Milreis.
1881-'82.....	158,254,400
1882-'83.....	189,497,100
1883-'84.....	181,350,900
1884-'85.....	120,426,527
Average.....	187,882,282

The decrease in coastwise-trade is due on the one hand to the increase of railroad-traffic, and on the other to the decline in value of Brazilian products.

The coffee exports for the year ended June 30 have been as follow:

PORTS.	1885-'86.	1884-'85.
FROM RIO DE JANEIRO:		
To Europe.....	1,001,817	1,250,517
To United States.....	2,430,188	2,583,200
To other countries.....	111,600	141,666
Total.....	3,543,100	8,980,388
FROM SANTOS:		
To Europe.....	1,160,766	1,676,050
To United States.....	467,216	465,238
Total.....	1,627,982	2,141,288

Shipments of sugar from Pernambuco compare as follow:

PORTS.	OCTOBER 1 TO SEPTEMBER 14.	
	1885-'86.	1884-'85.
To Europe.....	Tons. 11,219	Tons. 24,689
To North America.....	89,358	47,708
Total.....	50,577	72,342

The sugar shipments from Maceio during the twelvemonth ended June 30, 1885, were 523,689 bags. During the year ended June 30, 1886, they were: to Liverpool, 56,689 bags; to the United States, 90,828 bags; coastwise, 9,309 bags—total, 156,826 bags.

The cotton shipments from Pernambuco compared as follow:

PORTS.	JULY 1-30.	
	1885-'86.	1884-'85.
To Liverpool.....	Bales. 39,995	Bales. 71,724
To Plymouth.....	12,961
To Helsingfors.....
To Narva.....	15,930	24,805
To Hamburg.....	12,500
To Bremen.....	12,204	5,849
To Havre.....	2,609
To Barcelona.....	2,947	9,073
To Portugal.....	14,302	8,856
Coastwise.....	27,235
To Montevideo.....	101
Total.....	125,244	134,877

The cotton shipments from Maceio during the year ended June 30, 1886, were: to Liverpool, 28,393 bales; coastwise, 8,752 bales—total, 27,145 bales.

Tobacco shipments from Bahia from Jan. 1 to Sept. 10 were 163,901 seroons, against 173,744 during the corresponding period last year.

The American trade with Brazil exhibits these figures:

FISCAL YEAR—	Exports of domestic goods from the United States to Brazil.	Imports from Brazil into the United States.
1886.....	\$6,450,738	\$41,907,582
1885.....	7,258,085	45,263,660
1884.....	8,645,261	50,265,889
1883.....	9,159,830	44,488,459

The apparent decline is attributable exclusively to lower prices.

At Rio de Janeiro, in 1885, the exports amounted to \$42,000,000, and the imports to \$25,000,000. The trade with leading European nations through the port of Rio compared as follows:

COUNTRIES.	1885.	1884.
ENGLAND:		
Import.....	\$12,500,000	\$15,000,000
Export.....	2,000,000	4,000,000
Total.....	\$14,500,000	\$19,000,000
FRANCE:		
Import.....	\$6,000,000	\$4,000,000
Export.....	4,250,000	2,250,000
Total.....	\$10,250,000	\$6,250,000
GERMANY:		
Import.....	\$3,250,000	\$3,000,000
Export.....	4,000,000	3,500,000
Total.....	\$7,250,000	\$6,500,000

From the preceding tabular statement it appears that while England has been commercially losing foothold in the Rio trade, her two Continental rivals have been gaining.

Mining.—The following notes are taken from the report published in June, 1886, by the Minister of Agriculture: In Minas-Geraes, gold-mining is continued. There are no statistics of production, but those of exportation are:

FISCAL YEAR—	Grammes.	Value.
1883-'84.....	1,166,855	£124,539
1884-'85.....	1,384,794	156,125

It is supposed that the gold production of the empire is much larger than these figures indicate, and therefore that considerable gold is smuggled.

The minister thinks the mining of iron and coal in the empire of more importance than that of gold. The province of Minas-Geraes has more iron than gold mines in operation. In the province of São Paulo, the Ypanema iron-mines are the only ones operated. These belong to the Imperial Government.

A Brazilian company is mining coal at Arroio dos Ratos, in the province of Rio Grande do Sul. This company is said to turn out about 2,000 tons a month, all of which is for local consumption. At Tubarão, in the province of Santa Catharina, an English company is mining.

At Taubaté, in the province of São Paulo, a company is working to advantage the oil-producing shales. In the province of Bahia the tufa-deposits have been worked for oil, and have yielded during the past year about 600 litres.

The Imperial Government has asked for and received tenders for the working of the phosphate-deposits on the islands of Fernando de Noronha, a small group about 200 miles off Cape St. Roque. Two concessions have been granted for deposits upon other islands.

Central Sugar-Houses.—During the business year ended June 30, the Quissama Central Sugar Estate and House has ground 40,791 tons of sugar-cane, and the company netted for the year a profit of 160,028 milreis.

The Rio Branco Central Sugar-House forwarded in August by the Leopoldina and Pedro II Railroad the first consignment of 150 tons of white crystallized sugar of superior quality to Rio de Janeiro. The manufacture on a sugar-estate of this sort of sugar, in which British Guiana has had such remarkable success, is a great step forward, inasmuch as eventually it will supersede the imported refined article. The guaranteed concessions of thirteen central sugar-factories were canceled early in September, and the guarantee on seven others suspended.

Cotton Industry.—There were in operation in Brazil, in 1886, 60 cotton-spinneries and weaving-factories, with altogether 4,836 power-looms and 225,122 spindles. Their joint share capital was 15,000,000 milreis, and they turned out, in 1885, 38,121,568 yards of cotton fabrics, at an average cost of 250 reis a yard. The concerns named were distributed as follow: in the province of Rio, 15; in Minas-Geraes, 14; in São Paulo, 13; in Bahia, 12; and 6 scattered over other provinces. They nearly all use water-power, in which the country abounds. There are but two woolen-weaving factories, one in Rio Grande do Sul and one in Rio de Janeiro. The woolen yarns are all imported.

Maritime Movement.—There entered the port of Rio in 1885 altogether 1,263 vessels under foreign flags, with a joint tonnage of 1,328,905; while there left 1,105, with 1,283,264 tons ca-

pacity in the aggregate. Of arrivals under the British flag there were 463 and departures 437; French, 114 entered and 119 sailed; German, 110 entered and 117 sailed. There arrived coastwise 1,399 vessels and departed 1,580. The coastwise arrivals under the British flag were 93 and the sailings 121; French, 30 entered and 27 left; German, 56 arrived and 76 sailed.

In November, 1885, an importing company, chartered by the Legislature, was organized in Charleston, S. C., for the development of direct trade between Charleston and South America. It began operations by ordering a cargo of coffee from Rio de Janeiro, thenceforward to be repeated monthly, so far as to supply Southern and Western markets. The company is backed by a large capital.

American Cotton Goods.—The export of American cotton goods to Brazil has fluctuated of late years. The following tabular statement shows the general movement to countries south of us, in thousands of yards:

TO—	1882.	1883.	1884.	1885.
Mexico.....	10,584	9,638	9,528	5,877
Central America.....	1,199	1,474	4,588	3,897
Cuba.....	272	471	—	3,604
British West Indies.....	833	1,041	1,208	1,283
Hayti.....	2,591	3,215	4,668	5,439
Santo Domingo.....	2,593	2,849	2,084	2,550
Brazil.....	6,994	5,902	6,267	5,606
Colombia.....	8,251	7,863	4,916	2,904
Venezuela.....	1,886	2,230	4,258	4,319
Uruguay.....	611	668	752	1,389
Argentine Republic.....	2,894	4,662	7,170	4,894
Peru.....	1,001	402	2,694	1,770
Chili.....	5,260	6,863	8,025	10,730
Total.....	44,469	47,344	56,148	53,221

Meanwhile, Spanish America and Brazil take English cotton goods as freely as ever. It is difficult for solid American cotton goods to compete with England, because the common people of Brazil prefer a flimsy, showy, well-dressed cotton cloth that is cheap, to a superior but dearer quality. The enormous consumption of Manchester goods in Brazil is thus explained.

American Locomotives.—There arrived at Rio, early in June, three Baldwin locomotives from Philadelphia, for mountain-traction, each of the weight of 45 tons, with six wheels, each locomotive being furnished with Eames's automatic brake. They are to be used on the Cantagallo Railroad.

Navy.—The Brazilian fleet in active service in 1885 was composed as follows:

VESSELS.	Number.	Crew.	Arma- ment.	Horse- power.
Ironclads.....	8	969	62	7,760
Cruisers.....	6	1,056	53	4,150
Gunboats.....	12	647	15	730
Torpedo-boats.....	9	52	—	—
Transports.....	2	167	2	500
School-ships and auxil- ary craft.....	20	555	17	980
Total.....	57	3,446	149	14,070

There were building one armored vessel and five gunboats.

Army.—The actual strength of the army in 1885, including 1,520 officers of all ranks, was 15,048; in time of war it is raised to 30,000 men. The gendarmerie corps comprises 6,847 men, 1,008 of whom are at Rio. Pending the taking of the new census, the National Guard has been disbanded.

Postal Service.—There were dispatched in 1883-'84 12,15,008 letters, of which 85,820 were Government dispatches, 49,062 post-office notifications, 11,981,776 ordinary letters, and 448,345 registered. There were received 6,250,729 letters, of which 114,110 were Government dispatches, 25,284 post-office notifications, 5,773,564 ordinary letters, and 837,771 registered ones.

Telegraphs.—In June, 1886, there were in operation 10,292 kilometres of telegraph line, with 17,994 kilometres of wire, and 170 stations. The number of messages forwarded during the year was 367,799, representing 5,598,816 words. The messages embraced 4,833 official dispatches, and 819,467 private messages. The receipts were 700,619 milreis, and the expenses 2,109,571, leaving a deficit of 1,408,952 milreis. The official telegrams would have cost, at the rate charged for private ones, 644,583 milreis.

On June 11 a new line of telegraph went into operation between Rio and the city of Bragança, province of Pará, the line measuring 4,500 kilometres.

The Government telegraph system was completed in June, 1886, as far north as the port of Vizeu (Pará), where it connects with the world's cable systems and the Belem land telegraph, putting into direct communication seventeen provinces with one another and the outside world.

The Pedro Segundo American Cable Company was formed in 1886, with a capital of \$2,000,000, obtaining valuable privileges both in Brazil and Venezuela, and having for its object the establishment of direct cable communication between the two countries named and New York. It was hoped that the new line would be in operation before the close of 1886.

Railroads.—The policy of the present Government in regard to railroads is to grant no more guaranteed concessions, to purchase the guaranteed lines constructed by foreign companies, and to lease, if not sell, all the Government railroads; the view being that administration by the state works badly, and serves chiefly to furnish places for swarms of subordinate engineers and idle employés depending upon political influences.

We have shown, in the "Annual Cyclopædia" for 1885, the Brazilian railroad system as it stood at the close of the year 1884, when there were in operation 5,657 kilometres; in course of construction, 2,402; and projected, 3,359. Early in 1886 there were in operation 7,062.175 kilometres; building, 2,267.628; total, 9,320.803 kilometres. All the lines then

in course of construction were of one-metre gauge, except 125 kilometres of 1·10 metre.

During the fiscal year 1885-'86, the earnings of railroads in Brazil generally have been on the increase. Thus the Dom Pedro II Government line earned (net) 6,917,695 milreis, as compared with 4,960,567 in 1884-'85. On the other hand, the Juiz de Fora-Lafayette line in the province of Minas-Geraes built at an expense of 19,443,801 milreis—only earned, in 1885-'86, 377,832 milreis, while it cost 933,894 milreis to work it. On the line from Rio de Janeiro to Paraná on the Rio Velho, 321 kilometres distant from Lafayette, there is direct connection with the capital over a length of 462 kilometres. The number of passengers forwarded during the fiscal year 1885-'86 was 3,430,263, against 3,125,127 in 1884; and there were forwarded on this line into the interior 147,654 tons of goods, against 143,917 the previous year, while there arrived at Rio 282,233 tons of products, as compared with 270,395 in 1884-'85.

The Western Minas Railroad Company made in April a contract for an extension of the line from Ribeirão Preto to the left bank of the Rio Grande. The Santa Isabel de Rio Preto Railroad, seventy-five kilometres in length, from the Barra do Pirahy to Santa Isabel, was finished in April. The Great Southern Railroad Company of Brazil finished during the first half of 1886 the road between Quaraihins and Uruguyana, eighty-four kilometres. The Southern Brazil Rio Grande Company had earned, during the year ended June 30, 1886, £5,361 net, more than enough to pay the interest on the bonds in England, and declare a dividend of 7 per cent. The capital of the Brazil Great Southern Railway remains fixed at 6,000,000 milreis, on which the Government guarantees 6 per cent. dividend.

Insurance.—There has been founded in Rio a domestic Marine and Fire Insurance Company, under the name of the Fluminense, with a capital of 1,000,000 milreis.

Emancipation.—According to the reports received in September, 1886, more than 65,000 slaves, sixty years of age and upward, had been enrolled as free, and it was believed that the number would reach 120,000. There was, furthermore, an impression current that a great many slaves under sixty would not be given in for the registry of slaves then in progress, and would thus become free. The institution was in fact being undermined on all sides, and few if any believe that it will last more than half the term of about thirteen years, to which the law of Sept. 28, 1885, has limited its duration. (See "Annual Cyclopædia" for 1885, page 102.)

A society has been founded for the purpose of freeing, by purchase or otherwise, the numerous slaves belonging to the estates of deceased Portuguese residents in Brazil. One Rio de Janeiro planter, Commandador Joaquim José Breves, has resolved to emancipate and

locate his 3,000 slaves. The number of slaves in the empire on June 30, 1885, was officially reported at 1,133,228; but it was estimated in September, 1886, that their number must have been reduced to fewer than a million, through death and liberation. At the same date the number of living children born free, by virtue of the law of 1871, was 439,881.

The Lash abolished.—As one result of the scandal caused by the judicial whipping to death of criminal slaves at Entreríos in Minas-Geraes, the Senate, on Oct. 1, 1886, passed the bill abolishing the lash as punishment for homicidal offenses by slaves. The penalties are now to be the same as in the case of free-men, except that transportation and fines may not be imposed on slaves, for obvious reasons.

Immigration.—Statistics up to July, 1886, show that during the first half of the year immigration was slowly but steadily on the increase. The number of foreigners in Brazil, according to the latest estimates published, was as follows:

Portuguese	800,000
Germans.....	180,000
Italians.....	50,000
Frenchmen.....	20,000
Englishmen.....	15,000
Poles.....	2,470
Spaniards.....	600
Other nationalities.....	5,000
Total	1,178,070

The Italian Government estimates the number of Italians in Brazil at 82,000, instead of the 50,000 credited to that nationality in the Brazilian tables.

In the province of São Paulo a society was formed in June, under auspices of leading planters and capitalists, for promoting the immigration of agriculturists. The society has made a contract with the provincial government, which engages to pay 85 milreis for every immigrant over twelve years of age; 42½ milreis for children between the ages of seven and twelve years, and 21 milreis for every child under seven years, landed from abroad in the province. The society engages to procure 6,000 *bona-fide* settlers under this contract. This premium on immigration is extremely liberal, and nearly covers the passage from Europe by steamer. There arrived at Rio in May 2,805 immigrants, 1,073 of whom were Italians, 936 Germans, 582 Portuguese, and 95 Spaniards, while there left 536 third-class passengers, leaving the net gain for the month 2,597.

The German Colonial Congress at Berlin closed its sessions on Sept. 16, 1886. Among other resolutions, there was one favoring emigration to southern Brazil, and the Congress appointed a permanent colonial committee to carry out, as far as possible, the ideas adopted concerning emigration. There arrived at Santos, on March 31, a hundred families of immigrants from the Portuguese island of Madeira, for the great coffee-plantations of Dr. Martinho Prado, Jr., Count de Tres Rios, and

Martinho Prado, Sr. On April 7, Dr. Martinho Prado, Jr., issued a circular from São Paulo, saying that the formation of a colonization company had been resolved upon.

Corvado Indians.—In May the Government sent an expedition of forty soldiers, under command of Lieut. Antonio José Dularce, to the uplands skirted by the river São Lourenço, where are numerous camps of Corvado Indians, seven semi-civilized Indians of the tribe accompanying the expedition, which has for its object the eventual civilization of the entire tribe.

Botanical Museum.—Prof. Francis Pfaff, of Geneva, Switzerland, has been appointed director of the Section of Chemistry at the Botanical Museum of Manáos. This section is to be devoted to the study of Amazonian flora, so far as applicable to industrial purposes.

Art Society.—There was in course of formation in September at Rio a society for the promotion of the fine arts, having for its object the facilitating of sales of the works of Brazilian and foreign artists. The shares subscribed are to constitute a fund, to be raffled by the shareholders among themselves, with the understanding that the winners employ the money in buying meritorious objects of art appearing at annual exhibitions.

Steamship Lines.—The Government has extended the privileges decreed by the law of May 4, 1882, to the Adria-Hungarian Sea Navigation Company, carrying on regular mail service between Fiume, Austria-Hungary, and Brazilian ports. In conformity with an arrangement made with a Copenhagen Steamship Company and the North-German Lloyd, direct steamship communication is to be established between Riga, Russia, touching at Antwerp, Brazilian ports, and Buenos Ayres.

The "Alliança," the latest-built vessel of the United States and Brazil Mail Steamship Company, sailed from New York on the first voyage to South America on Oct. 2. She was built by John Roach & Sons, and is a screw-propeller of 3,184 tons register, with a cargo capacity of 150,000 cubic feet and a coal capacity (in bunkers) of 400 tons. Her length over all is 326 feet, beam 42 feet, and depth of hold 24 feet 6 inches. Her first section of keel was laid Feb. 23; she was launched July 17, and delivered to her owners at New York, Sept. 27, 1886.

BRITISH COLUMBIA. The Canadian Pacific Railway Company abandoned its original intention of locating its Pacific terminus at Port Moody, the place being deficient in harbor accommodation, and a site was chosen at the entrance of Burrard Inlet. Here the company obtained from the Provincial Government a grant of land, and upon this land a city was laid out and named Vancouver. The infant city had made phenomenal progress when, on June 12, it was totally destroyed by fire. About five hundred houses were reduced to ashes in two hours. A fortnight later, two hundred houses were in course of erection, and the place

speedily resumed its rapid development. Next to the fire, the principal check to the progress of the city has been the action of certain land-owners between Port Moody and Vancouver, who obtained injunctions against the Canadian Pacific Railway Company, to prevent tracks being laid across their property. The legal proceedings were really instituted in the interests of the people that had invested money in Port Moody, on the faith of the promise that that place would be the terminus of the railway. The Canadian Pacific, which had been running freight-trains between Montreal and British Columbia since Nov. 2, 1885, opened a daily passenger service between Montreal and Port Moody on June 28, 1886. The Imperial Government (Lord Salisbury's), recognizing the importance of the Canadian Pacific Railway as an alternative route from England to India, and the other Eastern possessions of the British Empire, promised its influence to obtain from Parliament a grant to subsidize a line of mail-steamer from Vancouver to Japan, China, etc.

Cabinet Change.—The Hon. Simeon Duck was appointed Minister of Finance and Agriculture, an office formerly held by the Provincial Secretary. (For further details regarding the Cabinet, see "Annual Cyclopædia" for 1885.)

Mining.—The report of the Minister of Mines, for the year ending Dec. 31, 1885, shows a larger number of miners to have been employed in gold-mining in the province than in any year since 1866, and the average earnings to have been lower than at any time since 1858. Both results are partly accounted for by a rush to Granite creek toward the close of the mining season, and by a larger number of Chinamen working on the bars of Fraser river, which had been already worked and reworked. There were employed 2,902 miners, of whom 1,056 were whites. The banks exported gold to the value of \$594,782, and it is estimated that one third more, or \$118,956, was carried away in private hands, making a total of \$713,738, the average yearly earnings per man being, therefore, \$246. The profits of this industry have been steadily decreasing for years. Important discoveries of gold were made in the Similkameen district, a most promising field being opened at Granite creek, where a lead of heavy gold, having a steady run for four miles, was found.

The output of coal amounted to 365,000 tons, against 394,070 tons in 1884, and 213,000 tons in 1883. The decrease is attributed to the glutting of the San Francisco market with British and Australian coal.

Island Railway Lands.—A tedious dispute with the Dominion Government, with reference to the settlement of the lands transferred to the Dominion in trust by the province in 1883 to secure the construction of the railway from Esquimalt to Nanaimo, was brought to a satisfactory conclusion this year. The administration of these lands during the construction of

the railway was to belong to the Provincial Government, in order to facilitate their colonization. As the lands were partly settled already, and all patents then granted had been based upon the surveys of the Provincial Government, some of which surveys, made early in the history of the colony, were admittedly imperfect, much inconvenience and hardship might have been caused had it been arranged for the Dominion Government to assume the control of the lands, and issue patents upon a survey of its own. A number of applications from actual settlers within the Island Railway belt for patents for lands pre-empted by them were transmitted by the Provincial Government to the Dominion Government. For more than a year no patents were issued by the latter, which demanded, before granting any, the originals of all documents forming the basis of title to the land, including the original applications for such patents that were made to the Government of British Columbia, "as agents in this matter of the Government of Canada." Complaint was also made of insufficiency of description of the lands. The Provincial Government pointed out that, although acting as agents, they were the real principals in the matter, insisted upon their right to administer the lands, and protested against the Dominion Government retarding settlement. Ultimately the Dominion Government agreed to issue the patents, if the Government of British Columbia would, by order in Council, assume the responsibility for their issue upon applications certified by the latter. The order in Council was passed.

The Island Railway was finished, and the train service began, Oct. 1.

BULGARIA, a principality in Eastern Europe. By the Treaty of Berlin, signed July 13, 1878, the Turkish province of Bulgaria, north of the Balkan mountains, was created into an autonomous and tributary principality under the suzerainty of the Sultan, having a Christian government and a national militia, and ruled by a prince elected by the people and confirmed by the Sultan, with the consent of the treaty powers. In case of a vacancy, a new prince is to be chosen in the same manner. No member of any of the reigning houses of the great European powers is eligible.

Prince Alexander I, born April 5, 1857, son of Prince Alexander of Battenberg, of the grand-ducal house of Hesse, a branch of the Hohenzollerns, was elected hereditary prince by the Great Sobranje, or Constituent Assembly, on April 29, 1879. He is a first cousin of the Emperor of Russia, being nephew of the late Empress. Before his elevation to the Bulgarian throne, he was an active officer in the Prussian army. On Sept. 7, 1886, he abdicated the throne, after nominating a regency, and confiding to them the executive power during the interregnum.

The legislative power was vested by the Constitution of 1879 in a single chamber, called

the Sobranje, or National Assembly, the members of which are elected directly, by universal suffrage, in the proportion of one to every ten thousand of the population.

Area and Population.—The area of the principality is 24,360 miles. The population in 1881 was 2,007,919, comprising 1,027,813 males and 980,116 females. Sofia, the capital, had a population of 20,501; Rustchuk, 26,163; Varna, 24,555; Shumla, 23,093; Widdin, 13,714; Razgrad, Sistova, Plevna, and Tirnova, between 11,000 and 12,000. The Bulgarian language, mingled in the northwest with the Servian, which is a dialectical variation, was spoken by 67 per cent. of the population; 26·26 per cent. are Turks, 2·44 Wallachians, 1·87 gypsies, and the remainder Greeks, Jews, and Tartars. The Orthodox Greek faith is professed by 70 per cent. of the inhabitants, while 28·79 per cent. are Mohammedans. The population depends almost entirely on agricultural and pastoral pursuits.

The Army.—The military force consists of 8 regiments of infantry (each of 3 battalions), 9 squadrons of cavalry, 12 batteries of field artillery (with 96 guns on the war footing and 48 in peace), 2 companies of fortress artillery, and 5 companies of engineers. The peace strength of the army is 22,570, the war strength 62,370 men. Military service is obligatory on all who are capable of bearing arms.

Finances.—The revenue for 1885 was estimated at 34,899,900 lei, and the expenditure at 35,780,324 lei (1 lei = 1 franc, or 19·3 cents). The Assembly before adjourning on July 23, 1886, authorized a loan of 33,000,000 lei for completing the Zaribrod-Vakarel Railroad, and purchasing the Rustchuk-Varna line.

The Treaty of Berlin stipulated that the share in the debt of Turkey to be assumed by Bulgaria should be fixed by an agreement between the signatory powers, but the powers have not yet acted.

Commerce.—The export of wheat is 1,500,000 tons. The other exports are wool, tallow, butter, cheese, hides, flax, and prunes. The principal imports are cotton manufactures, iron, wine, timber, sugar, salt, and petroleum. A duty of 8 per cent. is levied on imports. Eastern Roumelia has been incorporated in the Bulgarian customs district, though without the sanction of the Porte.

Railroads.—There is in operation a line of railroad, running from Rustchuk to the port of Varna on the Black Sea, and having a length of 140 miles. A line from Vakarel to Zaribrod, passing through the capital, is expected to be completed in the summer of 1887, joining the Servian railroads to the system of eastern Turkey. A branch road, running from Vakarel to Belova and Sarambej, was expected to be finished before the close of 1886. Its construction was hastened for administrative and strategic reasons, since it will shorten the time required in the journey between Sofia and Philippopolis from twenty-four to twelve hours.

Eastern Roumelia.—The Bulgarian districts south of the Balkans were constituted by the Treaty of Berlin into an autonomous province of Turkey, having a Christian Governor-General, nominated by the Porte, and confirmed by the agreement of the powers, for the term of five years. The legislative authority was vested in a single chamber, called the Provincial Assembly, consisting of 36 members, elected by universal suffrage, 10 nominated by the governor, and 10 of the principal judicial and ecclesiastical functionaries holding their seats *ex officio*. The Sultan retained direct political and military authority over the province, and reserved the right of providing for the defense of the land by erecting fortifications and maintaining garrisons on the land and sea frontiers. This right he has not exercised. A native gendarmerie and local bodies of militia were organized for the purpose of preserving internal order. The officers were named by the Sultan, having regard to the religion prevailing in the various localities.

Area and Population.—The province has an extent of about 13,500 square miles. The population, which was returned in 1880 as 815,946 souls, is over 976,100, according to the census of Jan. 13, 1885. There are 682,756 Christian Bulgarians, 200,499 Mohammedans, 53,045 Greeks, 27,201 gypsies, 6,993 Jews, 1,867 Armenians, and 3,738 foreigners. The population of Philippopolis, the capital, is 33,442.

Finance.—The organic statute of 1879 provides that an annual sum must be paid into the Turkish treasury equal to three tenths of the public revenue. The amount was fixed by the European Commission that framed the organic statute at 240,000 Turkish pounds, or about \$1,000,000. Owing to the destruction of property and disturbance of industry during the war of 1877, and the subsequent emigration of a large part of the Moslem population to Turkey, and of many of the Bulgarians into Bulgaria, the revenue fell short of the estimated normal amount by 25 per cent. The payment of the Turkish tribute ceased in a few years. In 1882 the Provincial Assembly passed a law fixing the annual amount of the tribute at 180,000 Turkish liras.

The budget estimates of the revenue for 1885-'86 was 672,550 Turkish pounds, that of the expenditure 676,650 pounds. Two thirds of the revenue is derived from direct taxes.

Commerce and Industry.—The people are chiefly engaged in agriculture, which is in a backward condition. Besides cereals, there is a considerable production of wine. Woolen cloth and braid are exported to Turkey, and timber in large quantities to Asia Minor. The total value of the imports in 1883 was \$2,400,000; of the exports, \$2,820,000, of which sum \$1,320,000 represents the cereal exports. The trade with Bulgaria constituted 27 per cent. of the total foreign trade.

Union with Bulgaria.—By the revolution of Sept. 17, 1885, the government was over-

thrown, the Governor-General expelled, and the union with Bulgaria proclaimed. Prince Alexander of Bulgaria was invited by the revolutionary leaders to place himself at the head of the movement, and take over the government of the province. With the approval of his ministers he accepted the responsibility, and appointed his representatives to administer the government. Servia, on the ground that the aggrandizement of Bulgaria disturbed the equilibrium of the Balkan states, mobilized her army with the intention of seizing upon an equivalent addition of territory in Macedonia, or of forcing Bulgaria to restore the *status quo ante*. The rapid mobilization of the Turkish army frustrated the Servian and Greek schemes of annexation. The Servian troops then invaded Bulgaria at various points. The main force was defeated at Slivnitz, but the Bulgarians were restrained from marching into Servia by the threats of Austria. An armistice till March 1, 1886, was arranged at the close of 1885, the position of the troops and the results of the campaign being referred to an international commission of military experts. Russia exerted her influence to induce the Turkish Government to intervene in Eastern Roumelia.

In agreeing to the division of Bulgaria into two parts by the Treaty of Berlin, the Russians had counted on dominating and eventually absorbing the principality. The educated Bulgarians, who in the American College in Constantinople were trained in the theory and spirit of constitutional liberty, and the German prince, who at first showed small respect for the principles of Slavic democracy and western liberalism, at length found a common motive and bond of sympathy in resisting the Russian diplomatic and military agents, who treated Bulgaria as a Russian province, and the prince as a satrap of the Czar. In his attitude of independence Alexander was encouraged by English diplomacy. In Constantinople, the British representative, Sir William White, and the Russian ambassador, pursued an active rivalry in endeavoring to persuade the Porte to adopt their opposite counsels. In sending a Turkish commissary into Eastern Roumelia the Sultan yielded to Russian advice, but after the success of Bulgarian arms, and the confirmation of the spirit of independence in Eastern Roumelia, English counsels prevailed. Sir Frank Lascelles, the British consul-general at Sofia, who was knighted for his diplomatic success, encouraged Prince Alexander to embrace the national cause. The Czar ordered home the Russian officers, leaving the Bulgarians with only captains and lieutenants to lead them against the Servian invaders. Alexander was treated as a rebellious vassal and ignominiously dismissed from the Russian army. After the Bulgarian victory, the Czar directed his animosity against the person of the prince only. Though long resisting the decision of the powers, Russia was at last constrained to agree to the personal union of Bulgaria and Eastern

Roumelia, and signed the protocol of April 5, 1886. Russian agents then renewed their efforts to upset the Battenberg prince in Bulgaria, and his cousin, the Czar, repelled every proposal for a reconciliation.

The Turkish Agreement.—Gadban Effendi, the Turkish commissioner to Bulgaria, convinced himself that the personal union of the two Bulgarias was inevitable, and returned to Constantinople bearing proposals from Prince Alexander. The prince asked to be appointed Governor of Eastern Roumelia for the statutory term of five years, and proposed that the Bulgarian Sobranje and the Roumelian Assembly should continue to legislate independently for the state and the province, but should appoint delegations to consider common affairs; that Bulgarian officers might serve in the Roumelian army, and Roumeliote officers, with the consent of the Porte, in the Bulgarian army, while appointments of generals to commands in Eastern Roumelia should be subject to the approval of the Porte; and that the question of the tribute should be determined by a financial commission. Gadban Effendi returned to Prince Alexander on Jan. 11, with the assurance that the Porte would sanction the union, provided it could be accomplished without impairing the sovereign rights of the Sultan. An agreement was concluded between the Porte and Prince Alexander by the end of January. It included a defensive alliance between Turkey and Bulgaria, and provided that the Governor-General of Eastern Roumelia should receive his appointment for the first period of five years, subject to the approval of the signatory powers, but that for future terms the nomination of the Porte should be sufficient.

Conference of the Powers.—A diplomatic conference was held at Constantinople for the purpose of taking action upon the separate agreement arrived at between the Porte and Prince Alexander. This Turco-Bulgarian agreement was approved without reserve by Great Britain, France, and Italy on Feb. 4; but Austria and Germany withheld their answer in order to consult with Russia and with each other. The Russian Cabinet objected strongly to the provision promising the assistance of the Bulgarian army in case the dominions of the Sultan should be attacked by a foreign power. Upon Russia's persisting to oppose the union, a definite counter-proposition was demanded of her, while Great Britain expressed a desire to come to an agreement with the St. Petersburg Cabinet and accept modifications not incompatible with the main principle of a personal union. Russia would have accepted the Bulgarian arrangement with Turkey if it had provided for a union of Bulgaria and Eastern Roumelia under the Prince of Bulgaria, without designating Prince Alexander. The Russian Government at first objected to the limitation of the term of the governor-generalship of Eastern Roumelia to five years. Afterward, when England, Austria, and Italy had

repeated their recommendation to make the Prince of Bulgaria Stadholder of Eastern Roumelia without limit of time, and when Germany had expressed approval of the principle, the representative of the Czar changed about, at the time of the conclusion of peace with Servia, and proposed that the governor-generalship should be for five years, and that a renomination should proceed from the Porte, and receive the approval of all the powers. This proposal was accepted at once by all the powers, though France raised an objection to the immediate approval of the Turkish agreement on the ground that the inclusion of Eastern Roumelia in the Bulgarian customs district would be prejudicial to French commercial interests. The Turco-Bulgarian negotiations had reached their final stage and the treaty was ready for the signature on March 8, when Prince Alexander created a difficulty by refusing in advance to accept the governorship of Eastern Roumelia if it were offered to him only for the term of five years. A few days later he recalled Zanow, his plenipotentiary, from Constantinople, and expressed his willingness to accede to the limitation of five years, provided the renomination for a further term of five years should come from the Porte, but not if it were made dependent on an agreement of the Great Powers, thus enabling Russia or any other of the powers at the end of every five years to defeat or place new conditions on the continued union of the two Bulgarias. In a note to the Porte, dated March 30, he renewed his protest, and Italy was disposed to support his view. Yet, in order to bring the Balkan complications at length to a peaceful issue, the western powers accepted the Russian proposals, and signed a protocol of the modified agreement on April 5. The Bulgarian prince accepted the conclusions of the conference, with a reservation as to the point to which he had objected.

The Armistice.—During an exchange of views between the powers the Russian Government issued a circular note in favor of insisting on the immediate and complete disarmament of Bulgaria and Servia. The powers accepted this suggestion, and concluded to include Greece in the proposal. They accordingly made a joint proposal that the three Governments should agree on a simultaneous partial demobilization in a collective note, presented Jan. 12. The Bulgarian and Roumelian reserves had already been sent home on furlough till the 1st of March; but the Servian Government had just issued a decree recalling the reserves, and was providing itself with new batteries of Bunge cannon, and seeking to raise another war loan. The officers and official press spread the opinion in the country that Servia had not been beaten in the war, notwithstanding the decision as military experts of the international commissioners for the armistice. The Belgrade Government still insisted on the restoration of the *status quo ante* in Roumelia, and

declared that it would not conclude peace until the Roumelian question had been settled satisfactorily to Servia. In the beginning of January commissioners were appointed to conduct the peace negotiations. The Bulgarian Government appointed M. Geshoff, and the appointment was ratified by the Porte. M. Mijatovic, the Servian minister in London, was named by his Government. Vienna was proposed as the place for holding the sittings of the peace conference, but, when Prince Alexander objected, King Milan, on Jan. 11, suggested Bucharest, and the proposal was satisfactory to the Bulgarian prince.

Treaty of Peace with Servia.—Bulgarian and Servian representatives met in Bucharest, to conclude terms of peace. On Feb. 2 they agreed upon the order in which the points at issue should be taken up, and the day following began negotiations. An identical communication of the representatives of the powers in Constantinople recommended that in the peace negotiations all thoughts of a war indemnity for Bulgaria should be given up, that the Berlin Treaty should be respected, that the Eastern Roumelian question should be excluded from the negotiations as a purely internal matter, and that the diplomatic representatives of the powers in Bucharest should be kept informed of the progress of the treaty. Servia hesitated to agree to terms of peace up to the last minute, and continued her armaments and her warlike attitude. The Turkish threat that the recommencement of hostilities against Bulgaria would be regarded by the Porte as a declaration of war finally brought her to terms.

The peace negotiations were prolonged until the very day when the armistice expired, March 1. The Turkish minister to Belgrade then proposed a treaty to consist of a single article: "Peace is re-established between Servia and Bulgaria from the day of the signing of the present treaty. Ratifications will be exchanged at Bucharest within fourteen days, and if possible sooner." The Servian minister, Garashanin, agreed to this proposal, and the powers were notified.

Geshoff, the Bulgarian, and Madjid Pasha, the Turkish plenipotentiary, received instructions to sign the treaty, which was duly executed on March 3. Servia still refused to enter into a treaty of friendship with Bulgaria, or to resume diplomatic intercourse.

Session of the National Assembly.—The Sobranje was opened on June 14. In the speech from the throne the prince expressed his delight that the union of North and South Bulgaria was an accomplished fact. He had taken a decisive step to render the union more complete than a mere personal union, in calling together a common National Assembly. Urged by Russia, the Porte called Alexander to account. He explained that, since he had to submit the decisions of the conference of ambassadors at Constantinople to the representatives of both Bulgarias, he had summoned them

to meet together as a matter of expediency. While the Turco-Bulgarian commission to revise the Eastern Roumelian statute had never yet begun its labors, Prince Alexander was indefatigable in assimilating the internal organizations of the two states. A branch of the Bulgarian National Bank was established in Philippopolis. The judicial system in Roumelia was reformed; there were twenty-seven courts constituted in the single districts, six courts in the chief towns of the departments, and a court of appeals in Philippopolis. The Bulgarian code of law was established in Eastern Roumelia. The Bulgarian Government did everything to stand on a good footing with the Porte. The National Assembly in Sofia voted a credit to pay the arrears in the land-rents of Eastern Roumelia. All other financial questions were to be arranged with delegates from Constantinople. The negotiations for the revision of the organic statute of Eastern Roumelia were begun, and for some time carried on with perfect concord between the Turkish and Bulgarian Governments. Delegates were appointed on both sides to delimitate the districts in the Rhodope mountains, inhabited preponderantly by Mohammedans, which, according to a decision of the conference of ambassadors, should revert to Turkey. The Turkish Government afterward, yielding to Russian influences, raised objections to the political and administrative unification of the two Bulgarias, and broke off negotiations.

Dethronement of Alexander.—In the night of Aug. 20 a detachment of soldiers and a band of officers took possession of the palace of the prince and seized his person and that of the prime minister. The following day the leaders of the pro-Russian party, who had organized the conspiracy, announced his abdication, and formed a provisional government.

The chief conspirators were the ex-Minister Zankoff and Major Grueff, the commandant of the military academy, with whom were associated the Metropolitan, Clement, and Col. Stojanoff. Officers were induced to join in the plot by promises that they would receive commissions in the Russian army corresponding with their Bulgarian rank. Money was furnished from Russia in abundance to carry out the state-stroke. By a trick the troops were removed from Sofia before the attempt. The Minister of War was beguiled by fictitious reports announcing extraordinary military preparations, which were telegraphed from Servia with such frequency that the Porte demanded explanations from King Milan's Government. Minister Nikisoroff, convinced that the intelligence was genuine, proposed to the Prince to forward troops to the frontier. The two regiments garrisoned at Sofia were accordingly sent to Slivnitsa. An artillery regiment stationed at Dubnitza, near the capital, had, by the aid of plentiful bribes, been won over by the conspirators. Instead of marching to the Servian frontier, as it had been ordered to do,

this regiment during the night silently occupied the streets of Sofia, and surrounded the princely palace. A battalion of the Alexander regiment was still encamped in Sofia, but it was surprised and disarmed. The chief of the military academy, the artillery colonel, Zankoff, and the Metropolitan, with a number of military cadets and officers, gained access to the palace between two and three o'clock in the morning by climbing over a wall. The cadets overpowered the guards and bound them to trees. An adjutant, while hastening for help, was made a prisoner. The leaders burst into the prince's apartments before he was dressed, and with drawn revolvers compelled him to accompany them to the ministry of war. There Zankoff said to him that his continuance on the throne was the ruin of Bulgaria, and that all parties desired his abdication. "Are all parties united in that?" he asked. Zankoff replied "Yes." "And the army also?" Col. Stojanoff nodded his head. Grueff hastily wrote a few lines and presented the paper to Alexander to sign. Officers aimed their pistols at the prince with the intention of killing him if he refused to abdicate. "I can not read what you have written," he said, and then wrote underneath "God protect Bulgaria! Alexander." The prince was carried in a coach, guarded by a strong escort, to a cloister. While the leaders passed on to the house of Karaveloff, a salvo of artillery aroused the populace. Karaveloff was informed of what had occurred, and asked to join the movement. On refusing, he was placed in confinement. Money was distributed among the people, and many were found who for ten rubles were willing to shout "*Zivio Czar!*" and swell the demonstration of Russian sympathizers at the Russian consulate.

A proclamation was read to the people, who assembled upon the discharge of artillery, announcing the abdication of the prince and the formation of a provisional government, consisting of Karaveloff, Zankoff, Clement, and Nikisoroff. Karaveloff refused firmly to join the revolutionists, and was kept under guard. Nikisoroff also refused to figure in the list. It was not till the evening of the 21st that, after repeated attempts, a provisional government was formed, under the presidency of Clement. In order to persuade the people that the revolution had been accomplished by the co-operation of all political parties, telegrams were sent to every part of the country, calling upon Bulgarian patriots to sustain the provisional government, which were signed with the names of public men who had no part in the conspiracy, and most of whom were opposed to it. The list of members of the provisional government, containing the names of Karaveloff and Nikisoroff, was published throughout the land, and not recalled, even after the government was constituted without them, and after they themselves were placed in duress for refusing to join in the movement. The revolution was easily accomplished throughout the country

by the official announcement that the prince had voluntarily abdicated. In Philippopolis the former officials and Russophile adherents of Gavril Pasha set up a revolutionary government without opposition.

Alexander remained during Saturday, the 21st, in the cloister. There was a design to murder him, but the Russian consul-general upon hearing of it told the leaders of the conspiracy that they would be required to answer with their heads for the prince's safety. On Sunday he was placed on his yacht, and taken down the Danube to Reni-Russi in Bessarabia. He arrived there in the afternoon of the 24th, but was not allowed to land until the next day, when permission came from St. Petersburg for him to pass through Russian territory by any route that he chose. On the morning of the 26th he left with his brother in a special train for Lemberg.

The Counter-Revolution.—The first step undertaken by the revolutionary ministry, after securing the adherence of some of the local officials, and removing others who were friendly to the prince, was to administer the oath to the army; but in that quarter they encountered an unexpected resistance. The soldiers and officers received with sorrow and dismay the official announcement from Sofia that Prince Alexander, in the consciousness that his continuance on the throne would work incalculable injury to the country, had solemnly abdicated, and that a provisional government had been formed under Karaveloff and Zankoff. The higher officers in different parts of the country consulted with each other, and tested the sentiments of the rank and file. A common feeling of fidelity and devotion to the prince who had fought with them at Slivnitz was found to exist among all, excepting the two regiments that took part in the rebellion. The loyal officers placed themselves in communication with Stambuloff, the President of the Sobranje, Radoslavoff, and other politicians of nationalistic views. After learning some of the circumstances of the prince's deposition, the garrisons of Widdin, Tirnova, Shumla, Plevna, Slivnitz, and nearly all the Eastern Roumelian posts revolted, declared their loyalty to the prince, and threatened to march upon the capital and restore him to the throne. Clement issued a bulletin declaring that all the regiments had taken the oath, but failed to convince the people. The officers of Alexander again appeared in uniform, and his adherents manifested a joyful expectation of a turn in events. On the 23d the Alexander regiment, that had been stationed at Slivnitz, entered Sofia. The prime minister was released from captivity. The members of the provisional government resigned their powers into the hands of Karaveloff, who formed a new provisional government, with Stambuloff and Nikisoroff for his colleagues.

The troops in Philippopolis regretfully took the oath of fidelity to the provisional govern-

ment, with the exception of one *drushina*, or battalion, of the regiment of Philippopolis, which, on some pretext, postponed the ceremony. The commander of the *drushina*, Capt. Veltsheff, was a devoted admirer of the Tattenberg prince. When the list of ministers appeared without Karaveloff's name, that officer spoke with Col. Mutkuroff, the commander of the troops in Eastern Roumelia, and was requested by him to secretly ascertain the sentiments of the officers. Veltsheff soon convinced himself that all the officers of his regiment were faithful to their sovereign, and that the soldiers were ready to rise on behalf of the soldier-prince. Some civilians were taken into the secret, and instructed to gather quietly at the palace in the evening. Veltsheff marched his battalion there under the pretext of taking the oath, seized the palace and the telegraph-office, and then entered the city and announced the revolt at the foreign consulates amid the hurrahs of the people. Through the telegraph it was learned that the Varna regiment had risen about the same time. Capt. Nikisoroff, commander of the Rhodope regiment, was informed of what had occurred, and answered over the wire that he would consult with his subordinates. After a long pause, the message came that the Rhodope regiment had risen. Capt. Petreff, who commanded the Balkan regiment, who was a stranger to the Philippopolis officers, was cautiously sounded, but showed by his answer that he was in sympathy with the movement, and, when informed of the state of affairs, sent back word that he and his command were prepared to fight for the prince. Finally, a dispatch was sent to Stambuloff at Tirnova, and, when he returned an encouraging answer, the success of the counter-revolution was assured.

While Karaveloff and Nikisoroff, who was his close political ally, remained in Sofia, and made ineffectual attempts to exercise the authority of the Government, Stambuloff traveled through the country, visiting the military camps and organizing the counter-revolution. The officers were unwilling to trust the Karaveloff Government. Its chief was strongly suspected of complicity in the conspiracy to depose Prince Alexander, although he had refused to join the leaders of the revolution, and had denounced them in vigorous terms. Stambuloff, who possessed the full confidence of the officers, shared their distrust of Karaveloff, and refused to act with his colleagues in the provisional government. The officers requested Stambuloff to assume the direction of affairs, and he and Radislavoff, with the co-operation of Col. Mutkuroff in Eastern Roumelia, formed a rival provisional government in the interest of Prince Alexander, which was recognized by the army and the population in the west, in the Danubian towns, and in Roumelia. He sent appeals to the prince to return to his throne, assuring him of the fidelity of the regiments and of the population in Rustchuk, Tirnova, Sistova, and

throughout Eastern Roumelia. Col. Nikolaieff, chief commander in the late war, returned from Germany, and assumed command of the troops. Stambuloff telegraphed to Natchevich, the Bulgarian diplomatic agent in Bucharest and Minister for Foreign Affairs, instructing him to inform the representatives of the powers of his assumption, at the request of the army and the people, of the extraordinary powers granted him as President of the Sobranje by the Constitution, until the return of the lawful sovereign.

The Prince's Restoration.—As soon as Alexander reached Polish ground, he was greeted with enthusiastic popular demonstrations. When he arrived in Lemberg, he learned that he had been driven out of the principality by a band of conspirators, and that only a small party in Bulgaria were hostile to him. In Bulgaria counter-revolution was in progress, and his party assured him of a favorable reception. From England he was encouraged to return. He perceived that the popular feeling in Germany, in Hungary, and throughout Western Europe, was in his favor. Without being able to calculate how far the Governments of Germany and Austria-Hungary might be influenced by popular impulses, or whether the sympathies of England were purely platonic, or to what extent the Czar would countenance the palace revolution and insult Bulgarian patriotism, he determined to return to Bulgaria. In Sofia the Alexander regiment stood guard in the streets, but the rebellious Kustendil regiment refused to leave the city for the station to which it had been ordered. Fatal duels took place between the officers of the rival regiments, and there was danger of a sanguinary collision at any moment.

Alexander started to return to Bulgaria on August 28, and traveled through Roumania, where the Government and people manifested a cordial and sympathetic interest. Entering his principality, he was met by Stambuloff and other devoted friends. He nominated a new ministry, and, in company with its members, made a tour through the country, where he was everywhere received with enthusiasm. In Sofia the members of the first provisional government were imprisoned, and those of the second were placed under guard. The Shumla regiment left Sofia, and united with the other mutinous regiment a few miles from the city. They were surrounded by Roumeliot troops and the Alexander regiment, and at length surrendered at discretion.

Abdication of Alexander.—As soon as Alexander again found himself on Bulgarian soil, at the head of his troops, surrounded by a constitutionally appointed ministry, and in the full exercise of his sovereign powers, he made a last attempt to conciliate the Czar, sending from Rustchuk, on Aug. 30, a submissive and humble message, in which he stated that his object in returning to Bulgaria was to avert civil conflicts and bloodshed, restore constitu-

tional order, and assert the monarchic principle, and closed by saying that he owed his crown to Russia, and was willing to place it in the hands of Russia's Czar. The Emperor returned a gruff answer, in which he did not even deny that the Russian Government was a party to the revolution, in answer to the prince's expression of confidence that such was not the case, but simply said that he disapproved of the restoration of Alexander.

Soon after his arrival in Sofia, Alexander received from the German and Austrian consuls an identical note, wherein both powers entered a protest in advance against the execution of any of the mutineers and conspirators. He perceived at once that he could not expect from the German powers any moral support in opposition to the will of Russia, and felt that Russian plots would render his stay impossible, and plunge the country into disorder and anarchy unless the laws could be enforced against traitors, and the discipline of the army maintained. Bribes, threats, and promises could again be employed to effect his removal by a stronger faction than took part in the revolution of Aug. 21, without the need of direct Russian intervention. He therefore decided that the best chance for the maintenance of Bulgarian independence lay in his abdication, and that the immediate resignation of the throne might save the country from strife and confusion that would result in Russian occupation, and himself from a second expulsion.

After a popular ovation and a review of the troops, on the 3d of September, Alexander addressed the officers and the members of the diplomatic corps in his palace, saying that for seven years he had labored for the independence and the interests of Bulgaria, and that his chief care had been the army and the officers, whom he had regarded as his children. He could now leave Bulgaria without causing disorder, and would always pray for the country; his heart would be with his officers, and he would be the first who as a volunteer would desire to go into the field with them. He could no longer remain in Bulgaria, because the Czar of Russia would not have it, and because his presence in Bulgaria conflicted with the interests of the country. When Popoff assured him that the army would stand by him, he answered that the independence of Bulgaria required that he should leave the country; that if he remained, it would lead to a Russian occupation. But before he went, he said, he would consult the higher officers, and appoint a regency which would protect the interests of the officers. In any case, he said, he could depend on the army.

On Sept. 7, before his departure, the prince addressed a circular to the diplomatic agents in Sofia, in which he renounced the throne, on the ground that foreign political relations had made the step necessary. In the night following, his manifesto was affixed in the provincial towns and villages. He nominated as regents

Karaveloff, Stambuloff, and Mutkuoff, and submitted their names to an assembly of leading civilians and the higher officers.

The composition of the regency was a subject of contention between the politicians and the military. The officers considered that they should have had at least two representatives, while some of the deputies held that the regency as constituted was illegal, because the Constitution prescribed that only such as had filled the posts of ministers or judges of the Supreme Court could be called to the office—a condition that was not fulfilled in the case of either Stambuloff or Mutkuoff. The officers objected to Karaveloff, who was suspected of having been concerned in the prince's deposition. At eleven o'clock the notables proceeded to the palace and reported that they were convinced of the truth of Karaveloff, and were satisfied with the nominations to the regency. Five minutes later a printed proclamation was circulated announcing the departure of Prince Alexander in the afternoon.

The soldiers were drawn up in the streets of the city, and the inhabitants of Sofia lined the road for ten miles outside. As the prince's convoy passed along, the army and populace demonstrated their grief in an unmistakable manner. In bidding farewell to the officers who rode in the convoy, neither Alexander nor they could suppress their emotion. At Lom Palanka, Widdin, and smaller places, the people showed by enthusiastic demonstrations their attachment for the hero of Slivnitsa.

Attitude of the Powers.—The understanding between Germany and Austria, as appeared from Premier Tisza's answer to the interpellations in the Hungarian Parliament, was that Prince Alexander was to be set aside and Russia allowed to regain, as far as she could by moral pressure, the influence in Bulgarian affairs that she possessed before the estrangement of the prince and people by the arrogant interference of the Czar's agents. Alexander was in bad odor on account of his disregard of the Berlin Treaty and of the treaty powers.

The course of England was resented as an attempt to gain political and commercial prestige by intrigues that threatened to plunge Europe in war, without herself incurring risk or responsibility. Alexander had made himself objectionable to Austria and Germany as well as to Russia, because he had proved amenable to such influences. It was only after the Austro-German position had been defined by the Hungarian minister that Lord Randolph Churchill, and afterward Lord Salisbury, intimated, in public speeches, that Great Britain would aid in repelling a Russian movement.

In his avowal that he had received his crown from Russia and his offer to surrender it to the Czar, Alexander showed as little respect for the sanction of Europe as in placing himself at the head of the Roumelian revolution. If the Czar had taken him at his word, and sent a commissioner to administer the Gov-

ernment of Bulgaria, Austria would have resisted, with the support of Germany. Russia was given to understand that the allied empires would not countenance nor permit a military occupation of Bulgaria, nor the establishment of a protectorate.

The Regency.—The prince appointed as regents three men whom he considered his principal adherents, thoroughly identified with the policy he had pursued in recent years. The ministers also were mostly men of conservative and nationalist views. The portfolio of finance was given to Geshoff, while Dr. Stoiloff was made Minister of Justice, and Natchevich of War. The presidency of the Council was conferred upon Radoslavoff, who was more friendly to Russia, but still an advocate of Bulgarian independence, as was also his radical colleague, Theodor Ivanchoff.

In reply to inquiries from the provisional government, the St. Petersburg Cabinet declared that it would sustain the regency so long as the interests of the whole country were observed, and peace and order maintained; that Russia was opposed to the election of a new prince until the complete return of tranquillity; that Russia was prepared to promote the union of the two Bulgarias, but not in the present violent form; and that the establishment of good relations between Russia and Bulgaria depended upon the provisional government, and upon its repairing its past mistakes. The regency appealed to some of the powers for recognition in order to constrain Russia to follow the other treaty powers in such an act, but received the answer from Italy that, as the legal depositary of the executive power, it needed no special recognition.

The Russian Government expressed the intention of sending a commissary to Bulgaria, but refrained from so momentous a step, and dispatched instead, as its diplomatic agent, Gen. Kaulbars, a brother of the former Russian Minister of War in Bulgaria.

The Sobranje met on September 13, and adopted an address to the Czar, expressing the deep attachment of Bulgaria. In the answer to the address of the regents, the deputies declared that the crime of August 21 should be treated as an act of treason against the independence of the nation and against the crown of the beloved Prince Alexander, and expressed gratitude to the prince for his magnanimous abdication in order to restore cordial relations with Russia. In the election of a president the adherents of the Zankoff party numbered only 13 of the 200 members present.

A bill was passed, with practical unanimity, to purchase the property of Prince Alexander in Bulgaria for 2,500,000 francs, which would discharge the debts he had incurred to keep up his state, and yield him considerable sum besides; but the surplus was eventually declined. The Sobranje separated on Sept. 18.

On the 19th of September the Russian consul

delivered a note to the Bulgarian Government demanding a postponement of the trials of officers and others who had been arrested for complicity in the state-stroke of August 21, until a calmer state of public feeling existed.

The Mission of Kaulbars.—Gen. Kaulbars arrived in Sofia on the 25th of September. The Government appointed the 10th of October for the election of the Great Sobranje summoned to choose a new prince. The regents and leading politicians were at first in favor of re-electing Prince Battenberg, in accordance with the general desire of the people, but gave up the idea out of regard for the sentiments of the Czar, and because it was certain the choice would not be acceptable to all of the powers.

Baron Kaulbars placed himself in antagonism with the Government from the time of his arrival. He demanded that the processes begun against the officers who had participated in the abduction of the prince should be discontinued, and the prisoners set free; that the state of siege should be revoked; and that the elections to the Great Sobranje should be indefinitely postponed. He issued a circular to the Russian consuls, in which he accused the Government of suppressing a telegram from the Czar, condemned the burning of the flag of the mutinous Strunsky regiment, and contested the right of the courts to proceed in the trial of the officers, because the members of the Government belonged to a hostile party.

He said, in this circular, that the Czar expected all Bulgarians to turn to him with perfect confidence as their only deliverer; that the time for empty words and declarations had gone by, and he looked for acts by which Bulgaria should prove, in an unquestionable manner, her devotion, and then only would he deign to further her progress internally and externally.

The ministers informed Gen. Kaulbars on October 1 that the Russian demands with regard to the state of siege and the persons arrested on account of the *coup d'état* were accepted, but that they could not agree to a postponement of the election, which was fixed for October 11. The order restoring the ordinary law had already been issued the day before. Kaulbars declined to accept the dispatch because it was not clear enough, whereupon the ministry sent another note, declaring that the Bulgarian Government desired to follow the counsels of Russia, but only so far as the laws of the land permitted. The Bulgarian Constitution requires an election of a Great Sobranje within a month after the throne becomes vacant; but the Russian agent argued that regard should be had to the extraordinary conditions, and that the election of a prince would be useless until the powers had agreed on a candidate. The arrested officers were set free on October 4, with the exception of seven of the principal conspirators.

The Russian consul in Philippopolis was ordered by Gen. Kaulbars to distribute litho-

graphed copies of his note announcing the demands of Russia among the people; but the prefect of the city, Dimitroff, forbade their circulation, and took measures to prevent it. In a public meeting in Sofia a Russian agent shouted, "Long live the Czar! Perish Bulgaria!" and was roughly handled by the citizens. Gen. Kaulbars then appeared, and attacked the Government in a violent speech, but his words were drowned. Leaving Sofia under instructions from the Czar to investigate the state of feeling throughout Bulgaria and Eastern Roumelia, he traveled through the country, endeavoring by addresses and circulars, and by secret incitement and bribery, to foster among the people resistance to the decrees of the Government, and foment mutiny in the army. He sent a letter to the commandant of the garrison at Rustchuk, urging the release of the officers held in custody there; but that officer replied that his demands should be addressed to the Government. In every garrison town he summoned the officers to a consultation on his arrival; but they declined such interviews, as being inconsistent with their duty. Three regimental commanders in Shumla sent a protest to Stambuloff, advising the acceptance of the Russian demands; but, on receiving a sharp reprimand, promised to abstain from political discussions. The Government used stern measures to insure obedience, and to repress the agitation that Russian agents sought to provoke.

The rigorous application of military law offended the people, but not so much as the unusually strict collection of the taxes that the ministry ordered, in order to relieve the embarrassments of the treasury. The Zankoff party spread the belief among the farming class that under Russian rule taxes would not be so rigorously collected, and that money would flow into the country and be much more plentiful.

The Russian general was greatly disappointed in the strength of the Russian party. A small knot of adherents of Zankoff met him in each town, but nowhere did he receive the semblance of a popular welcome, except from some small deputations of peasants, and from Macedonian and Russian supporters. Montenegrins and Macedonian adventurers flocked to the Russian consulates in the Orient, during turbulent times, when money can be earned by creating disturbances or organizing insurrectionary outbreaks. The Montenegrins are engaged by the consuls as *cavasses*, and inspire fear and respect among the people by their martial air and the many weapons that they carry, in accordance with their national custom. The demonstrations of peasants in Rustchuk and other places, that Kaulbars represented as showing the true state of feeling in Bulgaria, were arranged and conducted by hired agents, none of whom were Bulgarian.

The proceedings of Gen. Kaulbars were viewed with wonderment throughout Europe.

Lord Iddesleigh, the British Foreign Minister, sent a circular note to the powers, asking them to extend their moral support to the Bulgarian Government. The ministry addressed a circular to the representatives of the powers, remonstrating against foreign interference with the elections. Consul Nekliudoff, in Sofia, refused to accept the note in the absence of his chief, protesting against its import, and declared a rupture of diplomatic intercourse.

The Elections.—The Opposition party was given no opportunity to arrange an election campaign. In the provinces the state of siege though nominally ended, was still practically maintained. The Government party distributed everywhere a manifesto, appealing to the electors to vote for men who were Bulgarians first, and Slavs afterward; who would choose a prince willing to die for Bulgaria on the battle-field, and was her hero-prince; and thus show that Bulgaria will live free and independent, and not bend anew to the yoke.

The elections passed off quietly, except for attempts of Russian emissaries in various places to create riots. In Sofia, Nekliudoff arranged, or at least countenanced, a plot to prevent the election. Forty or fifty peasants were hired in the neighboring villages. They made their rendezvous at the Russian consulate, where they were joined by a band of Montenegrin bravoes, who had been brought direct from Montenegro. Nekliudoff made them a speech, in which he said that the elections were disapproved by the Czar, and would be null and void. They were then marched by their Macedonian and Montenegrin leaders to the polling-place. There they stoned the people, and attempted to burst in the door, and destroy the urns; but in the fight that followed, they were put to flight by the citizens, and took refuge in the yard of the Russian consulate. A mob gathered about the gate and jeered at the peasants. This led to the throwing of sticks and stones, and, although the police drove the people back, the peasants soon began again to hurl fire-wood, and were answered with a volley of bricks. The Montenegrins, who were claimed by the Russian agent as regular *cavasses* of the consulate, then fired off their revolvers, and the bullets went into the German and English consulates opposite. Soldiers then cleared the streets, and conducted the peasants, whom the Russian consul now ordered away, outside the town. In Widdin, a group of about fifty peasants, who assembled before the Russian consulate, to protest against the elections, were dispersed by the police. In answer to the complaint of the Russian consul, the prefect stated that they were not Bulgarians, and had no right to assemble on election-day. In Eski Sagra, a soldier of the garrison named Bahov Ivanoff, was arrested, who confessed that Schachotin, the Russian consul in Rustchuk, had employed a certain Montenegrin *voivode* to organize bands that were to set out on Oct. 17 and raise disturb-

ances in different parts of the country, with the object of hastening a Russian occupation. In Dubnitsa, on the Macedonian frontier, a riot occurred, during which the sub-prefect and both of the Government candidates were murdered. In Vratza, Zankoff partisans prevented the election from taking place by force; and in Bela Slatina, by spreading a false report that the Government had postponed the elections. Before the elections, it was generally believed that proofs of Karaveloff's complicity in the plot to kidnap the prince existed in the hands of the authorities, yet he still remained a member of the regency, though holding but little intercourse with his colleagues. He was excluded from the list of Government candidates for Sofia, and on an independent ticket received scarcely any votes.

Treaty of Friendship with Servia.—During the crisis, the Servians as well as the Roumanians manifested a strong interest in the independence of Bulgaria, and a desire was shown in Servia to resume friendly relations with Bulgaria. The regents nominated Dr. Strausky as diplomatic agent in Belgrade. The Servian Government made no objection to his person, notwithstanding the part he had played in the Roumelian revolution, but said that it would welcome him as a commissioner to arrange certain difficulties, before all, the Bregovo question, preliminary to re-establishing regular diplomatic intercourse.

On Oct. 25, Dr. Strausky arrived at Belgrade as the Bulgarian diplomatic agent, and the same day an agreement respecting the resumption of diplomatic relations was signed. Since the war, there had been no commercial or postal intercourse between Servia and Bulgaria. The agreement contained the following stipulations: (1) The Bregovo question to be referred to a joint Servo-Bulgarian delimitation commission; (2) a treaty of commerce to be concluded within six months; (3) Servian refugees in Bulgaria to be removed to a distance of sixty kilometres from the frontier; (4) the Vakarel-Sofia-Zaribrod line of railway to be constructed as rapidly as possible, and the line from Nish to Pirot also, if practicable. Gen. Kaulbars informed the Servian Government that the diplomatic relations with the regency would not be recognized by Russia.

Russian Menaces.—After the elections diplomatic negotiations were resumed. The Russian agency transmitted a note from Gen. Kaulbars protesting against the complaint of the interference of foreigners in the elections, and delivered two other documents, one complaining of an attack on the Russian consulate, the other declaring the election of the Great Sobranje illegal.

Gen. Kaulbars returned to Sofia on Oct. 22. He refused to accede to the proposition of the regents that the powers should agree on a candidate within two weeks on condition that the meeting of the Sobranje should be postponed that length of time. Gadban Pasha on the 22d

presented a note from the Grand Vizier, requesting a postponement until Turkey could negotiate with Russia regarding the choice of a prince. The Turkish Government, influenced by Russian representations, objected to the meeting of the Sobranje, because the validity of the elections was contested. The Bulgarian Government on Oct. 23 addressed a circular to the powers announcing that the Great Sobranje would meet in Tirnova on Oct. 31, and proceed immediately to the election of a prince. The Turkish commissioner was informed that, if he doubted the legality of the elections, he might convince himself by attending the sittings of the Assembly.

On the 25th of October two Russian war-vessels anchored in the roadstead of Varna, ostensibly to protect the consulate and Russian subjects, according to the explanation given by the Russian Government to the great powers, though at the same time the Bulgarian Government was informed that the demonstration was intended as a protest against the convocation of the Sobranje. Baron Kaulbars announced that the execution of the officers arrested for the plot of Aug. 20 would be followed by immediate action on the part of Russia. On Oct. 28 the state of siege was proclaimed by the Bulgarian Government, on account of the attacks of the opposition press, and of a plot to overturn the regency, and set up a ministry under Zankoff. The Russian Government ordered all the steamers on the Black Sea to be in readiness to transport troops, of whom there were 40,000 ready to embark. Baron Kaulbars announced that sailors would be landed from the Russian frigates at Varna, of which there were now three, and informed the regents that if opposition were offered the town would be bombarded. On the 28th he delivered an ultimatum, declaring that if the authors of certain outrages on Russian subjects were not punished he would leave Sofia and break off diplomatic relations. The Bulgarian minister, Nachevich, asked the names of the offenders, but he answered he was not a detective.

On Oct. 31 the regency yielded to the Russian menaces, to the extent of releasing all the officers who were concerned in the plot to abduct the prince. Kaulbars demanded to know if the authors of a recent plot against the regency, for which two Russians and ten Montenegrins, with their Bulgarian accomplices, had been arrested, were included in the amnesty. It was the officials concerned in these arrests whose punishment he demanded.

The conduct of Gen. Kaulbars and the military preparations in the Crimea indicated that the Czar, who was known to have taken the management of the Bulgarian difficulty entirely out of the hands of M. de Giers and to be conducting it directly through Baron Kaulbars without regard to diplomacy or public law, was determined to forcibly intervene in Bulgaria. The German Government interfered to dissuade him from precipitate action. Their represen-

tations and the counsels of Russian statesmen deterred him from an attempt to subjugate the Bulgarians, whose ingratitude so incensed him. After Russia had sacrificed many thousands of her soldiers, had spent 8,000 francs for every Bulgarian, and burdened herself with a vast debt to liberate them, Alexander could not see how they could weigh their prince, or their Constitution, or their independence, against his wishes and the demands of Russian policy. The Porte through its agent at Sofia continually urged the regency to submit to the demands of Russia, in order to avert the occupation of the Roumelian seaports. It had been appealed to for suggestions as to the choice of a prince, but refrained from indicating a candidate, and in all questions showed entire compliance with the wishes of the Russian Government.

Russia received a distinct warning from Austria at the opening of the Delegations, when Count Kalnoky said that an occupation of Bulgaria of any kind would be a grave injury to the vital interests of the Hapsburg Empire, which did not wish peace at any price, and in the event of a conflict would not stand alone. The alliance with Germany, he explained, did not bind either empire to defend the separate interests of the other; yet mutual interests constitute the base of the alliance, and the continuance of each country as a strong and independent power forms for both an important interest. This declaration followed Lord Salisbury's exposition of British policy at the Guildhall banquet, where the English premier said that England had no isolated interests in maintaining the freedom of Bulgaria, yet she had a corporate interest, and would join the other powers, or any considerable portion of the powers of Europe, if an occasion should arise for vindicating the Treaty of Berlin, and that the opinion and judgment of Austria in this matter would have enormous weight in the counsels of the British Government. This presage of a military and financial alliance between England and Austria-Hungary was echoed by Count Kalnoky, who said, "England will be on our side if it should become necessary to defend the state of things created by the Berlin Treaty."

Attempted Insurrection at Burgas.—The Eastern Roumelian port of Burgas was the scene of an attempt of Russian agents to raise a revolt against the regency on Nov. 4. Capt. Nabokoff, a Russian officer who had been prominent in the conspiracy against the prince, placed himself at the head of a band of Russians and Montenegrins, who were joined by Lieut. Kisheneff and some of the soldiers of the garrison. They seized the prefect, mastered the Bulgarian soldiery, took possession of the public buildings, and proclaimed the sovereignty of the Czar. Bulgarian troops, from the neighboring towns of Aitos and Karnobad, conducted by Capt. Karavanoff, the commander of the Burgas garrison, who had made his escape, quickly arrived on the spot, suppressed the

revolt, put the raiders to flight, and reinstated the authorities. A simultaneous plot at Philippopolis was checked before the occurrence of any disturbance. The ringleader, a Russian named Novitzki, was arrested with damaging papers in his possession, implicating Kovandjeff, the dragoon of the Russian consulate, and Popoff, who was formerly in the employ of Aleko Pasha. Risings in other places were put down without difficulty. Nabokoff was arrested in the Aitos district, while collecting a force to lead against Philippopolis.

The Great Sobranje.—The National Assembly was opened on Oct. 31. Stambuloff and Col. Mutkuoff were present, and the former read the opening speech, which concluded with the words, "Long live free and independent Bulgaria!" Karaveloff, whom the deputies had threatened to remove from the regency, remained in Sofia, and was in confidential communication with the Russians. Among 450 deputies there were 78 Zankoffists. In spite of the protests of the Porte, deputies from Eastern Roumania sat and voted in the Assembly. On Nov. 10 Prince Waldemar of Denmark was elected Prince of Bulgaria by acclamation. A deputation of five members of the Sobranje started for Cannes, where the Danish prince was, to formally offer him the crown. The same day Karaveloff, after having protested against the election of a prince, sent his resignation as regent. Prince Waldemar announced that he had referred the question as to his acceptance of the proffered crown to the decision of his father. The King of Denmark telegraphed on Nov. 13 that he could not allow his son to accept the election to the throne. At a meeting of the Sobranje held after receiving this message the regents Stambuloff and Mutkuoff offered their resignations. The house refused to receive them, but accepted Karaveloff's by acclamation, and elected Zivkoff, the President of the Sobranje, in his stead. Karaveloff, who had, when prime minister, enjoyed unbounded popularity as the leader of the movement for national independence, but who deserted the cause of the prince immediately after, if not before, the latter's abduction, and now identified himself with the Russian party, was denounced as a traitor in a resolution of the Assembly. After appointing a deputation to visit the different European courts, the Sobranje adjourned.

The Russian Choice for Prince.—The separation of the Sobranje, and the refusal of the Czar's brother-in-law to accept the Bulgarian throne, brought the question again into the range of diplomatic action. Germany and Austria invited Russia to indicate a candidate whom she would favor for the vacant throne. The Russian Government proposed Nicholas Davidovich Dadian, Prince of Mingrelia, a descendant of a distinguished Caucasian family, a Russian subject, and the son-in-law of Count Adlerberg, the household minister and intimate of the late Czar. Germany offered no opposition to this

choice, but objections were raised by England, and in Bulgaria such a candidate was strongly disapproved by the popular party.

Departure of Kaulbars.—Notwithstanding the protests of the Russian agent, the state of siege was again proclaimed at Sofia, and, after the Bourgas affair, at Philippopolis and other places. On Nov. 14, Gen. Kaulbars declared the trial of the Bourgas conspirators null and void. Capt. Nabokoff, the officer of the Russian army who, in the Czar's uniform, led the attempted insurrection, was tried and condemned to death by court-martial, and then handed over to the Russian authorities. Another complaint was raised about a Russian *cavass* that had threatened a constable who demanded his name and passport with a pistol, and was arrested, but given up to the Russian consul when it was known who he was. Gen. Kaulbars again threatened to leave Bulgaria, with all the Russian consular officials, if the police commissioner of Philippopolis were not dismissed on account of this alleged indignity. On Nov. 19, after confiding the protection of Russian subjects to the German consul-general, Kaulbars left Sofia and went to Constantinople. In his note to the Bulgarian Government, announcing his departure, he said that the Government had rejected Russia's counsels, which were intended to extricate Bulgaria from her difficulties, and had continued its insolent attacks on Russian subjects; and that, as Bulgaria had lost confidence in Russia, his further presence was useless. The departure of the Russian agent was not intended as a prelude to armed intervention, such as was intended when he before threatened a rupture, but was the consequence of the abandonment of the military policy in the face of the firm attitude of Austria, supported by Germany, in her resistance to the occupation of Bulgaria, and having the diplomatic support of Italy also, and the offer of a British alliance.

In the beginning of December the Porte urged the Bulgarian Government to accept Prince Nicholas of Mingrelia as the only means of pacifying Bulgaria, admitting that the regency must maintain order, but advising the regency to close the door to eventualities that might arise so long as there existed an opposing element. The regency replied that Bulgaria would never accept the Prince of Mingrelia, but that a new Great Sobranje would be called if the Porte would propose a suitable candidate for the throne.

BURMAH, a country in Farther India, formerly the independent kingdom of Ava, as it was officially styled, annexed to the British Empire on Jan. 1, 1886, by the following proclamation, issued by Lord Dufferin, Viceroy of India:

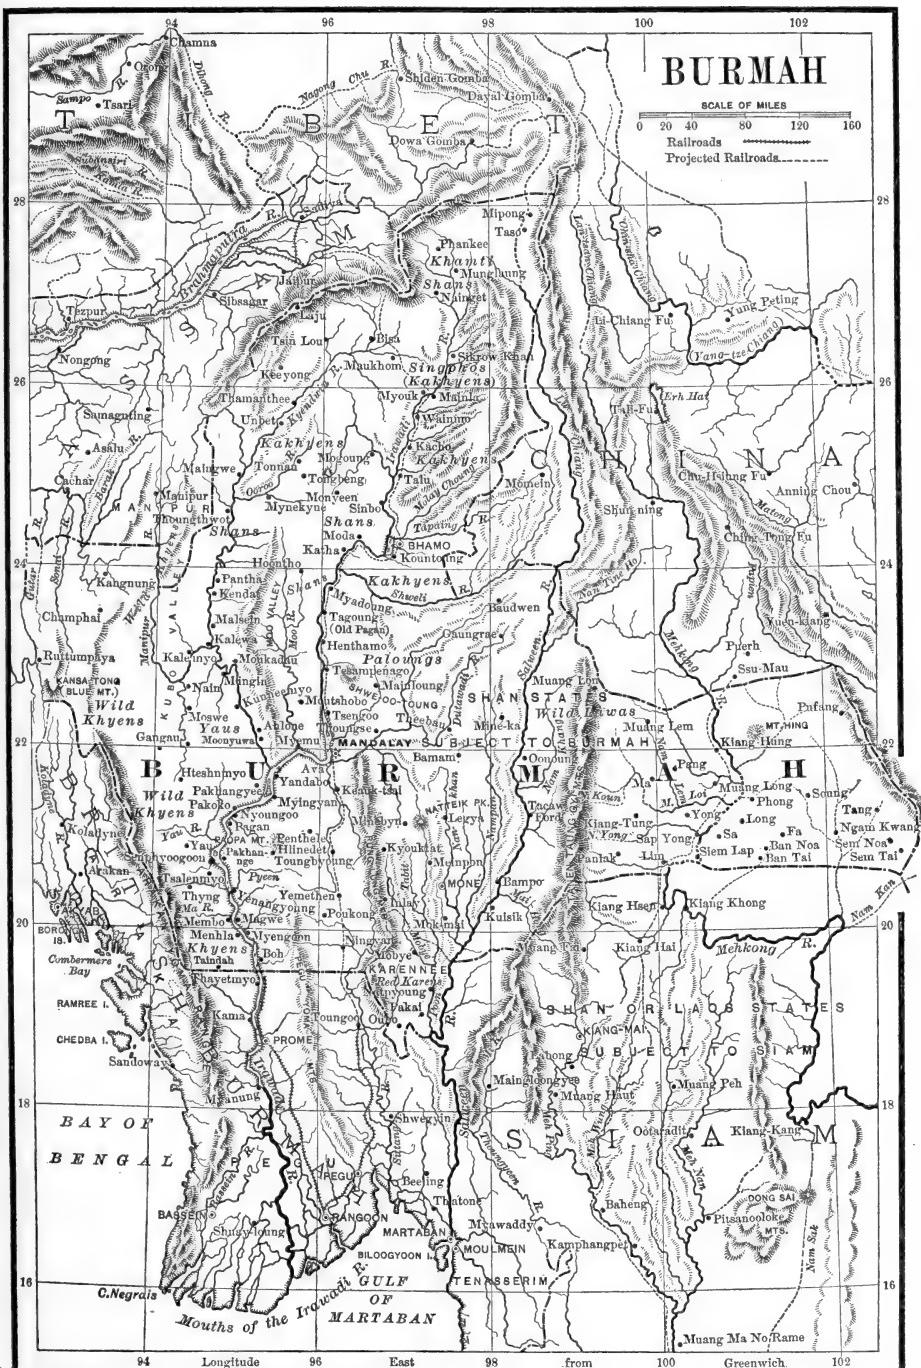

"By command of the Queen Empress, it is hereby notified that the territories formerly governed by King Thebaw will no longer be under his rule, but have become part of her Majesty's dominions, and will, during her Ma-

jesty's pleasure, be administered by such officers as the Viceroy and Governor-General may from time to time appoint."

Thebaw Min, the last King of Burmah, was born in 1858, and succeeded to the throne in October, 1878, after the death of his father, Mindoon Min, who drove his brother, Pagan Min, from the throne in 1853. Thebaw, after he was taken prisoner by the British in November, 1885, was assigned a residence in India, where he is interned.

Government.—The system of government in Burmah has been a pure despotism. The revenues were at the absolute disposal of the monarch. The ownership of all the land was either vested in the crown, or had been bestowed on favorites of the King. There was a Privy Council, called the Byadeit, consisting of four Atwen-Woons, who advised the King privately, and discussed questions before they were presented to the Hlootdaw, or public ministry. The latter consisted of four Woon-Mengyees, who held their deliberations under the presidency of the King or the crown-prince, in open meetings before the public. Four assistant ministers, with a multitude of secretaries and subordinate officials, conducted the administration at the capital under the orders of the Hlootdaw, which possessed supreme judicial, as well as executive and legislative, functions. The kingdom was divided into provinces, ten in number, over each of which presided an Hkhay-in-Woon, or umbrella-bearing chief. Woondouks administered the districts of these provinces, Woons the subdivisions of the districts, and Myo-okes the townships. These officials of various grades exercised judicial as well as administrative authority.

Area and Population.—The area of Independent Burmah has been estimated at 190,000 square miles, and the population at 4,000,000. The Burmese, as distinguished from the Karens, Sachyens, Shans, and Chinese settlers, are supposed to number not over 1,000,000 souls. They are a mixed race, sprung from Mongol hunter tribes from the north, Chinese colonists, Pelugu immigrants, and Malayans. They have the facial type of the Chinese, and in other physical characteristics resemble the Malays. They are an active, lively people, fond of athletic games, brave and energetic, but too much devoted to pleasure for continued labor. The condition of the poorer classes has deteriorated during the reign of Thebaw, who, however, kept opium out of the country, and saved his people from the vice which threatens their kindred in British Burmah with total ruin and extinction. The women mingle freely with the men, and exercise an influence in business and in public affairs fully equal to that of the stronger sex. The Burmese are good-natured, generous, and hospitable, but all classes show a singular disregard for human life and indifference to scenes of cruelty and suffering. Those of official station develop arrogance of character, duplicity,

and rapacity. The magistrates and governors often condemn persons to torture or death without a hearing, and have been such merciless extortioners, especially in recent times, that the people are reduced to wretched poverty, and have little motive for industry. The people of the lower ranks are remarkably honest and truthful. Owing to an excellent climate the Burmese are robust, and attain the normal length of life. The deaths of children under five years of age form a much smaller proportion of the total number of deaths than in Europe, being less than 28 per cent. of the deaths at all ages. Polygamy has been abolished during the reign of Thebaw, though still existing in a disguised form. Slavery is also legally prohibited, yet not suppressed. The people are divided into seven classes, viz., the princesses and princesses of the royal house; the official class; the land-owners; the phoongyes, or Buddhist priests; the farmers; the coolies; and the outcasts. Buddhism is the religion of all, except the savage Shans, who are spirit-worshippers. The Karens have a legend of having deserted their god and lost their birthright, and believe in a prophecy that through white strangers from the West they will recover their religion, their national unity, and the high state of civilization they enjoyed before they were driven to wander from their original country over wide deserts. This accounts for the extraordinary success that American Baptist and European Roman Catholic missionaries have met with among them.

The Burmese regard their king with a peculiar religious devotion. They can conceive of no social system according to their religion without a king, who has passed through stages of existence raising him to a vastly higher plane of being than their own. This feeling is not directed toward the person of the King, nor even to the dynasty. The English in abolishing the Burmese king offended the people of British Burmah scarcely less than those of the kingdom, and provoked risings even in their own provinces, where civil order had long prevailed. The extravagant titles given to the Burmese King indicates the reverence in which his office is held. He is styled king of sea and land; lord of the rising sun, who rules over Sunnaparan, Zampodepa, and all the umbrella-bearing chiefs of the Eastern countries; master of the celestial royal elephant; lord of many white elephants; lord of gold, silver, rubies, and amber; the supporter of religion; the sun-descended monarch; light of the world; star of the earth; sovereign of the power of life and death; arbiter of existence, and great chief of righteousness; lord of the golden palace; king of kings, and possessor of boundless dominions, and of supreme wisdom. The people in the populous valley of the Irrawaddy, who were accustomed to the sight of strangers, viewed the invasion of the British with apathy, and were not displeased that their oppressive rulers should be overturned, though they knew

that they must come under British rule in some form. When they learned, however, that no prince of the royal house was to reign in the place of Thebaw, the whole population rose against the invaders.

Natural Resources.—Upper Burmah possesses an exceedingly fertile soil, capable of producing maize, wheat, millet, rice in the lower valley of the Irrawaddy, potatoes, cotton in all parts of the country, and luxuriantly on the dry lands of the upper provinces, tobacco, mustard, indigo, and in the north tea, which is indigenous. Fruits are abundant; sugar-cane is grown easily, but palm-sugar is the only kind made in the country, the cane being used only for munching. Gums and oils are found in the forests, and caoutchouc-trees are numerous in the districts of Bhamo and Mogoung. The most important article of export is teak-wood, which predominates in the mountain forests. The country is remarkably rich in minerals. Besides rich rubies and sapphires, mines of which have long been worked, jade of fine quality is exported. There are also quarries of serpentine. About 60 miles from the frontier of British Burmah, on the left bank of the Irrawaddy, is an oil-field, covering 16 square miles, in which about 300 petroleum-wells are in operation, varying in depth from 200 to 300 feet. There are silver-mines worked by Chinese, and gold is found in the sands of the streams in the upper country. Lead, tin, antimony, copper, bismuth, niter, amber, salt, and marble exist in the mountainous districts, most abundantly in the Shan states. There are deposits of magnetic iron-ore on the Myit Nga, a navigable river flowing into the Irrawaddy near Mandalay. Large deposits of coal are found, and have been worked to a small extent.

Commerce.—Formerly there was a considerable transit trade with China, but it has fallen off. The foreign commerce is chiefly with Lower Burmah, Bengal, the Asiatic Archipelago, and European countries. It all passes through Lower Burmah. The imports consist of rice, cotton and woolen fabrics, silks, salt, metals, pickled and dried fish, and European manufactures. The imports from British Burmah were valued at 14,858,860 rupees in 1882; 15,810,790 rupees in 1883; and 18,261,140 rupees in 1884. The exports, not including teak-wood, were valued at 13,033,750 rupees in 1882; 16,706,820 rupees in 1883; and 17,058,480 rupees in 1884. They consist chiefly of petroleum, niter, lacquer-ware, hides, cutch, sesamum-seed and oil, cotton, raw sugar, grain, jade, and tamarinds.

The Revenue.—The receipts of the royal treasury in the reign of Thebaw were estimated at from 85 to 105 lacs of rupees. There were a house-tax, a poll-tax, and taxes on agriculture, fruit-trees, sugar-palms, tobacco-land, teak-forests, salt, fisheries, etc. The British authorities on assuming the administration, proposed to abolish the customs

duties, yielding 15 lacs, the transit dues, amounting to 9 lacs, and the monopolies producing 6 lacs, which latter loss would be made good by the imposition of stamp duties. The expenses of the military expedition, amounting to 40 lacs, were made a charge upon the Indian revenue, after considerable discussion in the British Parliament. The Indians themselves unanimously opposed the conquest, and afterward the annexation of Independent Burmah, and protested against being made to pay the cost of the war. The military expenses of 1886 swelled the amount to many times the cost of the expedition. The administration endeavored to keep the expenditures within the limit of the revenue from the conquered country, but, when obliged to abandon a blundering policy of false economy, changed the basis of calculation, and promised that the expenditure would not exceed the revenue of the newly annexed province and the surplus revenue of British Burmah.

History.—The Burman state owed its rise and growth to the boundary disputes between its powerful neighbors, China, Siam, and Pegu, and, when threatened by either of them, received assistance from the others. After Pegu had conquered Burmah, in 1758, a partisan leader named Alaungpra, the founder of the present dynasty, recovered the national independence, with English assistance, and subjugated Pegu. After the conquest of Assam, Aracan, and Manipoor the Burmans imagined themselves invincible, and attacked the territory of the East India Company. On March 5, 1824, the British declared war, and in the following May landed 6,000 men, under Sir Archibald Campbell, in Pegu, and occupied Rangoon. The English troops suffered from various epidemics, losing 72 per cent. of their numbers, and were valiantly opposed by several Burman armies, but after two years they overcame all resistance, and were marching upon Ava, the capital, when the King made terms of peace, giving up the provinces of Aracan, Tenasserim, and Assam, and paying an indemnity of five crores of rupees. He also agreed to receive an English resident in Ava. Such is their superstitious belief in the might of the King, that the Burmans to this day believe in the truth of the proclamation issued by the King, which said that because the strangers were exhausted and perishing, he let them remain in the country, and gave them money to pay their expenses. In 1852, provoked by the arrogance of Pagan Min, then King of Ava, the British again declared war against Burmah, and secured the Siamese as allies. Even after the British troops had overrun the whole country, and captured the capital, the King would not sign a peace, but only declared through an envoy that he would not disturb the English in the province of Pegu, which Lord Dalhousie had annexed by proclamation, if they would cease hostilities. This third province in Lower Burmah united those previously acquired, and

shut off the kingdom entirely from the sea. After their former defeat the Burmans had transferred their capital from Ava to Amarapura. Now a new royal city was erected near Ava, but at a distance from the river, in order to be beyond the range of English gunboats. Pagan was deposed because he would not make peace with the English, the popular War Prince passed over, and Mindoon made king. The Indian Government has since then endeavored in vain to induce the King of Ava to abolish the royal monopolies that hamper trade, to accept the frontier claimed by the British, and to receive the British resident as an equal, and not compel him, like all other persons, to remove his shoes and assume a crouching attitude in the royal presence. In 1867 the entire course of the Irrawaddy was opened to navigation; but fearing that the people in the northern province would emigrate into British Burmah in masses, as had the inhabitants of the southern districts, the King forced the Chinese merchants to transport their goods over the difficult southern route, through Theini and Thebaw, to Mandalay, instead of holding market, at Bhamo, as formerly. In 1875 he gave up his pretensions over the southern Karens, but took no part in the demarcation of the boundary, which was carried out the following year by the Indian authorities alone. The closing of the Bhamo route interfered with the English export trade with Yunnan. The difficulty with China, after the murder of Margary on the frontier of Yunnan, and the quarrels with the Burman Government, and disturbed state of the country almost put an entire stop to this profitable trade for some years, but recently it has been resumed by the Bhamo route. The English expected to force their views on the shoe question upon Thebaw when he came to the throne, and accordingly the resident received instructions in 1879 not to appear at court unless allowed to wear his shoes and stand erect. The Burmese Government retorted by forbidding Europeans to enter the palace buildings. Many Europeans, among them the English resident, were subjected to insults in the streets. In September, 1879, Mr. Sladen, the British representative, was recalled, the Italian consul undertaking to care for the interests of British subjects; and since then there has been no British representative at the court of Ava. Thebaw and his ministers, although firm on the shoe question, because it would have offended the moral and religious sensibilities of the people to have the sun-descended monarch approached like an ordinary mortal, were very desirous not to offend the British, and in order to restore friendly relations and explain the situation sent an embassy to the Viceroy. Their envoys, however, were refused an audience at Calcutta.

The Royal Family.—It has been the custom among the princes of the Alaungpra dynasty to have many wives and concubines. The heir-apparent marries for his principal wife the

princess of highest rank, who is usually one of his half-sisters. The kings have always had large families. Mindoon had as many as 110 children, of whom 72 were alive at the time of his death, while of his 53 recognized queens 37 survived him. When he was placed on the throne by the peace party, the War Prince, who was the rightful heir, retained the title of crown-prince, with the understanding that he or his issue should succeed to the throne, to the exclusion of the sons of Mindoon. To overturn this arrangement, Mingoon and Min-goon Deing, the eldest sons of Mindoon, originated a rebellion in 1866, in which the War Prince was slain, and the king had a narrow escape. The princes were finally routed by the royal forces, and escaped to India, where they were detained as political prisoners. Min-goon's brother died there, and he himself finally escaped to Pondicherry, where he has since been a pensioner on the French Government, and has acquired European habits, knowledge, and modes of thought, and a high respect for French civilization. Thebaw, who was Mindoon's son by an inferior queen, a Shan princess, was raised to the throne by a palace intrigue, concocted by the principal queen and Tinedah Mengyee, then captain of the palace guard. He was to have married both daughters of the first queen, but the elder one fled to a monastery. The younger princess, Soopayalat, was for a time his only queen, a circumstance that excited the contempt of the Burmese, who saw that the young King was governed by his wife and mother-in-law, and would have preferred to be ruled by a more energetic prince, and by one who followed the polygamous customs of his ancestors. Though he took a second queen subsequently, in order to please his subjects, Soopayalat retained her dominion over him. On the accession of a new King the members of a rival faction in the royal family are sometimes murdered or thrown into prison, and such massacres are approved of by the people, because they thus escape the evils of palace revolutions and dynastic wars. When Thebaw ascended the throne, a massacre took place, the victims of which are said to have numbered 72 princes and princesses of all ages. Among those who escaped was Nyung Yang, who, like the Mingoon prince, came before Thebaw in the order of succession. He took refuge in Calcutta, and, soon after the rupture between the Indian Government and the Court of Ava, he appeared on the British frontier of Burmah, raised a rebel army, and for two months was successful against the forces of Thebaw, but toward the end of June, 1880, was thoroughly beaten. He returned to Calcutta, and was detained thereafter as a prisoner of state. His death, about the time of the Burman expedition, left no candidate for the throne of Thebaw sufficiently near to the direct line of succession to be generally acceptable to the Burmans, except the Mingoon prince, whom the British would not trust on account

of his French education. They therefore decided on annexation instead of a protectorate.

Relations with France.—After Lord Dalhousie annexed Pegu, and shut off Independent Burmah from the seaboard, he declared that he held the remainder of the kingdom of Ava in the hollow of his hand. The Burmese statesmen have since that period shown much shrewdness and tact in their endeavors to prevent the inevitable absorption of their country by Great Britain. While guarding against the diplomatic efforts of the English to establish a protectorate by insidious encroachments on their independence, they have sought in recent years to gain an international footing by entering into relations with other European countries. These efforts were begun in the reign of Mindoon. In 1872 an embassy visited the courts of Italy, France, and England. In 1874 a second mission was sent to the same capitals, and in 1877 another, which also visited Madrid. Besides the English commercial treaty, dating from 1862, treaties were concluded with France, Italy, Spain, and Persia. In May, 1882, a Burman envoy was sent to Simla with an offer to receive a British resident, with his guard, provided the Indian Government would abandon its demands on the shoe question and that of the trading monopolies. In October, 1884, there was a mutiny in a Burman jail, in consequence of which 300 prisoners were killed, among them some British subjects. This event was the occasion of a clamorous agitation in favor of annexation among Rangoon merchants and Anglo-Indians of all classes, such as was constantly revived so often as any act was committed by the Burman Government or people that could be construed as an international grievance. In order to escape English domination the Burmese Government threw obstacles in the way of English trade, though contributing thereby to the impoverishment of its own people, but favored Italian, French, and other foreign traders in every way. The Anglo-Indian merchants and English manufacturers, who suffered from this policy, urged that the fact that the kingdom was misgoverned and disturbed by rebellions, and that Thebaw was, as they pictured him, a cruel monster, addicted to gin, given to horrible orgies, and probably insane, was a sufficient ground for conquering the country. The British Government kept the way open for intervention at any time, but was not disposed to act while it had the Egyptian and Afghan difficulties on its hands. Lord Dufferin, in a dispatch dated March 24, 1885, said that "hitherto our treaties have been on the whole respected, our commerce has received protection, and our officers have succeeded in maintaining friendly relations with the officials on the Burmese frontier districts." But he added that a change in the situation was being effected by the efforts of France to secure a footing at Mandalay, that would give her powers of interference with British commerce, and lead to political complications. M.

Haas, the French consul at Mandalay, with political as well as commercial objects in view, was at this time endeavoring to secure commercial privileges for French speculators, and did not scruple to hold out promises of French support to the Burmese ministers. Tangyet Woon was sent by the Burmese Government on a diplomatic mission to Europe. He concluded a commercial treaty with Germany, and a supplementary treaty embodying the same provisions with France. It gave the rights of free navigation and circulation, of trading wholesale or retail, of immunity from special taxation, of buying, possessing, and selling land and houses, and of directly dealing with the natives without the intermedium of the royal brokers, who have been the standing grievance of foreign trade in Burmah. Tangyet warned his Government against relying on France for political support. But Tinedah and the others who possessed the King's ear concealed the dispatches. Tinedah was virtually prime minister, though Kinwoon, an old Ming-ye, once an ambassador to Europe, and an advocate of peace and moderation, was his superior in rank. Consul Haas negotiated a convention with the Burman Government, giving French companies the privilege of establishing a state bank, a monopoly of railroad construction, a lease of the forests, and the collection of navigation dues on the Irrawaddy. This convention was reported to have been secretly accepted by the French Government, but M. de Freycinet, when interrogated in September, 1886, informed Lord Lyons that France sought no exclusive commercial privileges in Burmah. The extravagant tastes of the Queen were said to be the reason for bestowing valuable concessions for an insufficient consideration. Her demands for money are supposed to have led the Government to bring a charge against the Bombay and Burmah Trading Company, which had the monopoly of the teak-forests. The company was accused of removing 56,177 logs without paying the royalty. The Burmese court that tried the case was the Hloodaw, which decreed a fine of nearly \$1,250,000 against the company. It was rumored that M. Haas had promised to find French contractors for the forest leases, if the franchises of the British company should be annulled. Lord Dufferin, in his report of March 24, intimated that the Indian Government would soon be compelled to demand the admission of a British resident with an escort at Mandalay. He now embraced the quarrel of the Trading Company, and supported the demand to have the dispute referred to arbitration. In a letter to the Burmese ministry, dated Aug. 28, 1885, and signed by the Secretary to the Chief Commissioner of British Burmah, the Burmese Government was asked to suspend the judgment against the trading corporation, to submit the matters in dispute to an arbitrator appointed by the Viceroy, and to promise to abide by the arbitrator's decision. The Burmese ministry replied that

the case had been judicially investigated, and that the Government would not interfere with the execution of the law.

The British Ultimatum.—On October 22, E. S. Symes, the Chief Commissioner's secretary, dispatched a letter to the Burmese Minister of Foreign Affairs, refusing to accept the reply to the note of August 28, and making the following demands: 1, that an envoy from the Viceroy and Governor-General shall be suitably received at Mandalay, and that the present dispute between your Government and the Bombay-Burmah Trading Corporation shall be settled with his concurrence; 2, that all action against the Bombay-Burmah Trading Corporation shall be suspended until the envoy arrives; 3, that for the future a diplomatic agent from the Viceroy shall reside at Mandalay, who shall receive becoming treatment at the hands of your Government, and shall be supplied by the British Government with a British guard of honor and a steamer. The envoy and the permanent resident were to have free access to the King, and should not be required to submit to the obnoxious ceremonies of the court. The letter also contained the demand that the external relations of Burmah should be under the control of the Government of India, and required the Burman Government to grant facilities for opening up railway communications with China by way of Bhamo. Warlike measures were threatened in case the Burmese Government did not reply by the 10th of November with the unconditional acceptance of the first three requirements, and a general acquiescence in the wishes of the Indian Government on the other two subjects.

Kinwoon and the Queen's mother counseled the King to accept the English demands; but the war party prevailed. The reply to the British ultimatum was dictated by Tinedah, Athlayment Woon, and Kyung Mung Woon, the representatives of the Old Burmese party, and was pronounced unsatisfactory and hostile by the British authorities. The British resident, it was pointed out, had left Mandalay of his own accord, and the Indian Government had broken off diplomatic relations to the regret of the King, who would welcome the return of an English representative; yet no reference was made to the shoe question. The Bombay company was told to present an appeal to the King, and its case would be investigated. With regard to the British demand to control the foreign relations, the King replied that he must first consult Germany, France, and Italy.

Gen. Prendergast was prepared to move a hostile force up the Irrawaddy if, as was expected, the ultimatum should be rejected, while Col. Sladen, who had been the last British resident in Mandalay, was ready to proceed as special envoy to the court of Ava in the contrary event.

The British Conquest.—An army of 18,000 men, including camp-followers, was collected at Thayetmyo, the last British station on the

Irrawaddy, before the expiration of the ultimatum. A flotilla of steamers and floating batteries was organized by Mr. Bernard, the Chief Commissioner of British Burmah. Gen. Prendergast's force consisted of six British and eleven native infantry battalions, about 14,000 bayonets, one native mountain battery, and four garrison batteries of royal artillery, of which one was an elephant battery. The "Irrawaddy," a light-draught steamer, was heavily armed with two 25-pounder rifled breech-loaders, two Nordenfeldts, two machine-guns, and torpedoes. A steam-launch, the "Kathleen," had been armed and protected with 4-inch plates. The "Thamby-a-dine," a small steamer, was arranged for carrying the general and his staff. Four large barges had been fitted up as floating batteries, each with two howitzers throwing 60-pound shells. Another barge carried a broadside-battery of six howitzers, and, in her bow, two 40-pounders. Six iron steamers of the Irrawaddy Navigation Company were engaged as transports, and the flat-boats which, in ordinary times, are towed up and down the river freighted with merchandise, were prepared for the transportation of troops, with compressed cotton-bales at the sides as a protection against rifle-balls. The steamers were also crowded with soldiers. A naval brigade, five hundred strong, accompanied the expedition.

The Burmese Government had garrisoned the forts near the frontier with about 2,000 men. Italian engineers, who had been some time in the King's employ, had constructed a strong masonry fortress, called the Kuligon fort, opposite the town of Minhlā. It commanded the river for about two miles, and mounted ten guns, none of them of heavy caliber. The fort within the town of Minhlā, which had been much damaged by floods, was repaired for the emergency as well as it could be. Besides these fortifications, which were sixty miles from the frontier, there were none of consequence on the river excepting the Singon or Ava group, consisting of three masonry forts, a short distance below Mandalay. The Singon or Ava fort was to the west of Ava. On the opposite bank was the Sa-gaing fort; and above Ava, commanding the river for two miles, the Thalayidan fort.

The Italian engineers attempted, with much skill, to sink stone-laden barges with pointed posts in their bottoms and other obstructions in the Irrawaddy; but, owing to the shortness of time for preparation and to the great swiftness and depth of the current, it was impossible to effectually block navigation. River-torpedoes, bombs, and fulminate of mercury were manufactured by Italian workmen, under the direction of an engineer named Molinari.

King Thebaw issued a bombastic proclamation declaring that if the English barbarians, who were making war with the object of destroying the Buddhist religion and lowering the national honor, should attack any part of

his dominions, he would march against them in person, exterminate them, and capture their country. Still, the Burmese Government did not expect that the British would resort to an invasion, notwithstanding their warlike preparations. A steamer that had been detained by the authorities at Mandalay was sent down the river with a letter to the Chief Commissioner, urging that the steamers of the Irrawaddy Flotilla Company should resume their voyages, as their absence caused distress in Mandalay. The English expedition, the second day after starting, met this steamer, which had run the gauntlet of the Burmese river-batteries.

On crossing the frontier, Gen. Prendergast issued a proclamation, stating that in consequence of the violation of treaties, acts of aggression on the frontier, outrages on British subjects, injustice to British trade, and a foreign policy opposed to British interests, culminating in the imposition of a fine of ruinous amount on a British trading company, followed by an evasive answer to the British ultimatum, the Government of India had decided to send an armed force against Mandalay, and to depose King Thebaw. He promised that the private rights, religions, and national customs of the people, would be respected, and that the services of any who showed zeal in assisting the British, would be recognized.

The expedition started from Thayetmayo on Nov. 15, 1885. The same day the Burmese steamer "Irrawaddy" was captured from under the guns of a newly erected shore-battery, which was silenced by the guns of the British gunboat "Irrawaddy" and an armed launch. The Burmese vessel was engaged in placing obstructions in the river, and had on board the Italian engineers Molinari and Camotto, who swam ashore with the crew. The battery at this place, which is called Inlat, was reached by the expedition on the morning of Nov. 16. A force was landed below with the intention of capturing the Burmese troops by a rear attack, but, before the column came up, shells from the "Irrawaddy" that were too well aimed had put them to flight. A strong stockade at Sinbungway, on the opposite bank, was deserted at the approach of a detachment of infantry and artillery.

On nearing the Minhlā forts on the morning of the 17th, Gen. Prendergast landed with a large body of troops to take the formidable Kuligon fort in reverse. The ramparts were crowded with soldiers. The gunboats opened a heavy fire, but only one gun responded. Many shells burst over the fort, and still the garrison remained; yet, when the British troops entered at the northern gate, which was not even barred, they marched out at the opposite portal in regular order. The force that landed to attack Minhlā was composed exclusively of sepoys. As Kuligon offered no resistance, none was expected from the weaker fort on the western bank. But the Burmese were there strongly stockaded, and showed, as

they have in former wars, that they can defend their national style of fortifications, which they are able to construct with the utmost facility and rapidity, with great obstinacy, so long as their flank is not turned. The Indian troops had to carry three stockades before reaching the Minhla fort, against which the steamers directed their fire. They had no artillery, while the Burmese had seven light guns mounted on their stockades, the heaviest of them, as in the other forts, nine-pounders, but worked by men having some knowledge of gunnery, which was unusual among the Burmese. The Madras infantry advanced against the first stockade through a difficult jungle country, but a harassing rifle-fire on their flanks, and the single cannon that opened fire on the column caused them to hang back, until, encouraged by the officers, two of whom were wounded, they carried the stockade with the bayonet. The second stockade was taken without difficulty. The third and strongest one, mounting five guns, which were well served, was stoutly defended. The column was once on the point of retreating, but at length charged the works, one officer losing his life. The Minhla fort was defended by 500 troops from Mandalay, strong and well trained, but with little heart in the conflict. The officer who led the storming party was killed. When the sepoy's rushed in, the Burmese retreated down a staircase, and, as they were crowded together, were mown down by a murderous volley. When they issued from the gate, they encountered a Bengal regiment that poured volley after volley into the dense mass. Many rushed into the river and were shot in the water, until the officers stopped the slaughter. The 280 Mandalay men who were left were sent down to Rangoon. They belonged to the King's standing army, and have no occupation but fighting. The other Burmese soldiers, who are peasants in time of peace, were all paroled. When Kuligon was taken, the "Irrawaddy" and "Kathleen" moved up the river close to the western shore. As they approached Minhla, two masked batteries suddenly opened fire on them. A smart artillery duel followed. The Burmese worked their guns with great determination, although their range was very short. They were supported by a number of riflemen. The "Irrawaddy" and "Kathleen" replied to the rifle-fire with their Nordenfeldts. One of the batteries which fired on the "Irrawaddy" was placed in the fort at Minhla, which is surrounded and overlooked by houses. A shell from the "Irrawaddy" struck one of the houses near the fort, the town took fire, and was nearly completely destroyed. It burned fiercely for about two hours. The "Kathleen" had a narrow escape from destruction. After Minhla had taken fire and the Burmese were driven out of the fort, she approached the shore, and moored close to a barge fastened to the shore. The barge was suddenly

fired by a mine concealed in her, and blew up with a loud explosion, severely shaking the "Kathleen," but doing no other injury. The battle took place on the 17th. The expedition remained at Minhla two days, during which the floating batteries, with the naval brigade and steamers with troops that had been delayed, came up. A strong garrison was left at Minhla. The two Italian officers in the Burmese service came and surrendered themselves. When the flotilla started there were twenty-one large steamers.

The ascent of the river was slow and difficult. On the 19th, Magwe, a town of 9,000 inhabitants, was occupied without serious resistance by the naval brigade; Yaynankhyown, 22 miles above, on the following day; and two other towns were taken possession of and garrisoned before they came to Pagan on the 22d. Here a force of 1,500 was found in position; but they were driven out after a brief bombardment, and the fortifications were occupied.

No further resistance was encountered until reaching Mingyan, the principal trading-town between the frontier and Mandalay. There a large body of troops were drawn up around a stockade on a hill behind the town, out of the range of the ships' guns. Hlaythin Atwin Woon, or the Burmese admiral, their best general, was in command. Along the banks were two batteries, mounting nineteen guns, and a series of well-constructed stockades and rifle-pits. The batteries were shelled for two hours before they were silenced, while the stockades were swept by Gatlings and Nordenfeldts. The Burmese returned to their positions again and again as soon as the ship that had silenced them had passed on. On the morning of the 24th the British landed and occupied the fortifications, which had been abandoned, but did not venture to attack the army encamped two and a half miles away, commanded by high officers, who could be distinguished by their golden umbrellas. A short distance above Mingyan they found a large number of flat-boats filled with stones, which the Burmese were attempting to sink in the channel. This attempt they abandoned after placing two or three in position, only to see them overturned and swept away by the current.

On the 26th, when the squadron was about 30 miles from Ava, it was met by a royal barge bearing a flag of truce. Two Burmese ministers brought a letter from the King begging for an armistice and offering terms of peace. He said that as he had always protected the interests of the flotilla company, of the teak-trade, and of British subjects in general, he had expected that friendly conditions would prevail. When the English invaded his country he felt obliged to resist in order to maintain the national honor. In his conciliatory reply to the ultimatum he had conceded some of the rights and privileges demanded, but could not decide on the others because

time was not given for deliberation over such important matters. Now, for the sake of peace and the maintenance of friendly intercourse between the two countries, he was willing to grant all the demands contained in the ultimatum. Gen. Prendergast replied, demanding the unconditional surrender of the King, with his capital and flotilla, and the disbandment of his army. The steamer that brought the barge was captured.

No reply having been received, the squadron prepared to attack the Ava forts, and steamed up the river on the 27th. The channel was blocked below the forts by a sunken steamer and a line of boats. These obstacles could be passed, but at Ava the channel was effectually obstructed. They were about to open fire on the lower redoubt when the envoys returned with the King's answer acceding to all demands. The Burmese commander refused to surrender the forts until he received orders from the King by telegraph. The position was very strong. It could not have been taken without heavy losses, and could not have been carried at all by the plan of attack decided upon, through ignorance of the country. When the British landed, the troops, 2,000 in number, were laying down their arms. Many were armed with Martini rifles. The rifles and 28 guns were placed on board the fleet, the forts and batteries dismantled, and 46 guns destroyed. After having found a passage through the obstructions in the river, the flotilla ascended to Mandalay.

Col. Sladen, the civil officer of the expedition, sent a letter to Kinwoon Mengye, calling on the King to come on board the flag-ship, according to the terms of the surrender; but he would not venture to leave the palace, fearing assassination. No answer being received, the troops landed on the 28th and marched in three columns to the city. Col. Sladen entered the palace, and to him the King surrendered, but obtained a promise that he should not be disturbed in his palace that night, and that the women might go in and out. A strong guard of British soldiers was placed around the enclosure; but, as orders had been given that women should pass freely through the Queen's gate, several hundred women from the town entered and carried off a large part of the valuable property. Col. Sladen interfered to save the crown-jewels.

The King was subjected to much indignity in his removal to the steamer, being obliged with his invalid Queen to walk some distance, and then paraded through the town in a cart drawn by oxen. This scene was productive of demoralization and anarchy, and during the following night, no precautions being taken to guard the town, there were serious riots, the sepoys were attacked, many people were killed, and amid the disorder people were robbed, among them the royal princesses, and houses were pillaged. These acts were all attributed to Burmese rioters and dacoits. The next day

five regiments and a battery of artillery were garrisoned in the town.

The King was deserted by his ministers at the approach of the British. They had already made up their minds to a British occupation, and were willing to accept a new King under a British protectorate as a relief from the weakness of Thebaw and the tyranny and extravagance of the Queen. If the high officials had not conspired to frustrate the arrangements for the defense of the river, the British could never have conquered the country without the simultaneous advance of an army by the land route. The ministers now welcomed the invaders and placed their services at their disposal.

The King, with his two queens and the queen-mother, were conveyed on a steamer, guarded by the naval brigade, down to Rangoon, and thence to Calcutta. He was accompanied by 78 officials, among them Kinwoon, the senior minister, whose departure took place without the knowledge of Gen. Prendergast, and was exceedingly inconvenient, as he was the man best qualified to aid the British authorities in establishing order.

The Civil Administration.—The task of reorganizing the machinery of civil government devolved upon the chief political officer, Col. Sladen. Because the military expedition had met with so little opposition from the inhabitants, it was supposed that the country would settle down quietly under British rule, if the officials were retained in office, and carried on their functions the same as before. It was decided to continue the Hlootdaw in power, composed of the same members as before, with the addition of Col. Sladen, who took the presidency. The chief place in the actual administration was given to Tinedah, because he had exercised the same powers under Thebaw, and because he had been the most powerful and inveterate enemy of the British, and therefore the most important man to be propitiated. So long as they expected that the native system of government would be preserved, and that another prince of the Alaungpra dynasty would be set on the throne, they served the English loyally. The merchants of Rangoon and the official class in India raised an interested clamor against a simple protectorate, and objected especially to Tinedah, and induced Mr. Bernard, on his arrival, to remove him, although he effectively held in check the elements of rebellion and disorder. When the officials saw that the national institutions were to be subverted, they secretly encouraged and aided the general revolt. Village feuds have always been common among the Burmese, and unusually so after the demoralization and disorganization of society resulting from the British annexation of Pegu. The prevalence of bribery under the last two kings enabled the leaders of bands of village raiders to purchase immunity. They thus became habituated to lawlessness, and their reprisals degenerated

into brigandage. Gen. Prendergast took his forces, except those that were posted at Mandalay and in the garrisoned stations below, up to Bhamo to overcome any military resistance he might encounter there, and complete the conquest of the country. Scarcely had he left Mandalay, when plundering and incendiaryism became rife in the immediate neighborhood of the capital. The King's soldiers, scattered about the country, most of whom had been allowed to take their arms away with them, had no means of living except by robbery. A decree was issued that no one should be permitted to keep arms, the effect of which order was to deprive the peaceful population of their means of defense against robbers, while the robbers themselves kept out of the way.

Changes in the Administrative Arrangements.—Annexation was not definitely decided upon until Lord Dufferin visited Mandalay, and telegraphed to the home Government on Feb. 18, 1886, recommending that course. He appointed a commission to draw up a code of laws for the new province, embodying such parts of the India acts as were applicable to Burmah. The penal and civil codes went into force there on Feb. 26, 1886, the date of the proclamation of the Queen-Empress, declaring Upper Burmah, with the exception of the Shan states, to be a part of British India. The administration was taken out of the hands of the Hlootdaw and intrusted to British officers in the middle of February. Col. Sladen, who was identified with the transitional policy of retaining the Burmese officials, was discharged from his post when the complete incorporation of Burmah in the British Empire was decided upon. He left on the 1st of April, and Sir Charles Bernard assumed the direction of the administration. A force of 4,000 Sikhs and Goorkhas was brought from India to act as a military police. Sir Charles Bernard attempted to administer the country with European officials, but the civil administration was a failure, because, having undertaken to defray the expenses out of the revenue of the country, he employed inexperienced persons, whose only recommendation was that they could speak Burmese. In July four commissioners, who were civil officers of large experience, with a considerable number of subordinate officials, were brought from India, enough to constitute a full civil staff. The country was divided into fourteen districts.

The Subjugation of Burmah.—In the early part of January there were about 10,000 insurgents in the vicinity of Mandalay. Flying columns that were sent out from Thayetmyo and from the occupied posts along the river were fired upon from ambuscades in the jungle, and encountered bands of 1,000 or more in stockaded villages, which were usually carried with heavy losses among the defenders and but slight losses on the British side, because the European ammunition of the Burmese was soon expended, and they were reduced to

scanty supplies of the coarse gunpowder of the country and slugs made from chopped-up telegraph wire and similar material. The Shans on the Siamese frontier raided the south-eastern part of British Burmah under the lead of a Buddhist priest. The British early adopted rigorous measures against guerrillas, shooting all who were taken prisoners. A colonel made a practice of photographing the death-agony in the faces of insurgents who fell into his hands, but was afterward tried and condemned to military punishment for his inhumanity. The military authorities made arrangements, after the conclusion of the expedition, to send a large part of the forces back to India; but, instead of reducing the army of occupation, they soon sent for cavalry reinforcements. The rebels were so determined in the national cause that, even when without ammunition, they still attacked British posts within a few miles of Mandalay with only their dahs, or short swords. By July there were 30,000 troops and military police in Upper Burmah, yet in most districts British authority did not extend beyond rifle-shot from their fortified posts. In the occupied cities anarchy and confusion prevailed, and secret hostility to the conquerors made itself felt in many ways. The forces in British Burmah were likewise re-enforced; but that country was also a prey to anarchy and rebellion. The lower province, which had been under British administration for forty and some parts of it for sixty years, was ravaged by bands of guerrillas, who burned villages, murdered Europeans, and attacked the forces that were sent against them. A rebellion in the province of Tenasserim was suppressed by the aid of American missionaries who led the Christian Karens to battle against the insurgents. The indiscriminate executions that the British resorted to for the purpose of intimidation only rendered the resistance of the people more general and more determined. The summary trials before officers who were not legally qualified to act as judges, the denial of the right of appeal in criminal cases, and other arbitrary treatment to which all classes were subjected, in Mandalay as well as in more disordered places, engendered a universal feeling of discontent.

Lord Dufferin issued a proclamation of amnesty. Many of the insurgents availed themselves of its terms. Among these was the brother of Boshway, yet after his surrender he was tried and condemned to penal servitude for life. Boshway himself offered to give himself up if his life were spared, but his offer was refused. He then gathered a much larger force and for months a whole brigade was engaged in keeping him in check. Lord Dufferin was strongly opposed to the slaughter of the inhabitants by scouting parties and the incessant executions ordered by the civil magistrates. But his orders on the subject were disregarded by the inexperienced officers and youthful magistrates, who, without legal expe-

rience, had the power of life and death placed in their hands. The scandals in the administration of justice partly ceased after complaints had been raised in the British Parliament. From the 1st of September trials resulting in sentences of death or transportation could be reviewed by the newly appointed commissioners and sub-commissioners.

With the re-enforcements that came before the rains flooded the country, and with the native police drawn from the Christian Karsens, employés of the Bombay company, and such peasants as would take English pay, the British established many posts away from the river, instead of merely scouring the country with flying columns, shooting at long range every native carrying a dah or a stick. The levies that were brought from the Punjab to aid in the work of pacification mutinied when their officers tried to restrain their cruel and predatory instincts, and killed, pillaged, and destroyed more ruthlessly than the worst of the dakoits. In the height of the rainy season sickness so prevailed among the troops that some of the posts previously occupied were abandoned. On August 16, through the neglect of the civil authorities to keep the embankment in order, the water broke through at Mandalay, inundating an area five miles long and two wide, embracing the chief commercial district of the town, and causing a great loss of life and property, and subsequent sickness and distress. The Burmese officials and the traders had warned the chief commissioner of the dangerous condition of the embankment, but no attention was given to their admonitions.

The Rebel Leaders.—The first of the princes of the dynasty who was able to collect a rebel army was the Myentzein prince, son of the War Prince, who conducted his operations from the Shan hills, that reach within seven miles of Mandalay, and received aid and protection, when hard pressed, from the Shan prince of Thebaw. The prince himself was a minor, but two of his uncles commanded his forces and conducted his affairs. He was for a long time the most important adversary of the British. All the principal insurgent leaders embraced his cause. From the time that he took the field until the summer rains rendered operations against him impossible, he occupied the country between Toungoo and Mandalay, and was allowed to fly the peacock-flag almost within sight of the capital. His sway extended over the Kyonsei district, reaching from Mandalay to the Sittang river, and down the Sittang valley. The death of the Myentzein prince, which occurred from fever in August, deprived the forces that had raised his banner of their coherence. But a partisan leader had appeared who proved a more formidable enemy to the invaders. This was a peasant named Boshway, who held the entire country from Irrawaddy westward to the boundary of Aracan. Burmese Woons led the insurgents in the

Chindwin district. Hla-Oo and Min-Oo, two bandit chieftains who combined patriotism with robbery, ravaged the Sagaing district, farther north. The Moatsobo district, north of Sagaing, was disturbed by irregular bands, re-enforced by Kachyens from the north. The Kachyen country was left alone by the British after the mountaineers had routed a strong column that was sent to punish one of their chiefs about the 1st of June. No attempt was made to conquer the Shan tribes, whose country extends along the eastern bank of the Irrawaddy, from Bhamo to below Mandalay, until after the rainy season. The Shans showed no disposition to accept the favorable offers made to them, but evinced great repugnance to the strangers, and were the most troublesome enemies the British had to deal with. They raided the Mandalay plain, carried off officials, and burned villages. To stop these forays the authorities forbade the export of salt and provisions to the Shan states, but they retaliated by destroying a considerable town. The Myentzein prince would not have been able to maintain himself so long without the assistance of the Shans. They gave succor and shelter also to a later Alaungpra pretender, the Limbin prince. The country south of Mandalay as far as Myingzan was brought under British rule so thoroughly that by September the telegraph was again working and the armed police were able to maintain order. The Pagan district, which in the earlier period of the occupation was exceedingly disordered, was gradually cleared of all considerable bodies of insurgents. Between it and the old British frontier dacoit bands still made trouble. To the southeast of Mandalay the country that had owned the rule of the Myentzein prince was still held by his now disorganized forces. Farther south, the Yemethen district was occupied by the Kyumendine prince, the most considerable of the Alaungpra pretenders after the death of the Myentzein prince. The country surrounding Ningyan, farther south still, was occupied by a youthful chieftain named Buddha Yaza.

Convention with China.—Before the expedition for the deposition of Thebaw and the conquest of Upper Burmah was undertaken, the British Government had consulted the Government at Pekin, and had given assurances that there was no intention or desire to impair Chinese rights or interests. After the annexation of the kingdom of Ava to the British Empire was proclaimed the Marquis Tseng presented the claims of China. First, he insisted on the recognition of Chinese suzerainty over Burmah. In the last century a war between China and Burmah terminated in the occupation of Burmah by a Chinese force, but only after the first army that was sent, which numbered 50,000 men, had been totally destroyed by the Burmese. The recognition of the supremacy of China by the payment of tribute was the basis of the peace then concluded. Accordingly, the Bur-

mese have since then sent an embassy to Pekin every ten years with tribute to the Emperor. Because the ambassadors usually returned with more valuable presents than they took to Pekin, some were inclined to deny that there was an acknowledgment of suzerainty implied in the decennial mission. The English Government, however, could not dispute the historical fact, and, according to its promise, agreed to recognize the nominal suzerainty of China over Burmah by continuing the periodical presents. The Chinese expected, besides, to be compensated for quietly allowing Great Britain to extend her dominions in the Indo-Chinese Peninsula up to the confines of China. The task of keeping in order the wild tribes on the northern border of Burmah, who have alternately acknowledged the sovereignty of the King of Ava and the Emperor of China by the payment of a nominal tribute, the Government of India was entirely willing to transfer to the Chinese authorities. But the Chinese did not regard the abandonment of the sovereignty over this district as a concession, but considered that the assumption of the duty of keeping the trade route gave them additional claims for compensation. They accordingly asked for the cession of the port of Bhamo, which is half peopled by Chinese, with its district, including the territory extending from Bhamo fifty miles down the Irrawaddy to the river Shwely, which would give them a natural and strategic frontier. The negotiations were prolonged till the 24th of June, when a convention was signed at London.

The British Annexation.—The British soon found that, although the conquest of Burmah and the overthrow of the Government had been accomplished by a military promenade, in which only seven of the rank and file of the invading army had fallen, the annexation would probably be the work of years, and would require the sacrifice of thousands of Indian soldiers, and swallow millions of treasure, instead of the £380,000 estimated as the cost of the expedition. In the interval between the capture of Mandalay and the proclamation of annexation a rebellion of formidable dimensions was begun. The ministers of the Hlootdaw, on whom the British relied to govern the country, secretly aided and encouraged the movement. The district officials left their posts and took part in the rebellion, which became general as soon as the Burmese awoke to the fact that their system of monarchy was doomed to extinction. Some of the more energetic of the seventy Alaungpra princes still living organized small armies. The British were shut up in the fortified posts along the river, but were not even able to keep the telegraph line open between the river towns. The revolt spread into British Burmah, and English

officials were killed and the Government resisted. The Shans, who were supposed to have no sympathy with the Burmese idea of monarchy, joined the rebel princes, and gave them refuge when pursued by the British flying columns. In order not to belie the representations made in England that the people of Upper Burmah were desirous of being taken under British rule, the operations undertaken to hold in check the rebel chieftains were described in the reports as being conducted against dacoits for the protection of peaceable villagers, although dacoity, or gang-robbery, such as once existed in Bengal, and is still practiced in Central India, is not known in Burmah.

When Sir Charles Bernard, the Chief Commissioner of British Burmah, arrived at Mandalay, in the latter part of December, he had Tinedah Mingye arrested and sent to Rangoon. This act confirmed the Burmese in the belief that the conquerors intended to subjugate them and overturn all their institutions, and consequently it increased among them the spirit of resistance.

When, after nine months of occupation, the English found themselves in possession of but a small portion of the country, and were only able to hold their ground with a large army, in which cholera and fever caused heavy losses, they determined to put forth strength enough to thoroughly reduce the country to their rule during the coming healthy season. Sir Herbert MacPherson, the commander of the military forces of the Madras Presidency, was placed in command of the army of occupation. As soon as the plains became dry enough for military operations, he took the field with the finest regiments of his army, but died soon after his arrival. As no other general of first-rate ability was available, Sir Frederick Roberts, the commander-in-chief of the Indian army, assumed the immediate command of the army in the field, and proceeded to Burmah in the beginning of November. He had at his disposal a force of over 40,000 fighting men, comprising ten battalions of European infantry, four regiments of native cavalry, a body of more than 800 mounted infantry, and nine batteries of artillery, including mountain and elephant guns. The native troops included Sikhs, Goorkhas, and Punjabee and Beloochee troops, and were composed of the best fighting material in the Indian army. Under the general-in-chief were three major-generals and six brigadier-generals. There were enough transport mules brought from India, and ponies and elephants obtained from the country, to enable the troops to keep the field for long periods. The river communications were kept open by a flotilla, consisting of three armed steamers, three armed tenders, launches with machine-guns, and a number of light-draught steamboats.

C

CABLE-RAILWAYS. As understood at present, a cable-railway is a line of steel rails along which carriages are drawn by a cable made of the best crucible steel wire. Twenty years ago, the only roads operated by cable-traction were comparatively rude affairs, for the most part provided with chains or hempen ropes. These tramways originated in England early last century, and were used mainly for haulage of coal. The first English patent, covering an improvement in the system, was issued to William Chapman in 1808. The patent distinctly foreshadows the present system. An endless rope, passes around a friction-drum revolving on a vertical axis at one end of the line, and at the other end is a grooved wheel around which runs the lower bight of the endless rope. This wheel is mounted upon a carriage which runs on an incline, and is sufficiently weighted to keep the cable taut. The burden-cars are attached to the main part of the rope between the vertical axis and the tension-carriage. (See Fig. 1.)

In 1812, E. K. Chapman proposed to stretch a chain along over the tramway, and provide each car with a friction-wheel turned by a crank. The chain was to be wound around the wheel, and when the crank was turned of course the car would move. Then came direct traction, by what was known as the tail-rope system, by which the cars were attached to a moving rope or chain which was wound around a drum at the top of an incline. The cars were drawn up loaded and descended empty, either

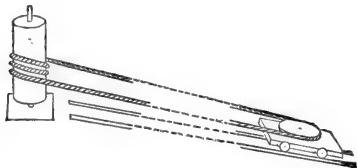

FIG. 1.—CHAPMAN'S PATENT, 1808.

by force of gravity alone, or aided by a "tail-rope," which was attached to the main rope, and was only strong enough to overcome the inertia of the descending train and cable. In 1834 William Jaines proposed to employ hollow rails as receptacles for a moving chain, and to attach carriages thereto. In 1846, E. W. Brandling devised a rudimentary grip, by which two boards were closed upon a moving rope, and the carriage was hauled along. These three inventions were of English origin. In 1858, E. S. Gardner, an American, proposed to inclose the moving rope in a tunnel provided with fixed sheaves, and a slot along its length. (See Fig. 2.) The problem of attaching the cars to the rope is dismissed in his claim as immaterial, any mode of connection being

permissible. This appears to be the germ of the present system of street-railways, which bids fair to supersede the horse-cars, introduced about 1850, in the United States, and soon transplanted to Europe, where they are now extensively used. Other patents contemplated the use of cables elevated on posts, and still others the use of locomotives in subterranean tunnels, connected with cars running on

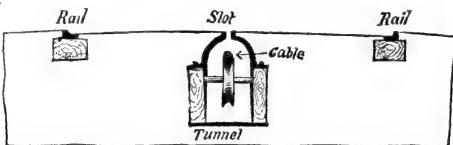

FIG. 2.—GARDNER'S PATENT, 1858.

the surface. Such were some of the earlier devices. To enumerate them all would involve a list of about 250 patents issued in the United States alone, and many in foreign countries.

It was not until 1870 that the first patent for a grip-pulley was issued to Andrew S. Hallidie, of San Francisco. Subsequently he took out many patents on the equipment of cable-roads, and in 1872 he succeeded in securing enough co-operation to justify the construction of a line on Clay Street, in San Francisco, Cal. The problem was to provide a means of transit to and from the high hills that rise a short distance from the water-side, and afford the best building-sites in the city. The difficulties encountered in operating horse-car lines on these hills suggested the need of some improved method, and in June, 1873, the construction of the Clay Street cable-road was begun. The terms of the franchise required that cars should be run on Aug. 1, and at 4 A. M. on the morning of that day the engine was started, and the wire rope, 7,000 feet long, ran smoothly over its sheaves and through the long tunnel. A dummy-car, provided with the inventor's grip, had been hauled to the top of the incline, and Mr. Hallidie himself was obliged to take charge of it—the courage of the man detailed for the duty failing at the last moment. Eight volunteers accompanied him, and the round trip was successfully accomplished, the car stopping at crossings, dropping the cable and picking it up again, and, in short, doing all that was expected of it. In the afternoon of the same day a public trial was attempted, with a passenger-car attached to the dummy. A very large, good-natured, and somewhat uncontrollable crowd assembled, and, after the down-trip had been safely made, the car was stormed in spite of the police, and about sixty persons insisted on a free ride up the hill at their own risk. This crowded the car far beyond its capacity, and subjected the cable and machinery to a

strain far greater than the engineers had anticipated for the trial-trip. With one trifling check, however, the perilous ascent was accomplished, the crowd racing alongside the car and fighting recklessly for places to hold on by. A month later the cars began to run regularly, and, save for the changes and alterations inseparable from new inventions, the road has been successfully operated ever since. A three years' trial so thoroughly demonstrated the usefulness of the system that other roads were built in San Francisco—some of them distinct infringements upon Mr. Hallidie's patents, and so adjudged by the courts—and at present there are more than fifty miles of street-railway in that city alone constructed practically on the same plan. Although designed at first only to overcome excessive gradients, it was found in practice that the system was more economical than horse-traction, even on level ground, and it is now extensively adopted in New York, Chicago, Philadelphia, and other large cities of the United States, and even in New Zealand. That it will speedily be introduced in all civilized lands can hardly be doubted.

The most approved construction of a cable-road for street-service calls firstly for a tunnel under the railway, in which an endless wire rope may run, resting upon a succession of fixed wheels or sheaves. The difficulties in the proper construction of such a tunnel are many, and it has only been by successive improvements that approximate perfection has been reached. The necessity of having an open, longitudinal slot in the top of the tunnel weakens the structure where it should be strongest, and renders it impossible to employ the ordinary cross-ties used in railway construction. The absence of these ties favors the tendency of the rails to spread apart, and the tendency of the grip-slot to close, and this is largely increased by the ceaseless jarring of the ordinary business traffic of the street. It was found impracticable to make any system of half-ties sufficiently rigid. Accordingly, the latest tunnels are so constructed that, if the whole street outside of the rails were washed away, the road-bed would remain intact, resting upon independent piers of masonry. To effect this, V-shaped yokes or ribs of iron are bent or cast in the required shape. The rails are bolted to the tops of the arms of the yoke, and the whole structure stiffened with cross-braces, resting upon solid piers, with foundations as deep as the nature of the soil requires. Within the arms of the yoke is the hollow iron tube, or tunnel, with its longitudinal slot, through which connection is made between car and cable. (See Fig. 3.) When all the parts are in place a mold is made, inclosing the whole framework, and the open spaces (excepting, of course, the tunnel) are filled with hydraulic cement. It will be noted that the carrying-sheave is not centered under the slot, as in Fig. 1. This is done to avoid the drip of water and dirt from the opening, which might injure the cables.

The existing system is made possible by the improved method of manufacturing wire rope, which is now made of crucible steel wire, capable of bearing a tensile strain of 120 tons to a square inch of sectional area. The lightness, strength, and comparative cheapness of

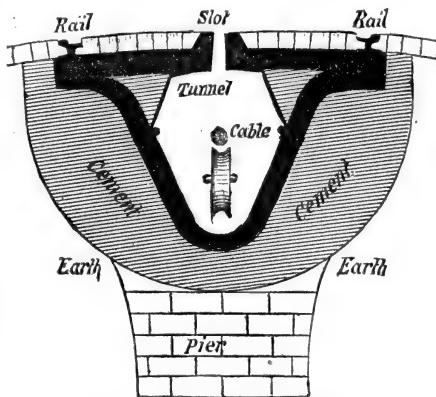

FIG. 3.—RECENT CONSTRUCTION.

the cable is an important element in the first cost. The maximum all-round length of an endless cable varies with the local conditions. The main line on Market Street, San Francisco, is 24,125 feet long, and works satisfactorily, but the line is straight and the grades moderate. The Clay Street line, in the same city, runs up and down grades varying from 1 in 28 to 1 in 6 $\frac{1}{2}$, reaching a height of 307 feet at a distance of 2,800 feet from the starting-point. The total length of the cable is about 7,000 feet. Provided the line is perfectly straight, and moderately level, it is evident that the cable will be held in place by its own weight, and will run upon the grooved carrying-sheaves; around a large wheel of at least 100 times its own diameter, at the end of the line, and back to the starting-point, without anything to hold it in position so long as it is kept taut. If it is to draw a heavy load, it must also be prevented from slipping. The device for keeping the rope taut is identical in principle with that of Chapman's patent (Fig. 1). Slipping is prevented either by taking several turns around a drum, or a half-turn around a grooved wheel, provided with automatic clasping-jaws, or as shown in Fig. 4, which is one of the most approved modern methods: A is the incoming and B the outgoing cable, C and C' are the friction-pulleys, D is the tension-pulley, and E the weight that pulls it away from C and C', and keeps the cable taut. The incoming cable just clears the top of C', passes three fourths round C', three fourths round C, below C', and thence round D, where it becomes the outgoing cable. The arrows show the direction of movement. The tension-pulley D is mounted on a carriage, not shown in the diagram, and the weight E is

made sufficiently heavy to take up the slack of the cable and render the friction around the pulleys C and C' ample for the required traction.

The foregoing contemplates the simplest possible conditions, namely, a straight, level course, with the driving machinery in direct continuation of the line of rails. In practice, these conditions are always complicated. The engine-house must usually be at one side of the track, so that the cables must be delivered and received at right angles with the service-line. This is easily

three feet apart. In this case the grip is not released, but a nice adjustment is required, so that the grip-bar shall fairly clear the sheaves and yet not receive too much lateral strain from the tension of the cable. This adjustment is effected by an iron guard, just above and a little in advance of the sheaves. Against this guard an attachment of the grip-bar bears while the car is rounding the curve.

In some situations the tunnel is unnecessary—such, for instance, is the bridge between New York and Brooklyn, where the track is given exclusively to car-traffic. In such case, while the same general rules govern the construction, the cable and carrying-sheaves are easily accessible for inspection and repair, while frequent traps or man-holes are required in a tunnel line. On the other hand, the cable,

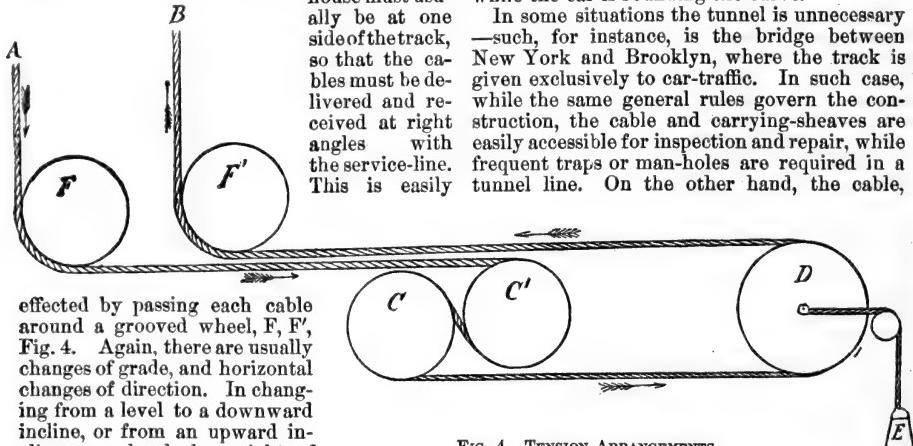

FIG. 4.—TENSION ARRANGEMENTS.

effected by passing each cable around a grooved wheel, F, F', Fig. 4. Again, there are usually changes of grade, and horizontal changes of direction. In changing from a level to a downward incline, or from an upward incline to a level, the weight of the cable will keep it in place; but the change from a level to an upward incline tends to lift the cable from its carrying-sheaves. At such angles depression-sheaves are placed at the top of the tunnel. They are exactly like the carrying-sheaves, and are hung so that the grip will pass below them by about as much as it passes above the carrying-sheaves. The same rule applies in a change of grade from a downward incline to a level. When the grip has hold of the cable, the latter is lifted clear of the carrying-sheaves at that point, but must, either by gravity or some mechanical device, return to them as soon as the grip passes.

In changing direction horizontally, two different methods may be followed. (See Fig. 5.) The heavy black line represents the cable, and the broken lines the rails. At the left the direction is changed by passing the cable around

a sheave turning on a vertical axis, and with its periphery touching the two lines of direction. In such a case as this the cable is released, while the car goes around the curve by its own momentum, aided, if possible, by gravity. At the right of Fig. 5 the cable bears sidewise against a series of sheaves, set about

being exposed to the weather, becomes wet, and often more or less coated with ice for its entire length.

The life of a cable appears to depend mainly upon the grip, and much ingenuity has been expended upon devices that can be trusted to bear any probable strain and yet will not wear out the cable. A grip that clasps the cable like a vise is the simplest and most trustworthy, but it is very destructive to the cable, because, while it is tightening, the friction must of necessity be great. On a railway in Hoboken, N. J., a cable was recently worn out in less than three months by a grip of this kind, while that on the Brooklyn Bridge lasted for three years, and even then did not show much external wear. Its inside strands, however, had been crushed by pressure and incessant use, for this cable runs day and night without stopping, and during the busy hours draws heavy trains at intervals of one minute and a half; 26,000,000 passengers were transported by this cable during the year. This difference in wear of cable is due to the use of a grip devised by W. H. Paine, C. E., which starts the car with

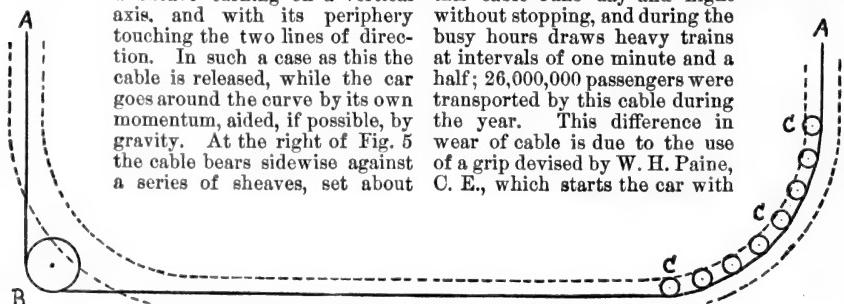

FIG. 5.—HORIZONTAL CHANGES OF DIRECTION.

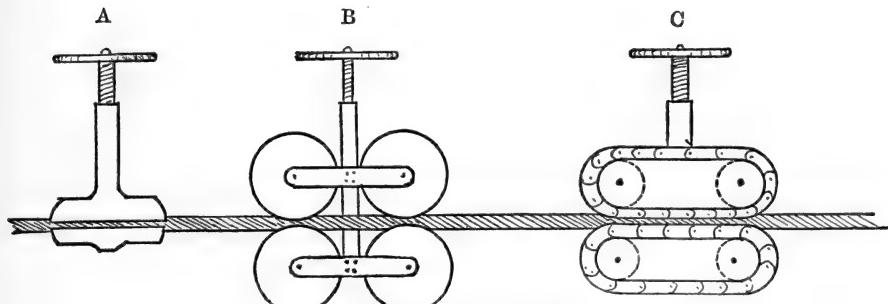

FIG. 6.—DEVICES FOR CABLE-GRIPS.

little friction, and does not grip the cable fixedly until full headway is attained. In Fig. 6 three different grips are indicated, A showing the solid, vise-like grip, B the four clutch-pulleys, as in the Paine method, and C Taylor's endless-chain grip. Details of the tightening arrangements are omitted in the drawings for the sake of clearness, but it may be said that the screw and the toggle or knee-joint are important factors. In the Paine method, attachments are made so that when full headway has been attained, a solid grip seizes the cable and receives the permanent strain. This acts automatically, so that when the car-brake is applied the solid grip is released, and the cable passes between the clutch-pulleys as fast or as slowly as may be desired. In the Taylor grip (C) closely fitting endless chains run in grooves around the vise-like jaws, and stop only when the pressure is made so great that cable, chain, and jaws become relatively fixed. The connection between the grip and the car is usually by means of a shank or shanks thin enough to pass freely through the tunnel-slot, and broad enough to bear all probable strains of traction.

Careful estimates have been made of the comparative running expenses of horse-railways and cable-railways, which, while they vary somewhat, are invariably in favor of the latter. The footings of two elaborate tables, giving the annual running expenses, are as follows: A horse-railway, 3 miles, double track, speed $4\frac{1}{2}$ miles per hour, 32 cars, $2\frac{1}{2}$ minutes apart = \$138,880. A cable-railway, same length, speed 6 miles per hour, 24 cars, and 24 dummies, $2\frac{1}{2}$ minutes apart = \$88,246.71. Difference in favor of cable-road, \$50,633.29. The carrying capacity of cars and dummies on the cable road can be increased indefinitely, with comparatively slight increase in the running expenses.

CALIFORNIA. State Government.—The following were the State officers during the year: Governor, George Stoneman, Democrat; Lieutenant-Governor, John Daggett; Secretary of State, T. L. Thompson; Treasurer, D. J. O'ullivan; Comptroller, John P. Dunn; Superintendent of Public Instruction, W. T. Weleker;

Attorney-General, E. C. Marshall; Surveyor-General, H. I. Willey; Railroad Commissioners, G. J. Carpenter, W. P. Humphreys, and W. W. Foote. Supreme Court: Chief-Judge, R. E. Morrison; Associate Justices, W. H. Myrick, E. W. McKinstry, E. M. Ross, J. D. Thornton, J. R. Sharpstein, and S. B. McKee.

Financial.—The report of the State Treasurer for 1885 and 1886 shows the sums paid by the counties to be as follows: 1885, \$3,708,715.48; 1886, \$4,695,651.36.

In 1885 the school fund received \$1,694,863.20; in 1886, \$1,743,731.34. General fund: 1885, \$1,619,741.40; 1886, \$2,545,054.84.

In February, 1886, the State Superintendent apportioned school moneys to the various counties to the amount of \$1,513,086.85 on the basis of 250,097 children.

State University.—In 1885 there were in the colleges at Berkeley 241 students; in affiliated colleges, 280; total, 521.

The Academic Senate, comprising the professors, instructors, lecturers, and assistants of all departments, numbered eighty-nine members. Of this number thirty-two were at Berkeley. The university had real property, funds, and endowments, to the aggregate value of over \$3,000,000, including a State endowment fund of \$811,500; United States endowment, \$492,000; D. O. Mills's endowment, \$75,000; Brayton fund, \$90,155; Reese Library fund, \$50,000; university site and building, \$1,000,000; Lick fund and observatory, \$700,000; Toland property, \$15,000; Hastings endowment, \$100,000.

Irrigation.—Perhaps the most important topic before the people of the State, and the one that has excited the most interest, is irrigation. A convention for considering the subject was held at Riverside in May, 1884, and another at Fresno in December of the same year. On the 26th of April of this year the Supreme Court, in deciding the case of *Lux vs. Haggin*, held by a majority of one that the common law prevails in California respecting riparian rights, the riparian owners along the streams of the State being entitled to the exclusive use of the flowing water. This decision practically renders worthless the land remote from streams in arid

districts, and destroys the value of many miles of irrigating ditches. A State Irrigation Convention convened in San Francisco on the 20th of May and adjourned on the 21st. The results of its deliberations are embodied in the following demands:

Resolved, That it is the sense and determination of this convention:

I. That the cubic foot per second be adopted as the unit of measurement throughout the State.

II. A declaration by the Legislature that all the unnavigable waters of the State, in natural streams and lakes, not rising or wholly included in lands under private ownership, belong to the people thereof, and are subject to appropriation by the people for irrigation, mining, manufacturing, and other useful purposes, and that the customary law of appropriation of water for these purposes as it has grown up in this State should receive the formal sanction of that body as follows:

1. That there is no individual or corporate ownership of water except that which rises upon land under such individual or corporate ownership; this ownership continuing so long only as it remains upon the premises, or so long after it leaves them as they may control it in pipes, ditches, or any other means of conveyance, and apply it to useful, beneficial, and necessary purposes.

2. That the appropriation of water from any public source does not imply individual or corporate ownership, but that it is taken for the time and to the extent only that it is applied to a useful and necessary purpose, after which it is free to other or subsequent appropriators under the same conditions.

3. That the appropriation of water and its conveyance through canals and ditches for sale, rental, or distribution, is a useful, necessary, and beneficial purpose, sale or rental not implying ownership of the element, but just remuneration for the use of the franchise and the plant employed in its conveyance.

III. A system of law providing for the control, management, and just distribution of the waters of the State in accordance with the foregoing principles.

IV. To so extend the law of eminent domain as to allow an irrigation district when formed, corporation or individual, to condemn and pay for rights of way, lands, canals, ditches, and water-claims, and rights of whatever nature, held by any person or corporation, or any other private rights of property, however existing or acquired, or by whatever name designated, which may be necessary for the appropriation or use of water: *Provided*, That in condemning water used at the time of the commencement of an action for the same, a manifestly greater public advantage and use can be shown.

We respectfully submit the accompanying measures, which are proposed for adoption by the Legislature and as a pledge to be required of candidates as hereinafter set forth.

These measures consist: 1. In a proposed constitutional amendment to fix and determine the nature of water-rights; 2. A proposed constitutional amendment to regulate the use of water appropriated for irrigation; 3. A proposed act of the Legislature concerning the right to acquire the use of water by appropriation; 4. The repeal of section 1422 of the Civil Code.

An Executive Committee was appointed to carry out the objects of the convention.

Chinese.—Two Anti-Chinese Conventions met in Sacramento on March 10, and, after fusing, remained in session until the 12th. The following resolutions embody the results of the session:

That we demand that the Government of the United States take immediate steps to prohibit, absolutely, this Chinese invasion.

That to encourage the early removal of the Chinese we accept the suggestion of the Constitution of California, which says that no Chinese shall ever be employed upon any public work of the State, except in punishment for crime.

That the interests of the people of the State of California demand, in harmony with the organic law of the State, that the presence of Chinese should be discouraged in every particular, and that in every instance preference should be given to white labor; and we earnestly appeal to the people to do their utmost to supplant the Chinese with such labor. We are not in favor of any unlawful methods, but, so firmly are we impressed with the great importance of discouraging the employment of the Chinese, that we recommend that they be not patronized in any way, and we are in favor at the earliest moment of boycotting any person who employs Chinamen, directly or indirectly, or who purchases the products of Chinese labor. The date at which the boycott commences in different localities shall in all cases be left to the local leagues.

That a permanent State organization be perfected by this State Convention, to be known as the California Anti-Chinese, Non-Partisan Association.

That an Executive Committee be selected by the chairman of the convention, consisting of three from San Francisco, and one from each other county in the State, who shall be fully empowered to have control of the State work, call State Conventions at such times and places as they may deem proper, and devise ways and means for advancing the cause.

That we recommend that a State organizer be selected by the convention, whose compensation shall be fixed by the Executive Committee.

This convention had been preceded by active measures for driving out the Chinese in many localities.

Political.—The Prohibition State Convention met in Sacramento, on the 18th of May, and nominated the following candidates: For Governor, Col. Joel Russell; Lieutenant-Governor, Judge A. D. Boren; Supreme Judges, Judge William G. Murphy and Judge Robert Thompson; Secretary of State, Frank E. Kellogg; Comptroller, J. A. Fairbanks; State Treasurer, H. S. Graves; Attorney-General, George Babcock; Surveyor-General, George B. Tallman; Superintendent of Public Instruction, Rev. D. A. Mobley; Clerk of the Supreme Court, Julius Lyons. In addition to the prohibition of the manufacture, sale, and importation of all alcoholic beverages, they declared in favor of a Sunday law, and adopted the following:

We are in favor of the largest personal liberty consistent with orderly civil government, and would gladly welcome to our free country all those who come with the intention of enjoying our institutions as they find them; but we demand the exclusion of those whose purpose in coming here is to overthrow our government and destroy our liberties. We demand, further, that the right of franchise be withheld from all foreigners till they shall have lived in this country for a period sufficiently long to enable them to become familiar with our institutions and politics, and to demonstrate their disposition to live in conformity therewith.

The Republican State Convention met in Los Angeles on the 25th of August, and adjourned on the 27th. The following nominations were made: For Governor, John F. Swift, of San Francisco; Lieutenant-Governor, W. R. Waterman, of San Bernardino; Secretary of State, Walter S. Moore, of Los Angeles;

Comptroller, J. E. Denny, of Visalia; Treasurer, Jacob H. Neff, of Placer; Attorney-General, W. H. H. Hart; Surveyor-General, Theodore Reichert, of San Francisco; Superintendent of Public Instruction, Ira G. Hoitt, of San Francisco; Clerk of the Supreme Court, J. A. Orr, of Plumas. Supreme Judges: A. V. R. Patterson, of San Joaquin; T. B. McFarland, of Sacramento; and Judge Hamilton, of Alameda.

The Democratic State Convention met in San Francisco on the 31st of August, and adjourned on the 4th of September. The following were the nominees: For Governor, Washington Bartlett, of San Francisco; Lieutenant-Governor, Michael F. Tarpey, of Alameda; Secretary of State, William C. Hendricks, of Butte; Comptroller, John P. Dunn, of Sacramento; Treasurer, Adam Herold, of Santa Clara; Attorney-General, George A. Johnson, of Santa Rosa; Clerk of the Supreme Court, J. D. Spencer, of Stanislaus; Superintendent of Public Instruction, A. J. Moulder, of San Francisco; Surveyor-General, E. O. Miller, of Tulare; Supreme Judges, Jackson Temple, Jeremiah F. Sullivan, and Byron Waters. The platform endorses the national Administration, opposes contract convict labor, and Chinese immigration; denounces the great railroad corporations of the State for non-compliance with the tax laws, and opposes the amendment to the State Constitution known as the "Heath Amendment," as its adoption would accord with the wishes of the non-taxpaying monopolists of the State. The following are the other important planks:

Resolved, That this convention recommend the passage of an act of Congress, providing for the free coinage of both gold and silver, by the terms of which all gold and silver bullion offered at the several mints of the United States shall be received in exchange for money or gold or silver certificates at the rate now fixed by law for standard dollars of gold, and silver certificates shall be receivable for all public purposes and interchangeable for gold or silver, as the case may be.

Resolved, That the present tariff on wool, prepared by a Republican commission appointed by a Republican President, is an unjust discrimination against a great industry, and we denounce the same, and demand the restoration of the tariff of 1867. That in view of the brilliant future that awaits California in the development of its wine interests, we most heartily favor the bills now pending in Congress for the release from taxation of spirits used in the fortification of sweet wines, and the protection of our wine industries from the injurious effects of fraud and the unrestricted sale of spurious wines.

And we also favor legislation protecting the raisin industry.

We are in favor of liberal wages and free labor.

All associations formed for the purpose of developing the intelligence, promoting the welfare and protecting the interests of the laborer and mechanic, and to enable them successfully to contend for and maintain their rights by peaceful and efficient means against powerful and oppressive combinations, should be encouraged and expressly sanctioned by law.

Resolved, That mining is one of the great and beneficial industries of this State; therefore, it is the duty of the Government to devise some plan to protect that interest and for mining to be continued without injury to any other industry.

Resolved, That the Democratic party recognizes the importance of the water question, and the absolute necessity for its speedy settlement, and the party can and will settle it on a basis of equal and exact justice to all interests involved.

Navigation shall not be impaired under any pretext.

No class of individuals shall take, injure, or destroy the property or rights of any other class, except under the operation of the law of eminent domain. These rights being guarded and protected, the waters of the State are the property of the people of the State, to be used for irrigation, mining, manufacturing, and other useful purposes. Appropriation of water, whether heretofore or hereafter made, should give no right to more water than is absolutely used in an economical manner for a beneficial purpose.

To guard against a monopoly of water for irrigation, irrigation districts should have the right to acquire by purchase or condemnation the means necessary in conducting the water to the lands comprising such irrigation districts. The English law of riparian rights is inapplicable to the circumstances and condition of California.

The State may, at any time, assume control of the diversion, use, and distribution of water under general laws enacted for that purpose, provided the State shall in no event be called upon, by taxation or otherwise, to construct irrigation-works.

C. C. O'Donnell was the anti-Chinese candidate for Governor, and there was also an "American" candidate.

The election on the 2d of November produced a mixed result. According to the latest returns, the Democratic candidate for Governor has a plurality of about 600 over the Republican. The Republicans elected the Lieutenant-Governor, the Attorney-General, the Superintendent of Public Instruction, the Surveyor-General, and two Justices of the Supreme Court. The Democrats elected the Secretary of State, the Comptroller, the Treasurer, the Clerk of the Supreme Court, and one Justice of the Supreme Court. The Republicans elected four Congressmen and the Democrats two. In the State Senate the Democrats have a majority of 12; in the Assembly the Republicans have a majority of 2, leaving the Democrats with a majority of 10 on joint ballot.

Legislative Session.—The Legislature met in extra session, at the call of the Governor, on July 20, and remained in session until Sept. 11. The Governor, in his proclamation, gives the reasons and objects of the call as follow:

The Supreme Court of the State in a recent decision announced that the riparian owners along the unnaviagable streams in California owned the flowing waters in such streams, and are entitled to the exclusive right to use the same. The wide-spread disaster which this decision threatens to the agricultural interests and the consequent general excitement and apprehension make it proper that the legislative and executive branches of the government should take prompt and efficient action to prevent the injurious consequences which will otherwise inevitably flow from the establishment of such a rule of law by the highest court in the Commonwealth.

Another matter of great public concern is the reorganization of the Supreme Court. The existing system has not given satisfaction, and the evils are growing worse. It is cumbersome to a degree. I do hereby beseech the following subjects upon which it is assembled to legislate:

1. To propose and submit to the people of the State

an amendment or amendments to Article XIV of the Constitution of the State relative to water and water-rights.

2. To propose and submit to the people of the State such amendment or amendments to the Constitution of the State as may be necessary or proper to secure to the people the right of appropriation, diversion, and use of flowing water for irrigation or other beneficial purposes, and as may be necessary or proper to protect all such rights in the courts of the State.

3. To enact all laws necessary or proper to protect the people of the State in the full and free enjoyment of the right to appropriate, divert, and use flowing water in the State for irrigation or other beneficial purposes, and so as to fully protect all such rights in the courts.

4. To repeal section 1422 of the Civil Code.

5. To propose and submit to the people of the State an amendment or amendments to Article VI of the Constitution of the State relative to the judicial department, so far as it relates to the Supreme Court.

Notwithstanding the importance of the subjects proposed, the two houses failed to agree on any measure. On March 8, United States Senator John F. Miller, Republican, had died, and on the 23d the Governor had appointed George Hearst, a Democrat, in his place until the assembling of the Legislature. This body, on Aug. 4, elected A. P. Williams, Republican, by a vote of 70, to 24 for Hearst.

Mining.—We give a review of mining operations in the State for the year 1885. California has continued to maintain its place as a producer of gold since the discovery of the metal within its borders. The yield of precious metals for the year was nearly \$10,000,000 in gold and \$4,000,000 in silver. The quartz-mines are especially noteworthy.

New enterprises have been begun, operations have been resumed on several old mines, and in no preceding year since the inauguration of quartz-mining in the State have so few of these establishments been closed.

Calaveras and Amador counties show the greatest activity in quartz-mining. El Dorado County has prosecuted this business with considerable vigor. Nevada County probably is the banner county for quartz-mining; old mines in which their former owners sank fortunes have been reopened, and are now yielding liberally. In Trinity, Shasta, Butte, Sierra, and Plumas counties this industry has already reached large proportions, some of the mills running as high as 60 stamps.

The output of gold has been affected by the closing of the hydraulic mines, but not so seriously as might have been expected.

Drift-mining and river-beds' operations are branches of mining which are only second to quartz-mining at Forest Hill, San Juan, along the Scott, Klamath, and Salmon rivers. They are carried on very successfully, some of the companies employing from 100 to 150 men, and taking out sums varying from \$150,000 to \$400,000 per year.

The owners of gravel claims let out portions of their territory to gangs of Chinamen, and others who work over the surface with under-currents and sluices, and a million dollars is

probably the result of their combined labors for the year.

California is the largest producer of quicksilver in the Union. From 30,000 to 35,000 flasks are produced every year from the mines of New Almaden, Napa Consolidated, Great Western, and Redington. They give employment to 1,000 miners, and about \$4,000,000 is invested in this business.

About 80,000 tons of coal were extracted for the year, principally from Mount Diablo, Ione, and Lincoln.

Copper is also mined in various parts of the State, principally in the southern districts, but owing to depreciation of the price many of the mines have been abandoned, and gold and silver ore containing this rebellious metal can not be worked at a profit.

Wine and Fruit.—Forty million pounds of fresh fruit were shipped out of California by rail between Jan. 1 and Sept. 1, 1885, an increase of 32,000,000 pounds over the shipments for the corresponding period of the previous year. It was said at the State Convention of wine-growers that in 1885 the production of wine in the State was between 15,000,000 and 16,000,000 gallons, and that the requirement for home consumption and export was between 8,000,000 and 9,000,000 gallons. Fully one third of the crop of 1885 was fit only for distillation. In reference to the wine-production of the State in 1875, the total exportation of California wines was 1,031,507 gallons. Five years later the exportation was more than doubled, amounting to 2,487,353 gallons. In 1885, 4,256,224 gallons of wine were exported and 263,840 gallons of brandy.

The vintage of 1886 was the best as well as the largest in the history of California. The yield is estimated at from 17,000,000 to 19,500,000 gallons of wine, of which 3,000,000 will go into brandy. There has been a great increase in acreage of vines, and it is estimated that \$75,000,000 is now invested in the wine interest in California. Equal progress has been made in raisin-culture, and the total product for the year is estimated at 703,000 boxes. It is thought that there are now 8,000,000 fruit-trees in the State. In dried fruit there has been an enormous increase, and all of it has found ready sale. There has been an increase of more than 4,000 per cent. over the product of 1885 in extracted honey.

Riverside, the great orange and raisin growing colony in San Bernardino County, is soon to have the only large cold-storage works for fruit in this country. The establishment will cost \$40,000, and will have capacity for cooling and shipping ten car-loads of fruit daily.

Wool.—The production of California wool has been as follows:

	Pounds.	Pounds.
1880.....	46,074,154	87,415,880
1881.....	45,076,639	36,561,890
1882.....	40,527,119	88,509,160
1883.....	40,848,690	

Wheat, etc.—The Secretary of the State Agri-

cultural Society placed the yield of wheat for the year 1884 at 57,420,188 bushels, or 1,722,605 short tons, produced from an acreage of 3,587.864 acres, averaging 16.40 bushels to the acre, against 32,659,870 bushels, or 979,796 short tons, for the cereal year of 1883-'84.

The crop of the cereal year 1884-'85 has been estimated at 1,250,883 short tons. The acreage of 1886 was about 8,750,000.

The total shipments of wheat by sea from San Francisco in 1886 were 1,100,000 tons; exports of merchandise, \$39,000,000; foreign importations, \$41,941,637; treasure shipment, \$18,713,618. The barley-crop was 39,000,000 bushels, more than three times that of the year before.

Marble.—One of the largest deposits of marble in the world has been discovered in San Bernardino County, three miles from the railroad. It covers six hundred acres, and eleven shades of marble are found. It can be laid down in Los Angeles for \$1 a cubic foot.

CAMEROONS, a German protectorate on the west coast of Africa, extending from the northern boundary of the French possessions in Guinea to the newly proclaimed British protectorate of the Niger country. The German possessions in this part of Africa comprised, in the beginning of 1886, the territories of Togo and Bagid, on the Slave Coast, the district of Bimbia, the island of Nikol, and the coast of Biafra Bay, embracing the territory of the various kinglets on the Cameroons river, and the districts of Malinba, Plantation, and Criby.

About the 1st of April, Capt. Stubenrauch, commanding the imperial gunboat "Cyclop," bombarded and destroyed the village of Money Bimbia, on the southern slope of the Cameroons, the inhabitants of which were under English influence and had become troublesome. Money, the chief, had murdered an uncle of King Bell. Freiherr von Soden, the governor, proceeded to his town in the "Cyclop," and signaled to him to come on board. The chief sent word that the governor must come to him if he wished to speak with him. He was given till the next day to obey the summons, and at the expiration of the time his residence was shelled and the other buildings burned by a landing party. The governor set up another king in the place of Money, who fled.

Herr Schwartz, the African traveler, made an excursion into the interior districts of the Cameroons in January. He followed the caravan route to the Calabar river, and after reaching Bakundu at the limit of previous explorations, advanced eastward into a region of primeval forests, rich in gum-trees and wild coffee, and abounding in elephants, crossed the Kumba river and came to Bason, a picturesque and comparatively well-cultivated country, from which the inhabitants of the coast obtain oil, slaves, and ivory. It is peopled by a tribe called Bafarimi, who are engaged in agriculture and cattle-raising, and have many populous villages. Near the upper Calabar he was stopped

by 500 armed natives, and descended to the coast by Mungo river.

In a note of Lord Rosebery's to the German ambassador in London, dated July 27, 1886, and Count Hatzfeldt's answer of August 2, an arrangement was reached regarding the delimitation of the German and British possessions in West Africa, by which the Germans obtain access to the Benue, which their agent Flegel strove in vain to secure the year before. The German dominion, which by the agreement of May 5, 1885, was bounded by the meridian 9° 8' east of Greenwich and reached only to 5° 30' north latitude on the coast, is extended inland to 9° 40' east longitude, and northward to 8° 20' north of the equator. The coveted interior of the Cameroons region is thus secured to Germany. According to the agreement with France of Dec. 24, 1885, the Congo river as far as 10° east longitude, and a line from that point to parallel 4° of north latitude, mark the limits of the territory of the two nations in this region. By the new arrangements, Germany secures for the Cameroons colony a coast-line of about 400 kilometres, and a depth of nearly 400 kilometres from the mouth of the Rio del Rey to the Benue.

CANADA, DOMINION OF. Cabinet Changes.—The Hon. A. W. McLelan, Minister of Marine and Fisheries, was appointed Minister of Finance in place of Sir Leonard Tilley, who resigned in 1885, and was succeeded by the Hon. G. E. Foster.

Finances.—The revenue for the fiscal year ending June 30, 1885, was \$32,797,001, and the expenditure \$35,037,060. The deficit was due principally to the extra expenditure involved in the suppression of the Northwest rebellion. At the close of the year the war expenses amounted to \$1,697,851. The only previous annual deficits, since confederation, were from 1876 to 1880, inclusive. In 1883 the surplus amounted to \$7,064,492. The following are the per capita statistics for the year, estimating the population at 4,695,864: Gross revenue, \$16.70; gross expenditure, \$16.74; ordinary revenue, \$6.98; ordinary expenditure, \$7.46; gross debt, \$56.87; total assets, \$14.54; net debt, \$41.83; interest paid, \$2.01; interest received, \$0.42; net interest paid, \$1.59. Of the total revenue, 77.39 per cent., or \$25,384,529, was raised by taxation, being \$5.40 per head of the population. Of the amount raised by taxation, \$18,935,428 was in the form of customs duties, and \$6,449,101 excise duties. The net public debt of the Dominion, June 30, 1885, was \$196,407,692, an increase over the previous year of \$14,245,842. The gross debt was \$264,703,607, an increase of \$22,221,191. The interest-bearing assets amounted to \$68,295,915, an increase of \$7,975,350. There has been a total expenditure to June 30, 1885, on Dominion public works, of \$211,542,002. The provincial debts of Canada amount to \$20,762,580, and the interest-bearing assets of the provinces to about \$14,863,422.

Trade and Commerce.—The imports for the year ending June 30, 1885, amounted to \$108,941,486, and the exports to \$89,238,861, a decrease in the former of \$7,455,557, and in the latter of \$2,168,135, as compared with the former year. The foreign trade was distributed as follows:

COUNTRIES.	Imports from.	Exports to.
Great Britain.....	\$41,511,386	\$41,877,745
United States.....	58,095,277	39,752,784
France.....	1,775,172	308,809
Germany.....	2,173,988	264,075
Spain.....	298,314	182,695
Portugal.....	64,603	166,730
Italy.....	116,482	147,550
Holland.....	858,905	24,094
Belgium.....	506,228	72,885
Newfoundland.....	850,398	1,670,968
West Indies.....	8,475,066	2,535,253
South America.....	1,214,904	1,461,206
China and Japan.....	2,557,821	29,918
Australia.....	2,281	415,887
Switzerland.....	221,176
Other countries.....	12,9,635	888,822
Total.....	\$108,941,486	\$89,238,861

Fishery Statistics.—The total value of the catch for the year ending Dec. 31, 1885, was \$17,722,973, being \$48,431 less than in 1884. There was an increase in the value of the cod and lobster catches, and a decrease in the value of the herring and mackerel. These four are, in the order given, the principal produce of the Canadian fisheries. The values were as follow: Cod, \$4,536,731, against \$4,302,454 in 1884; lobsters (preserved), \$2,463,780, against \$2,259,892 in 1884; herring (pickled), \$1,997,901, against \$2,029,430 in 1884; mackerel (pickled), \$1,448,187, against \$1,798,487 in 1884. The export of fish, the produce of Canada, for the year ending June 30, 1885, was \$7,960,001, against \$8,591,654 for 1884. The fisheries gave employment to 59,493 men, 1,177 vessels and steam-tugs, of a total tonnage of 48,728, and 28,472 boats. About \$7,000,000 of capital is invested in the business.

Legislation.—One of the most important acts of the session of the Dominion Parliament in 1886 was the Northwest Territories Representation Act. The act makes the provisional districts of Saskatchewan and Alberta electoral districts, returning one member each to the Canadian House of Commons, and divides the provisional district of Assiniboia into two electoral districts, each returning one member. To render this act valid, the Imperial Parliament passed the British North America Act, 1886, authorizing the Parliament of Canada, from time to time, to make provision for the representation in the Senate and House of Commons of Canada, or in either of them, of any Territories that for the time being form part of the Dominion but are not included in any province thereof. The act is made retroactive, so as to sanction the act passed by the Canadian Parliament. There are now three British North America Acts of the Imperial Parliament—i. e., of 1867, 1871, and 1886. By the Dominion Act the electoral franchise in the Northwest

territories is conferred upon every *bona-fide* male resident and householder, of adult age, who is not an alien or an Indian, and who has resided in the electoral district twelve months before the issue of the writ of election. Voting is to be open, not, as in the provinces, by ballot. Voters may be required to swear, not only as to their identity qualifications or disqualifications, but also that they have not been bribed.

Mr. Charlton's bill, to punish seduction and like offenses, and to make further provision for the protection of women and girls, passed in previous sessions by the House of Commons, but thrown out by the Senate, became a law this year. The act makes it a misdemeanor, punishable by two years' imprisonment in a penitentiary, or for a less term in any other place of confinement, to commit any of the following offenses: To seduce or attempt to seduce any girl, of previously chaste character, between the ages of twelve and sixteen years. To have or to attempt to have carnal knowledge of any female idiot or imbecile woman or girl, under circumstances that do not amount to rape. To procure or assist in procuring a feigned marriage. Being over twenty-one years of age, to seduce under promise of marriage any unmarried female of previously chaste character under eighteen years of age. Having the control of any premises, to induce or knowingly suffer any girl between the ages of twelve and sixteen years to be upon such premises for the purpose of being unlawfully known by any man. If such girl is under the age of twelve years, the owner of the house is guilty of felony, and liable to ten years' imprisonment. It is a sufficient defense to this section to show that the accused had reasonable cause to believe the girl to be above the age of sixteen years. No person can be convicted of any offense under the act upon the evidence of one witness, unless that witness is corroborated in some material particular by evidence implicating the accused. A defendant is a competent witness in his own behalf upon any charge under the act; and no prosecution can be begun after the expiration of one year from the time of committing the offense.

Politics.—The government of Sir John Macdonald met Parliament this session amid the greatest uncertainty as to its fate. By the defection of a large but then uncertain number of the Quebec Bleus (hitherto the stanchest section of the Conservative party), on account of the execution of Louis Riel, Sir John's great majority had been seriously impaired; but upon a vote of censure with reference to the execution it was mere matter for speculation to what extent the votes of the bolters would be set off by the support of English Liberals. On March 25, at 2.30 A. M., after a long and exciting debate, a vote was taken on Mr. Landry's motion:

That this House feels it its duty to express its deep regret that the sentence of death passed upon Louis

Riel, convicted of high treason, was allowed to be carried into execution.

The vote in support of the Government was: English Conservatives, 97; French Conservatives, 25; English Liberals, 24; total, 146. The vote against the Government was: English Liberals, 24; French Liberals, 11; French Conservatives, 17; total, 52. Thus the Government obtained an unexpected majority.

On motion to go into Committee of Supply, made June 2, an amendment was moved "that in the administration of Northwest affairs under the present ministry prior to the rebellion, there were grave instances of neglect, delay, mismanagement, and misconduct, which were prejudicial to the public welfare, produced serious discontent among the people, and retarded the development of the country." This amendment was negative by a vote of 71 against 51, and the Government was thus sustained, not only upon its policy in regard to the execution of Riel, but also upon its administration of the Northwest Territories in regard to which it was generally considered throughout the country to be much more vulnerable. Although supported in Parliament, the Government found little encouragement to appeal to the country. At a by-election in the county of Haldimand, Ont., an English constituency, the cry of "French domination!" was raised in the interests of the Government candidate; but he was defeated, and Cabinet ministers had entered so energetically into the electoral campaign that, although the county has always been Liberal, the defeat was regarded as a severe blow for the Government. The chief significance of the result was, that the cry of "French domination!" was not likely to prove as effective in Ontario as the Riel cry in Quebec. The Hon. Mr. Chapleau, Secretary of State, caused the constituency of Chambly, in the province of Quebec, to be opened, for the avowed purpose of destroying the prestige of the Parti National by demonstrating that the Riel cry could not carry a Quebec county. But the Riel candidate was victorious. In the provincial general elections in Nova Scotia and Quebec the Liberals were also triumphant.

The Fisheries.—As related in the "Annual Cyclopædia" for 1885, the fishery clauses of the treaty of 1872 between the United States and Great Britain expired on June 30, 1885, and the perplexing treaty of 1818 was thereby revived. Fish imported into the United States from Canada immediately became subject to import duties; but the Dominion Government, with the hope of preventing unpleasantness, agreed not to enforce the restrictions of the revived treaty against United States fishermen until Congress had had an opportunity of authorizing new arrangements. Congress having declined to agree to either a new treaty or the appointment of an International Commission, the Dominion Government made preparations to enforce, from the beginning of the season of 1886, the restrictions of the treaty of 1818.

A fleet of swift, armed cruisers was fitted out to patrol the fisheries. Not only the provisions of the treaty, but the customs regulations, hitherto very leniently interpreted, were now rigorously enforced. American fishing-vessels were forbidden to enter Canadian waters for any other purposes than the four specified in the treaty of 1818. The instructions to the commanders of the cruisers were secret; but the powers granted them were much more extensive than those intrusted to the collectors of customs. The captains were authorized to make seizures at their own discretion, of course within the limits of their private instructions. The collectors were instructed to detain suspected vessels for twenty-four hours, and report each case to the Government at Ottawa for further action. This distinction, necessitated from the fact that the collectors were not appointed to deal with the delicate questions likely to arise, and that, in fact, not all of them were qualified to do so, gave rise to a wrong impression. A circular, issued to the collectors on June 11, was for some time generally considered a modification of the Canadian Government's claims. It was assumed that American fishing-vessels might remain in Canadian ports for twenty-four hours without molestation. Such, however, was not the intention of the Government, which simply instructed collectors to seize any American fishing-vessels remaining in port twenty-four hours after being warned to depart, although they might not have broken any law otherwise than by hovering within the three-mile limit. It was never intended to concede any privilege not included in the treaty. The treaty allows American fishing-vessels to obtain wood in Canadian ports; the Government allows coal to be shipped as a substitute, if intended for cooking, but not if intended to supply motive power; because, it is argued, at the time the treaty was made coal was not used as a motive power.

Much indignation was created in the United States by the refusal of the Canadian officials to recognize the permits granted to American fishing-vessels by American customs collectors to "touch and trade" at Canadian ports. The action of the Canadian officials was supposed to be in contravention of legislation passed subsequent to the treaty. But a broad distinction is insisted upon by the Canadian Government between fishing-vessels and trading-vessels—a distinction that has always been recognized at the custom-house. An American merchant-vessel in a Canadian port is only expected to comply with the customs regulations. An American fishing-vessel is further expected to comply with the requirements of the treaty of 1818.

On May 7, the schooner "David J. Adams," of Gloucester, Mass., was seized in Digby Basin, N. S., by Capt. Scott, of the Dominion cruiser "Lansdowne." The schooner was accused of violating the customs regulations by remain-

ing twenty-four hours, or more, in port without reporting to the collector of customs, and of violating the act relating to fishing by foreign vessels by buying bait. The seizure was formally protested against by the master of the schooner, and also by United States Consul-General Phelan. An action was entered against Capt. Scott for \$12,000 damages; and another was brought against Henny, master of the "David J. Adams," for \$1,000 penalty for violating an imperial statute of 1818. In the latter case no defense was offered, and judgment was entered against the defendant for the full amount. The trial of the "David J. Adams" case was arranged to be held at Halifax.

Subsequently, the "Ella M. Doughty" was seized at Englishtown, Cape Breton, for buying bait at St. Ann's. The plea filed for the defense in this case set up that the purchase of bait or ice is not prohibited by any imperial or Canadian statute or order in Council; that the imperial statute of 1819 being still in force, all Canadian legislation on the same subject is null and void; that since the treaty of 1818 and the imperial statute of 1819 were admitted to be in force, further privileges have been conceded to United States vessels; that the "Ella M. Doughty" was under United States law licensed to touch and trade at foreign ports; that the vessel entered St. Ann's for shelter, and not for bait, but the captain purchased bait that was offered him, intending to use it solely beyond Canadian limits; that the vessel neither fished, took fish, dried fish, cured fish, nor prepared to fish within three marine miles of any Canadian coast or bay; that the port of St. Ann's is a commercial port of Canada into which vessels may enter and depart from, subject only to the customs regulations; and that so much of the treaty of 1818 as provides that fishermen shall be permitted to enter bays and harbors for the purposes therein set forth, has relation to bays and harbors generally; but that with reference to St. Ann's and all other harbors constituted commercial ports, there did not exist, either in the laws of Great Britain or Canada, or in any treaty or convention, any prohibition against the entry into such ports, in time of peace, of any vessel whatsoever belonging to a friendly nation, for the purpose of obtaining necessary or reasonable supplies for their reasonable voyages and occupations; that pursuant to a royal proclamation of Nov. 6, 1830, United States vessels were authorized to export freely goods from Canada to any foreign country, and that by subsequent legislation of the Imperial Parliament all registered and licensed vessels of the United States, as to voyages from and to British ports, and as to trading at such ports as incidental to such voyages, were made subject to the same prohibitions and restrictions, and none other, to which British vessels similarly engaged were then subject; so that the "Ella M. Doughty" was fully authorized to purchase bait.

On July 2, the schooner "City Point," of Portland, Me., put into Shelburne, N. S., the captain claims, for the purpose of getting her decks calked; the Canadian authorities allege that it was to obtain a prearranged supply of bait. Two men were landed, and water was taken on board, before the vessel reported at the custom-house. The vessel was detained by the collector of customs, and then upon instructions from the Dominion Government was seized for violating the customs laws, by the cruiser "Terror." Two other Portland schooners—the "C. B. Harrington" and George W. Cushing"—were also seized at Shelburne. All three were subsequently released upon deposit of fines of \$400 each by Consul-General Phelan, the deposit being made upon condition that the amount be returned in case the seizures should be declared illegal.

On Aug. 18, the mackerel-schooner "Howard Holbrook," of Gloucester, Mass., was seized at Port Hawkesbury, C. B., by the collector of customs, for having violated the customs laws three weeks previously by calling at the same port without reporting at the custom-house. The vessel was released on payment of \$200.

The first vessel seized for fishing within the three-mile limit was the "Highland Light," which was seized on Sept. 1 by the cruiser "Howlett" while in the act of fishing within a mile and a half of the shore, near East Point, P. E. I. Among other vessels seized for not reporting at custom-house were the "Pearl Nelson," of Provincetown; the "Marion Grimes," of Gloucester; and the "Everett Steele," of Gloucester. The latter was seized by the cruiser "Terror" in September, for having put into Shelburne in March without reporting. Fines of \$400 were imposed in each instance.

It is not easy to determine whether the United States or Canada suffered the more by the revival of the Washington Treaty. In spite of the duties, the Canadian fishermen exported large quantities of fish to the United States, at unusually high prices. American fishermen suffered less from being excluded from the Canadian fishing-grounds than from being denied facilities for obtaining supplies and forwarding fish by rail. The greatest sufferers were the numerous Canadians, who in the past have lived by selling supplies to the American fishermen. Considerable excitement was created among the classes directly interested on both sides of the frontier. The New England fishermen seemed to regard every seizure, not as a matter of police, but as an act of war. The United States Government, while strongly favoring a new treaty or the appointment of an international convention, took exception to the Canadian Government's method of enforcing its interpretation of the existing treaty. The United States Government insisted that the British headlands doctrine is false and untenable; that seizures ought not to be made on suspicion, but only if

a vessel is actually engaged in fishing within the limits; that under the treaty of 1818 American fishermen have the privilege of going into Canadian ports without vexatious custom-house formalities, which privilege is distinct from the general right of American vessels to trade in open Canadian ports under the usual custom-house restrictions; that custom-house regulations must be enforced in a friendly, not in a hostile, spirit; and that excessive fines must not be imposed. Congress passed an amendment to a shipping bill then being discussed, which authorized the President to issue a proclamation at any time, denying commercial privileges in American ports to the vessels of any foreign country denying commercial privileges in its ports to American vessels. In August three sealing-vessels belonging to Victoria, B. C., were seized in Bering Sea by the United States revenue cutter "Corwin." The question involved in this seizure is that of the territorial rights of the United States in Bering Sea, the vessels having been seized while within sixty miles of Alaska.

The Dominion Parliament passed the following amendment to the act respecting fishing by foreign vessels in Canadian waters:

Any one of the officers or persons hereinbefore mentioned may bring any ship, vessel, or boat, being within any harbor in Canada, or hovering in British waters within three marine miles of any of the coasts, bays, creeks, or harbors in Canada, into port and search her cargo, and may also examine the master upon oath touching the cargo and voyage; and if the master or person in command does not truly answer the questions put to him, in such examinations, he shall incur a penalty of \$400. And if such ship, vessel, or boat is foreign, or not navigated according to the laws of the United Kingdom or of Canada, and (a) has been found fishing or preparing to fish, or to have been fishing, in British waters within three marine miles of any of the coasts, bays, creeks, or harbors of Canada, included within the above-mentioned limits, without a license, or after the expiration of the term named in the last license granted to such ship, vessel, or boat, under the first section of this act; or (b) has entered such waters for any purpose not permitted by the law of nations, or by treaty or by convention or by any law of the United Kingdom or of Canada, for the time being in force, such ship, vessel, or boat, and the tackle, rigging, apparel, furniture, stores, and cargo thereof shall be forfeited.

CAPE OF GOOD HOPE, a British colony in South Africa. The legislative authority is vested in a House of Assembly, consisting of seventy-four members, elected by limited suffrage for five years. The Governor is Sir Hercules G. R. Robinson, who is also High Commissioner for South Africa. The Premier is Sir Gordon Sprigg.

Area and Population.—The area of Cape Colony proper is 199,406 square miles; the population is about 895,000, comprising 315,000 persons of European origin, of whom 140,000 are of English and 175,000 of Dutch and French Huguenot descent, and 580,000 natives of different tribes. The annexed district of Griqualand West has an area of 17,800 square miles, 16,927 white inhabitants, and 32,174 others. Other districts under the administration of the Cape

Government are a part of the Transkei, 14,230 square miles in extent, with a native population of 84,115 souls; Griqualand East, with 78,352 native inhabitants; and Tembuland, with 98,530. Basutoland, with an area of 10,293 square miles, and 127,707 indigenous inhabitants, and 469 resident whites, is now administered by a resident commissioner under the direction of the High Commissioner of South Africa. Including Basutoland the population of Cape Colony and its dependencies numbers 287,121 Europeans and 962,603 others.

Commerce.—The declared value of the exports in 1884 was £3,938,981. The exports of gold and diamonds, not included in this sum, bring the total value of the exports up to £6,945,674. The imports, which two years before amounted to £9,372,019, were in 1884 £5,249,000. The value of diamonds exported in the regular way in 1884 was £2,807,329, making the total product of the mines since 1867, £29,772,576. The export of wool fell off from £2,062,180 in 1882 to £1,745,193 in 1884; of ostrich-feathers, from £1,093,989 to £966,479; of Angora hair, from £253,128 to £239,573. The export of hides and skins increased from £403,357 to £438,365; of copperore, from £394,032 to £405,415; of wine, from £11,658 to £17,701.

Agriculture and Industry.—Cape Colony has passed through a period of depression since 1878, owing partly to the colonial wars waged against the Galekas and Basutos; partly to the expulsion of natives from lands which they tilled, by the Cape Dutch, who converted the land into pasture, and the consequent extinction of native markets; partly to over-speculation in the production of diamonds, Angora hair, and ostrich-feathers, and the fall in the prices of those articles and of wool. The diamond industry, the most important one in the country, is believed to have reached a point where the cost of production is nearly equal to the value of the product. It has been very beneficial in teaching the natives to work for wages, and will give employment to a large population for at least a hundred years. The new gold industry is capable of indefinite expansion. Besides the rich quartz-ledges in the Transvaal, the exploitation of which has only begun, there have been promising discoveries in Tongaland, and far in the interior, in northern Bechuanaland, near the Zambesi; and in other regions farther north there are areas where alluvial gold has long been known to exist. The copper-mines of Namaqualand, worked by an English company, is an important industry. Coal exists in large quantities in the colony, but the mines are not developed. The agricultural development of South Africa has not yet begun, though the soil in many places is well adapted to the growth of crops. The Dutch farmers, who have held nearly all the land hitherto, are exclusively pastoral. They raise large quantities of wool, but, owing to careless breeding and shepherding, the prac-

tie of shearing twice in the year, and that of mixing fleeces of different qualities and colors in the same bale, the prices are much lower than are obtained by Australian wool-growers. The Cape wool has deteriorated in quality, and the production per acre has decreased, because the wars and the newly-developed industries have diverted the attention of farmers to other occupations, especially the profitable carrying business. The land is capable of feeding a sheep to the acre, instead of one to four acres, as at present. The farmers have begun to fence their lands, and some of them to irrigate by means of wells and windmills. Irrigation is necessary for grain-crops. Of the 200,000 square miles of territory in the colony, not over 850 are under cultivation. A large part of the farms are heavily mortgaged to English and German money-lenders. The Dutch farmers will, therefore, probably be compelled to devote themselves more to agriculture, or make way for other occupants. Grapes constitute one of the chief crops at present. There are 15,000 acres in vineyards. The vine flourishes exceedingly, and some of the vine-growers produce excellent wine at a cost of less than twenty cents a gallon; but most of the wine and brandy is of such poor condition that there is no demand for them abroad, and only at the Cape on account of the prohibitive tariff.

Railroads and Telegraphs.—In September, 1885, the Government railroads had a total length of 1,523 miles; their capital cost was £13,229,218; their gross earnings in 1884 were £964,903; their net earnings, £327,462.

The telegraph lines at the close of 1884 had a total length of 4,219 miles. The number of messages in 1884 was 740,791.

Finances.—The revenue receipts in 1884-'85 amounted to £3,321,958. The estimated expenditure was £3,502,601. Owing to the falling off of the revenue, during a period of depression, the Government has been compelled to resort to retrenchments in the expenditures. A bill abolishing excise duties, passed in June, reduces the revenue by £100,000. The colony had a debt, in 1885, of £20,804,000.

Gold - Fields.—The gold-mining industry in South Africa has sprung up within two years, having received its first impetus from the discovery of rich fields in the Eastern Transvaal and the adjoining native territories. In the early fall new discoveries in the De Kaap and Witwatersrand districts attracted streams of diggers from all parts of South Africa. The population of Barberton quickly doubled. There was a total capital invested by mining companies in South Africa of about \$10,000,000, while the shares were worth double that amount in the market. Some of the companies engaged in quartz-mining possessed the necessary machinery, and were making large profits, while many others had not begun to develop their properties. The Sheba Reef Company, which has obtained 7 ounces, 6 pennyweights, 9 grains from every ton of quartz,

after the first six months' operations reported a gross profit of £20,031, with £3,175 of total expenses, giving a net profit exceeding the paid-up capital of £15,000. In this mine the auriferous rock is simply quarried. The Witwatersrand field lies between Pretoria and Heidelberg, in the Transvaal. Many mining claims in this district have been secured by Kimberley capitalists. On one farm four consecutive conglomerate gold-bearing reefs of an average thickness of 23 feet, and 3½ miles in length, have been discovered 100 feet below the surface. Many other reefs have been found in the neighborhood. The yield here is about 1 ounce per ton, paying between four and five times the cost of extraction. The auriferous formation in the Transvaal runs entirely across the country, almost along the parallel of 26° south, from the Limbobo mountains in the east to the border of British Bechuanaland in the west. A valuable reef has been found on the Malmani river, 14 miles from Mafeking. Gold-bearing quartz-veins exist in the Knysna, within the Cape Colony, but it has not been determined whether they are rich enough to pay for working. Experiments with quartz found in the Zulu Reserve did not prove altogether satisfactory.

Bechuanaland.—The protectorate of Bechuanaland was proclaimed on Jan. 27, 1885. The area, including the new district of Stellaland, is about 180,000 square miles, the population 478,000. The Imperial Government proposed to hand over the administration to the Cape Government, but the latter, in July, 1885, insisted that the cost of the mounted police should be borne by the Imperial Government, which, therefore, undertook the administration. A constabulary of 500 men was organized. The cost of the annexation was about £1,000,000. For the first year's civil administration the British Parliament voted £75,000, besides the sum required for the subsequently annexed district of Stellaland, which was first organized as a republic, and then taken into the British protectorate, on the condition that land-titles acquired from the natives should be respected. A land commission was appointed on Oct. 1, 1885, with S. G. A. Shippard, who was also appointed political administrator, as chief commissioner. The Government prohibited sales of liquor to the natives; yet they obtained it surreptitiously from the traders at Vryburg, in Stellaland, in such quantities that drunkenness began to prevail among the chiefs and people, except in the territories of the Chief Montsioa, who was able to control his subjects. While the land courts were sitting, in January, 1886, Mr. Shippard issued a proclamation declaring that meetings held to influence their decision would be punished as contempt of court. The inhabitants of Rood Grond were incensed at the decisions of the land court, which denied their claims to farms in Moshette's territory.

Upingtonia.—A new republic, called Upington-

nia, was established about the 1st of January in Ovamboland, north of Damaraland. The right to the territory was purchased from the native tribes, and land was offered to European settlers free of charge. The district, 300 miles long and 120 miles broad, is situated 200 miles from Walvisch Bay. Many Boers and Englishmen moved in and began the cultivation of the land, which is adapted for the growth of wool, grain, and wine. The settlers, who took possession in order to forestall German occupation, requested to be taken under the rule of the Cape Government.

Pondoland.—The Xesibe country, a part of the tribal territory of the Pondo, was, in September, 1886, annexed to Cape Colony without the consent of the Pondo. The port of St. John's river was also annexed. The Xesibes, feeling secure under colonial protection, began to make raids into Pondoland. The Pondo, who have always lived heretofore on friendly terms with the British, had done all that they could to secure peace, sending a deputation, in 1885, to the High Commissioner. The British authorities endeavored to obtain from the Pondo a trade and military route through their territory, and opened negotiations in January, 1886, with the paramount chief, Umquikela. They obtained a cession from one of the chiefs, but Umquikela refused to recognize its validity, and rejected an offer to buy the right of way through his dominions. But as the party in power at the Cape was desirous of annexation, nothing was done to prevent the troubles, which resulted in the annexation of Xesibeland, after an incursion of Pondo in retaliation for cattle-thiefs.

Zululand.—When Cetewayo, who, after the Zulu war, had been at first imprisoned at Cape Town, and then brought to London, where he became a popular character, was restored to his kingdom, the fertile region next to Natal was reserved for discontented Zulus, who preferred to live under British administration to coming under the rule of their old monarch. The northeast corner of Zululand was ruled by Usibepu, a powerful chief, who refused to acknowledge Cetewayo, and was therefore left independent in the arrangement for Cetewayo's return. In a short time Usibepu and the dispossessed chiefs drove out Cetewayo, who died a fugitive in the Reserve, poisoned by his enemies, as has been since ascertained. Usibepu then attempted to make himself master of the whole country, and to resist him the Usutus called the Boers to their aid. In return for helping the Usutus overthrow Usibepu, the Boer volunteers from the Transvaal obtained from Cetewayo's son, Dinizulu, who was crowned King of the Zulu nation, a grant of 2,600,000 acres of land. They founded the Republic of Western Zululand in October, 1885, and laid claim to St. Lucia Bay, where they proceeded to settle; but this latter action provoked the interference of the British authorities. By January, 1886, the Boers in Zululand had appor-

tioned out 800 farms of 3,600 acres each, situate partly in Western Zululand and partly in the district along the coast skirting St. Lucia Bay, over which the new republic had proclaimed sovereign rights. The quantity of land ceded by Dinizulu to the Boers was nearly five sixths of Zululand outside of the British Reserve, and, according to English computations, left not land enough to support one third of the Zulus. The British authorities warned Lucas Meyer, the President, and the other citizens of the Boer Republic, that they would not recognize the survey nor the occupation of the lands as conferring a valid title, or as affecting the British or the Zulu rights previously existing; also that they would not permit the occupation of St. Lucia Bay, or of the adjacent territory to the north and west of the bay. In April, 1886, Earl Granville offered to the Boers a settlement, recognizing their rights to a part of the land then occupied, but the Boers rejected the terms offered. In the mean time they began to settle in the neighborhood of the sea-coast, near St. Lucia Bay, which port was desired by the Transvaal people as a terminus for a railroad. The British Government had sought to defeat the railroad project by proclaiming a protectorate over the coast at that point. The Boers, in the allotment of farms, respected the British protectorate by leaving to the British the sandy strip of shore-lands. Some of the natives displaced by them were driven into the Reserve. The Natal colonists who, while they are unable to utilize new lands, are eager to annex fertile districts for the future expansion of the colony, and because they can draw a revenue from them by imposing a hut-tax on the native occupants, proposed by a vote of their Legislative Council to have Zululand annexed to Natal, although they have repeatedly refused responsible government on the plea that they can not assume the risks and the expense of managing their present native population, and of guarding their frontier.

The portion of Zululand that the British Government offered to relinquish to the Boers in the negotiations of March and April comprised the territory of the new republic that was first settled before its extension toward the sea. In September Sir Arthur Havelock, Governor of Natal, reopened negotiations, on behalf of the Imperial Government, with the Boers of the Zululand Republic. The latter claimed 800 farms under title-deeds already granted, and the suzerainty over the whole of Zululand, except the Reserve. They were willing to abandon the rights of suzerainty, subject to the consent of the Zulus, but would not agree to give up 250 of their farms also, as the Governor demanded.

An agreement was signed, by Sir Arthur Havelock and the Boer representatives, on Oct. 22. The Republic of Western Zululand was recognized by the British Government. The Boer protectorate over the country was abol-

ished, and a British protectorate established over the entire coast. Eastern Zululand was reserved for the Zulus, with a British protectorate, if they desired. A part of Central Zululand is included in the district assigned to the Zulus, who also retain Ulundi; but the most valuable portions go to the Boers, whose boundary extends to within 40 miles of the sea. The roads are free, and missionaries will be at liberty to go everywhere. In return for their claims near the sea-shore, the Boers received the valuable district of Umgungane, to the north of their republic, in which there were few natives, and another rich district, already fully occupied by the Boers, on the southeast. The people of Natal objected to the settlement, and the Legislative Council of the colony, in order to bring pressure on the Governor, voted against financial and other Government proposals, and even reduced the Governor's salary. They desired the annexation to Natal of the Reserve and Eastern Zululand, if not of the new republic, and insisted on a free-trade route through Zululand.

CHEMISTRY. Chemical Philosophy.—The most valuable contribution to the subject of chemical philosophy during the year was Prof. William Crookes's inaugural address as President of the Chemical Section of the British Association on the nature and possible origin of the chemical elements. Of the attempts, he said, hitherto made to define or explain an element, none satisfy the mind. Such definitions as those given in the text-books, that an element is a body which has not been decomposed, or a something to which we can add, but from which we can take nothing away, are doubly unsatisfactory. They are provisional, and may cease to-morrow to be applicable to any given case. They are based not on any attribute of the thing to be defined, but on the limitations of human power. The idea that the elements are capable of further decomposition is not new in chemistry, but has been broached by Faraday, Herbert Spencer, and others. Mr. Lockyer has shown that in the heavenly bodies of the highest temperature, a number of our reputed elements are dissociated, or have never been formed. Prof. Stokes suggests that a certain line in the spectrum of the nebulae may indicate some form of matter more elementary than any we know. It is important to keep in mind the idea of the genesis of the elements; and still more important to keep in view the probability that there exist in Nature laboratories where atoms are formed, and laboratories where atoms cease to be. Are the distinctive properties of our elements accidental or determinate? Why might there not as well have been 7 or 700, or 7,000 absolutely distinct elements as the 70 (in round numbers) which we recognize? If the peculiarities of the elements were accidental, they could hardly display the mutual relations which are brought out in the periodical classification. May they not have been evolved from some few antecedent

forms of matter, or possibly from one such, as it is now held that the variations of animals and plants have been developed from fewer and earlier forms of organic life? It must be admitted that we have no direct evidence of the transmutation of any supposed element into another, or of its resolution into anything simpler. But there is indirect evidence bearing on the point. Herschel and Clerk-Maxwell have concluded that atoms bear the impress of manufactured articles. Prout's hypothesis that the atomic weights of the other elements are multiples of that of hydrogen, has not been borne out by the more accurate determinations of them, but coincidences which should not be disregarded are presented in those determinations. The discrepancies may possibly be reconciled if we supposed the unit of atomic weight to be possessed not by hydrogen, but by some body as yet not found, whose atomic weight is less than that of hydrogen. Such a body may be the hypothetical element *helium*, whose lines are revealed in the spectrum of the sun.

Other evidence on this point is furnished by certain peculiarities in the occurrence of the elements in the earth's crust. Many of them are found in groups of associated members having peculiarities that indicate common affinities; as in the case of nickel and cobalt, the two groups of platinum metals; and the so-called "rare earths" which occur in gadolinite, samarskite, etc. Some of the peculiar features of the rare earths, yttria, samaria, holmia, erbia, etc., seem to point to their formation generally from some common material placed in each case in conditions nearly identical. The compound radicals, with their analogy with accepted elements, also throw light on this view.

Dr. E. J. Mills has suggested that our present elements are the results of successive polymerizations which have taken place in the process of the cooling of matter from its pristine intensely heated condition. Measuring the natural increase in density of chemical substances in cooling as a function of time or of temperature, we may sometimes observe that there are critical points corresponding to the formation of new and well-defined substances, as when phosphorus is converted into the red variety. We might then account for the formation of the elements, by conceiving the original existence of matter in an ultra-gaseous state that may be called *protyle*, at a temperature inconceivably hotter than any now known, and even above the dissociation-point of atoms. In course of time the temperature of protyle is reduced to a point at which granulation takes place; matter, as we know it comes into existence, and atoms are formed with their potentialities of energy, including that of atomic weight. Acting on the neighboring protyle, they accelerate the formation of other atoms. We need not suppose that all the elements were simultaneously created; but that the

easiest formed one, the one most nearly allied to *protoyle* in simplicity, came into being first. This would be hydrogen, or helium, or the element having the simplest structure and the lowest atomic weight. Between this and the formation of the next element in order of simplicity would be a considerable gap in time, during which its atomic weight, affinities, and chemical position would be in course of determination. The longer the period occupied by the condensing of the *protoyle* into new atoms, the more sharply defined would be the resulting elements; and, with more irregularity in the cooling, we should have a nearer approach to the state of the elemental family as we now know it.

Prof. Thomas Carnelly, in a paper on the physical properties of the normal halogen and alkyl compounds of the hydrocarbon radicals, points out numerous relationships, which, with one exception, are similar to those which he has shown to exist between the normal halogen or the alkyl compounds of the elements. It appears that the physical properties of the following four classes of compounds obey the same rules: 1. The halogen compounds of the elements—that is, of elements with elements; 2. The alkyl compounds of the elements; 3. The halogen compounds of the hydrocarbon radicals; 4. The alkyl compounds of the hydrocarbon radicals—that is, of hydrocarbon radicals with hydrocarbon radicals. A careful consideration of these points leads almost irresistibly to the conclusion that the elements are analogous to the hydrocarbon radicals in form and function; and this, if true, will lead us to infer that the elements are not elements in the strict sense of the term, but are built up of (at least) two primary elements, A (= carbon at. wt. 12), and B (= ether at. wt. —2), which by their combination produce a series of compounds (viz., our present elements), which are analogous to the hydrocarbon radicals. If this theory of the constitution of the elements be true, the periodic law would follow as a matter of course, and we should therefore be able to represent the elements by some such general formula as $A_n B_{2n} + (2 - x)$, analogous to that for the hydrocarbon radicals, $C_n H_{2n} + (2 - x)$, in which n = the series and x the group to which the element or hydrocarbon radical belongs.

Prof. Ramsey, in a recent paper on the subject, has affirmed the non-existence of nitrogen trioxide. After pointing out the inconclusive character of Lunge's argument in support of the existence of this substance in gaseous form, inasmuch as the use of any reagent may either decompose the gas or react with the products of its dissociation—viz., N and N_2N_4 (N_2) as though they consisted of N_2O_3 itself—the author showed the only criterion of the existence of the gas to be its vapor-density. The results of experiments made to determine this point were regarded by him as deciding the question against the existence of gaseous nitrous trioxide.

Chemical Physics.—The tabulated results of Raoult's experiments on the action of dissolved substances in lowering the freezing-point of solutions show that different salts of the same group—i. e., containing the same number of metal atoms in the molecule—show nearly the same molecular depression of the freezing-point. The value of the molecular depression produced by any salt is obtained by multiplying the lowering of the freezing-point of a solution containing one gramme in 100cc. of water by the molecular weight. The salts experimented upon are classified into two series: 1, according to the value of the metallic constituents, and 2, according to the value of the negative or metalloid substance. The first group of the first series, consisting of salts containing only one atom of the monad metal, gives values for the molecular depression varying from 27 to 36. The second group, the salts of which contain two atoms of monad metal, gives the value 40. In the third group, in which three monad-metal atoms are combined in the molecule, the value is 48; in the fourth it is 47, and in the fifth 48. The second series contains the salts of the dyad metals, and the molecular depression does not exceed 53, the values being from 41 to 48 for the salts of monobasic and 18 to 22 for those of dibasic acids. Comparing the two series, it appears that, whenever in a molecule of a salt dissolved in 100cc. of water one atom of alkali-earth or earth-dyad metal is replaced by an equivalent quantity of a monad metal, the lowering of the freezing-point increases by a nearly constant quantity, viz., about 21. Referring the matter to equivalents, the author states his results: If, in the solution of an alkali-salt containing an equivalent of the salt in 100cc. of water, the monad metal be replaced by an equivalent quantity of a dyad or polyad metal, the depression of the freezing-point is diminished by a quantity sensibly constant and equal to 10.5. With regard to acids, the law is that if in the solution of a salt of a strong monobasic acid containing one equivalent of the acid in 100cc. of water the monobasic acid be replaced by an equivalent quantity of a strong dibasic acid, a diminution of the depression of the freezing-point is observed, which is nearly constant, and approaches 14. From these data the author calculates the depression due to the separate radicals.

Experiments by Prof. W. A. Tilden on the phenomena of solution of sodium sulphate at different temperatures establish the fact that the thermal change in dissolving the anhydrous salt in water at temperatures above 33° C. is still positive, although a diminishing quantity, and hence that the act of solution is still attended, at these temperatures, by chemical combination between the salt and the water.

W. Spring, in the course of experiments in applying pressure, rising in some cases to 10,000 atmospheres, obtained from filings of those

respective metals, blocks of lead, bismuth, tin, zinc, aluminium, copper, antimony, and platinum, that seemed to have all the properties of homogeneous metals. Lead, under a pressure of 5,000 atmospheres, no longer resisted the piston of the apparatus, but behaved as a liquid would have done under similar circumstances; and, when the apparatus was opened, thin coatings of the metal were found everywhere, having the appearance of those obtained by plating. Prismatic or amorphous sulphur was converted into an opaque block of rhombic sulphur, harder than that obtained by fusion. Amorphous phosphorus gave evidence of transformation into the crystalline variety. Precipitated zinc sulphide gave a very hard, compact mass with a gray, metallic-lustered outside, and the appearance of a mass of transparent crystal fragments within. The sulphides of lead and arsenic were obtained with the properties of the natural minerals to a greater or less extent. Copper filings and coarsely pulverized sulphur combined chemically into a black, crystalline mass. A coarse mixture of mercuric chloride and copper filings became cuprous chloride and mercury; and dry potassium iodide and dry mercuric chloride formed a red block of iodide of mercury and potassium chloride. Usually the product obtained had a smaller volume and a greater specific gravity than those of the substances used. These observations have been called in question by Friedel and Jannetaz, of the French Chemical Society, who have subjected various bodies to similar pressures without getting complete union. Jannetaz obtained solid blocks, apparently homogeneous, of several metals; but they all proved to be only schistose in structure, or to allow heat to be propagated through their masses less easily in the direction of the pressure than perpendicularly to it; and they assert that not a homogeneous but only a schistose structure was produced in Spring's experiments.

M. Wroblewski has experimented with liquefied oxygen as a refrigerating agent, and finds some difficulties in using it. Among them is the fact that, when liquefied in large quantity and suddenly allowed to evaporate by release, it does not solidify like carbonic acid, but leaves a crystalline residue on the bottom of the apparatus and on the object plunged in it to be cooled. Another difficulty consists in the necessity of using the liquefied oxygen in closed vessels of very great strength. The apparatus being partly constructed of glass, much inconvenience is caused by the constant danger of serious explosions. For this reason masks are now worn in the experiments. The greatest difficulty is the very short duration of the ebullition, and the too short time of the refrigeration. The temperature produced by the sudden release from pressure of liquefied oxygen is approximately measured at -186° C .

The same investigator, having compressed

hydrogen to 100 atmospheres in a vertical tube and cooled it by successive ebullitions of oxygen, noticed, when the gas expanded after a sudden release from pressure, an ebullition analogous to that observed by M. Cailletet in oxygen, taking place a short distance from the bottom of the tube, but less distinct than the ebullition of oxygen, because of the feeble density of liquid hydrogen. M. Cailletet said he had compressed hydrogen at 300 atmospheres. On expansion a thin fog was visible throughout the entire tube, showing liquefaction of hydrogen.

Prof. Dewar has solidified oxygen by allowing liquid oxygen to expand in a partial vacuum, when an absorption of heat takes place which produces the result sought. In its solid condition oxygen looks like snow, and has a temperature of 200° C . (360° F) below the freezing-point of water.

Prof. Henry E. Armstrong, in a paper read before the Chemical Society, after relating the results of experimental tests on the electromotive force of copper and various alloys in acids, referred to the action of metals on acids generally. He pointed out that it is probably impossible for the chemist to pronounce definitely in favor either of the modern view that the metal directly displaces the hydrogen of the acid, or of the older view that the metal displaces the hydrogen from water—the resulting oxide and the acid then interacting to form a salt; the decision of this question must apparently depend upon the determination of the nature of the phenomena during electrolysis of an acid solution. If the acid alone be the electrolyte, then doubtless the modern view is the correct one; but if both acid and water are electrolyzed, and in proportions which vary according to the conditions, then both the old and the new view of the nature of the action between a metal and the solution of an acid are correct, and the two kinds of change go on side by side.

When finely divided iron is placed in a magnetic field of considerable intensity and exposed to the action of an acid, Mr. Edward L. Nichols has observed that the chemical reaction differs in several respects from that which occurs under ordinary circumstances. He believes that the cause of the difference may be found in the fact that the solution of iron in the magnetic field is, in a sense, equivalent to its withdrawal by mechanical means to an infinite distance. Or the number of units of heat produced by the chemical reaction should differ, within and without the field, by an amount equivalent to the work necessary to withdraw the iron to a position of zero potential. Mr. Nichols's experiments upon this point having brought out other and unlooked-for modifications of the reactions, he has continued them with conditions varied as to initial temperature, the nature and strength of the acid used, and the relative amounts of iron and acid. The reaction, when iron is dissolved in *aqua regia*, varies greatly.

with the strength and temperature of the acid. At low temperatures and in weak acid, hydrogen is given off, and the solution at the end is greenish, containing ferrous chloride; at higher temperatures it is more violent, with the evolution of red nitrous fumes and a yellowish resultant solution of ferric chloride. The critical temperature between these two kinds of reaction is at about 40° C. Performing the experiment in the magnetic field, the first reaction, under conditions which would otherwise have insured the evolution of hydrogen only, was marked by an almost immediate and violent outburst of red fumes, accompanied by a correspondingly greater rise of temperature; and when the reaction was begun with the field in a neutral condition as to magnetism, the mere actuation of the magnet, at any time before the last particle of iron was dissolved, was sufficient to modify it by causing the generation of the nitrous fumes and a more rapid rise of temperature. With nitric acid a perfectly passive mixture could be brought instantly into violent, almost explosive, effervescence, with the evolution of the red fumes, by establishing a magnetic connection. With hydrochloric acid the rise of temperature was much smaller than in the determinations with *aqua regia* and nitric acid; and the speed of the reaction differed but little from that occurring under ordinary circumstances, while its character in the two cases was almost identical.

New Substances.—Cyclamose is the name given to a new sugar, which is found in the tubercles of *Cyclamen Europaeum*, and the composition of which is expressed by the formula $C_{12}H_{22}O_{11}$. The most striking feature about it is its rotatory power (-15.15), which is left-handed; while all the other sugars in the group $C_{12}H_{22}O_{11}$ are right-handed, or inactive. The activity of cyclamose is not affected by temperature, but it decreases under the influence of basic-lead acetate. Like lactose, it reduces Fehling's solution.

In October, 1878, M. Delafontaine announced, on the evidence of an absorption-band included in the spectrum of the former erbia, a new earth, philippia. In the beginning of 1880 he declared the holmium of MM. Loret and Clève identical with his philippium; but later in the same year, finding that the latter body gave no visible absorption-spectrum, and that the bands which he had at first ascribed to it really belonged to holmium, he renounced this conclusion. M. Lecoq de Boisbaudran has, however, since obtained earths exhibiting distinctly characteristic spectrum-lines, from which he has concluded that the oxide hitherto called holmia is not homogeneous, but contains *at least* two radicals. For one of these radicals he proposes to retain the name holmium, while he calls the other one dysprosium—symbol, Dy—from the Greek δυσ-πρότιτος, difficult to approach.

Prof. A. Weisbach has published a description of the new mineral argyrodite, in which

the new element germanium has been discovered. It crystallizes in the monoclinic system, with small crystals often united in rounded groups, so as not to allow of exact measurement. An analysis by Winkler gives as its composition, S 17.13, Ge 6.93, Ag 74.72, Fe 0.66, Zn 0.22 = 99.66. It occurs as a crust on marcasite and siderite, or again on argentite. The locality is the Himmelfürst mine, near Freiberg.

Arminite is another name given by Weisbach to a hydrous sulphate of copper found on porcelain-jasper from Planitz, near Zwickau, where it has been formed in the course of the burning of a bed of coal. It forms a green coating, which is resolved by the microscope into short needles or scales. Analyses give results from which is deduced as its probable formula $Cu_4CaS_2O_{11} + 6H_2O$.

Whitman Cross and L. G. Eakins describe a new mineral which occurs in cavities of a vesicular augite-andesite that is found in the conglomerate of the Green and Table mountains, Colorado. The conglomerate is chiefly composed of worn pebbles and boulders of andesitic rocks, embracing various types. Analysis determined its composition to be that represented by the formula $RO \cdot Al_2O_3 \cdot 10SiO_2 + 5H_2O$, R representing CA, K₂, and No₂. The substance belongs among the alumino-silicates, of which no previously described hydrate contains so high a percentage of silica. The name pilolite, derived from πτίλων, down, in reference to the light, downy nature of its aggregates, is proposed for this mineral.

Girdwood and Bemrose have determined the existence of a blue coloring-matter which is developed in the decay of the wood of the balsam pine (*Abies balsamina*), which is believed to be the same as the color produced in the reaction of pine-wood with phenol and strong sulphuric acid. Tiemann and Haarman have shown that this is due to coniferin, a substance which has been found in a number of other coniferae, and which, according to Kupel, exists in all of them. It has also been found in beet-root and asparagus, and is therefore far more general as a product of plant-life than is usually supposed. Samuel Rideal has found a blue coloring-matter, well developed in one specimen, in the decaying wood of the birch, and has subjected it to tests, by which it has been shown that it does not present precisely the same characteristics as that derived from Canada balsam. On carefully testing birch-wood in various stages of growth for the presence of coniferin, no traces of that substance could be found. By other tests the birch-blue was found to differ very considerably from the other natural blue coloring-matters.

Engel has produced, by the action of heat on the double carbonate of magnesium and potassium, a magnesium carbonate having exceptional properties. It is distinguished chiefly by the facility with which it is transformed into hydrate. Mixed with water, it evolves

heat, and in the course of two hours forms the hydrate containing five molecules of water if the temperature is below 16°, and three molecules if above 16°. It even attracts moisture from the air. Mixed with water to a magma, it solidifies so that the vessel may be inverted without its falling. It is much more soluble in water than the hydrated carbonates, the solution after a while depositing the hydrate in crystals, and the alkalinity of the liquid diminishing. The hydrates which it forms, however, lose easily their carbon dioxide under the influence of water and heat, like the ordinary hydrates.

Herr F. Redtenbacher, of Austria, has invented a new explosive, which is called "miline." It is a brownish-black powder, insensible to percussion and friction, and ignitable only by a spark at from 335° to 340° C. It is said to contain the elements of ordinary powder, in proportions which have been determined after about twenty years of research. It can be employed as powder is, and made to produce effects comparable with those of dynamite.

A. Kossel has found a new base in the pancreatic gland, which he obtained by the same process he had used previously for the preparation of guanin and hypoxanthine. The larger part of the base is precipitated by ammonia along with guanin, and is separated from the latter by means of its chloride. It forms crystals two centimetres long.

Joly has obtained a boride of aluminium, BoAl , in the hexagonal golden plates known as boron diamonds, by reducing boracic acid with aluminium in graphite crucibles. He has also obtained Bo_6Al in large black lamellar crystals; yellow quadratic crystals with brilliant luster, inclosing carbon and aluminium; and one or more compounds of boron and carbon, which have not yet been investigated.

Signor Rio de la Loza has described a new alkaloid, erythro-ceralloides, recently discovered in the seeds of *Erythrina coralloides*, which is remarkable as being the only poisonous principle so far obtained from a leguminous plant.

Clemens Winkler has discovered in the mineral or silver ore argyrodite (which was found by Weisbach in one of the Freiberg mines in 1880) a new metal, analogous to antimony, to which the name of germanium has been given. For its extraction, argyrodite is smelted with soda-ash and flowers of sulphur, whereby the sulphide is obtained; this is converted into the oxide by heating with strong nitric acid or driving off sulphuric acid, and the oxide is reduced by heating with hydrogen. As thus obtained, germanium is a dark-gray powder, which melts to a fluid regulus under borax glass, at about 900° C. It has a great tendency to regular crystallization, is very brittle, easily pulverized, has a distinct conchoidal fracture, and exhibits a fine metallic luster. Its specific gravity is 5·469. It is not soluble in hydrochloric acid, but readily in *aqua regia*. With

nitrates and chlorates it yields a deflagrating mixture. The atomic weights obtained for it by totally different processes are 72·32 and 72·28. The compounds of germanium certainly known are two oxides, two sulphides, two chlorides, and one iodide. Many germanium compounds are distinguished by their solubility and some by their volatility.

New Processes.—F. Lux has founded upon the results of experiments in saponification and gelatinization a method for the qualitative detection of fatty oils in mineral oils. For the detection of large quantities of fatty oil, 10 per cent. and upward, he heats a portion of the sample with a fragment of caustic soda to a boil, keeping it at that temperature for one or two minutes. If large quantities of fatty oil are present, they are recognized by the peculiar odor, and certainly by the coagulation of the liquid which ensues on slight cooling. For the detection of smaller quantities of fatty oils, down to 2 per cent., we take two beakers of moderate size, one of which can be inserted into the other so as to leave a slight interval between their bottoms. In the larger one is put so much melted paraffin that, when the narrower glass is inserted, the paraffin rises a little more than half height in the narrow annular space between the two. Into the inner glass is then poured so much paraffin that the two bodies of liquid rise approximately to the same height. In this medium a paraffin bath is obtained, in which an overheating of the liquids contained in the test-tubes, such as might occur in a single beaker, is rendered impossible, while a perfect observation of the behavior of the oil is made practicable. The thermometer should be kept at from about 200° to 210°. Two test-tubes each receive a small quantity of the oil in question. To one are added a few parings of sodium, and to the other a rod of caustic soda, which must be about a centimetre beneath the surface of the oil. The two test-tubes are then subjected to the action of the bath, and examined after having been cooled. If the mineral oil in question contains even as little as 2 per cent. of fatty oil, it will congeal on cooling in one or both tubes, to a more or less cohesive jelly.

H. B. Cornwall has given an account of his experiments with three of the commoner methods for examining butter-fats by the quantitative determination of the fatty acids obtainable by decomposition of the fat, or by allied operations—Hehner's, Reichert's, and Koettstorfer's. Hehner's process, which is described in the "Zeitschrift für Analytische Chemie," 1877, p. 145, pure and simple, was held incapable of distinguishing cocoanut-oil in mixtures, if not alone, from true butter-fat. Koettstorfer's method, "Fresenius's Zeitschrift," 1879, p. 199, which depends on the larger amount of alkali required to saponify butter-fat in comparison with a very large number of other animal and vegetable fats, has been shown by Moore to be unreliable when applied to mixtures containing

cocoanut-oil. Reichert's method, "Fresenius's Zeitschrift," 1879, p. 68, which consists in determining the acidity of the distillate of soluble fatty acids and water, obtained under constant conditions, commended itself as the only one of the three that is with any practical degree of accuracy capable of distinguishing between cocoanut-oil, in mixtures or alone, and pure butter-fat.

Dr. J. Traube has found the most important methods that have been proposed for determining the amount of fusel-oil in brandies to be defective. Such are the two colorimetric methods, and Röse's method, which is based upon the increase in volume of alcohol containing fusel. He proposes a capillarimetric method, by which so minute a proportion of fusel as $\frac{1}{10}$ per cent. may be detected. It depends upon the fact that the height to which aqueous solutions of organic bodies of one and the same series ascend in capillary tubes often decreases with the increasing molecular weight of the dissolved body. Hence, a very small per centage of fusel in brandies might be expected to betray itself by a reduction of the capillary ascent. The capillarimetric method has the advantages over that of Röse, that it admits a more speedy execution of the experiments, and that the difference in the composition of the fusels has less influence in it than in that; and it is very much more delicate.

Mr. William Crookes's method of chemical fractionation as specially applied to the "rare earths" erbia, holmia, thulia, terbia, yttria, and ytterbia, consists in fixing upon some chemical reaction in which there is the most likelihood of a difference in the behavior of the elements under treatment, and performing it in an incomplete manner, so that only a certain fraction of the total bases present is separated; the object being to get part of the material in the insoluble and the rest in the soluble state. The operation must take place slowly. Let us suppose that two earths are present, nearly identical in chemical properties, but differing by an almost imperceptible variation in basicity. Add to the very dilute solution dilute ammonia in such amount that it can only precipitate half the bases present. On filtering we have the earths divided into two parts, and we can easily imagine that now there is a slight difference in the basic value of the two portions of earth; the portion in solution being, by an almost imperceptible amount, more basic than that which the ammonia has precipitated. This minute difference is made to accumulate by a systematic process until it becomes perceptible by a chemical or physical test. When the balance of affinities seems to be established, and the earths appear in the same proportion in the precipitate and the solution, they are thrown down by ammonia, and the precipitated earths are worked up by some other process so as to alter the ratio between them, when the previous operation can be again employed.

M. H. Moissan has effected a probable isolation of fluorine, by passing a strong Bunsen pile-current through hydrofluoric acid which has been cooled to a state of tranquil ebullition at -23° . The addition of a little water or fluorhydrate of fluoride of potassium is essential to secure conductivity. Decomposition proceeds continuously, with the disengagement of hydrogen at the negative pole, and at the positive pole of a colorless gas in which crystallized silicon burns in the cold with great brilliancy, becoming fluoride of silicon. De Ville's adamantine boron burns in the same manner, but with more difficulty, becoming fluoride of boron. Arsenic and antimony combine with this gaseous body causing incandescence. Sulphur takes fire in it, and iodine combines with a pale flame, losing its color. It decomposes cold water, producing ozone and hydrofluoric acid. The metals are attacked with much less energy. Organic bodies are violently attacked. From these actions and other test-experiments, the author is satisfied that the gas described is either fluorine or a perfluoride of hydrogen.

A process has been devised at Buxton, England, for disposing of the sewage of the town by precipitating it by means of a mineral water derived from the lower coal formations of the vicinity. This water contains 1·2 grains of iron per gallon in the state of ferrous carbonate, held in solution by carbonic acid. On exposure to the air the carbonic acid escapes, and the iron, taking up more oxygen, subsides in the state of ferric hydroxide in combination with a considerable part of the organic impurities suspended and dissolved. The results were very satisfactory. They showed a large reduction in the free and albuminoïd ammonias; and they supply additional proof that mineral salts are fully capable of precipitating dissolved organic impurities.

Prof. Harvey W. Wiley has been engaged in experiments on optical methods for determining milk-sugar, particularly with reference to finding the best method of preparing the milk-sugar for the polariscope, and to making a comparison of the numbers obtained by this instrument with those given by the ordinary process of extraction. The reagents found to contribute to the best results were basic plumbic acetate, sp. gr. 1·97, in the proportion of 1cc. to 50 or 60cc. of milk; acid mercuric nitrate, 1cc.; and mercuric iodide with acetic acid.

In Steffen's patented process for extracting sugar from molasses, sirups, and the juices of plants, enough lime is mixed with an aqueous saccharine solution to form a lime-saturated saccharine solution from which a calcareous saccharate is precipitated. The percentage of lime in the finished and perfect saccharate is then reduced by mixing the hard, purified saccharate with a saccharine liquid, whereat the precipitated hydrate of lime is separated by filtering.

Edward Hart, of Lafayette College, uses, in

standardizing permanganates, a valve made by filing or blowing a hole in a glass tube open at the lower and closed at the upper end. At the beginning of the process, the valve stands outside of the flask. The liquid in the flask is rapidly heated after the iron wire is introduced, and, as soon as the wire is dissolved, is boiled to expel all air, when the tube is pushed down so that the opening is inside of the opening of the rubber cork. This prevents the air from flowing back into the flask as it cools.

Mr. H. Y. Castner, of New York city, claims to have discovered an expeditious and cheap method of preparing the alkali metals, through reduction of their hydrates or carbonates by the carbide of a metal or its equivalent. His process requires only a comparatively moderate temperature, and is represented as giving a full yield of the metal—equivalent in the case of sodium, to 90 per cent—from each charge.

G. C. Caldwell and S. W. Parr have observed that the determination of fat in milk by De Fecamp's lacto-butyrometer was liable to variations which seemed to depend upon differences in the feed of the cow. Tollens and Schmidt improved upon the method, and obtained more satisfactory results, but still left room for closer accuracy. The authors propose a method as a substitute for that given by Tollens and Schmidt. Their lacto-butyrometer differs from that originally given by Marchand only in being open at the bottom as well as at the top. Their process consists in treating the milk in the proportion of 10cc. with 8cc. of ether and 2cc. of 80 per cent. alcohol; shaking well and adding 1cc. of ordinary ammonia diluted with about its volume of water; shaking; adding 10cc. of 80 per cent. alcohol; and shaking again. The tube is then put into water at from 40° to 45° C. and kept at that temperature till the ether-fat solution separates; after which it is cooled in water at 20° C., and the reading taken from the lowest part of the surface-meniscus to the line of separation between the ether-fat solution and the liquid below it. This method is found "capable of a degree of accuracy that leaves nothing to be desired."

Industrial Chemistry.—In one of his last addresses to the French Academy, M. Dumas called attention to the numerous benefits pertaining to the chemical industries which have taken their departure from the Leblanc process for the extraction of soda from sea-salt. First, the working of the process placed at the disposal of the soap-makers, the glass-manufacturers, the bleachers, and the paper-makers, all the alkali they needed, and gave to all industries unlimited quantities of sulphuric and hydrochloric acids at extremely low prices. The second result was the introduction of chloride of lime for the bleaching of vegetable tissues. Next arose the question whether it was wise to depend upon the sulphur of Sicily, which might at any time be enormously advanced in price; and iron pyrites, previously worthless,

was utilized for the manufacture of sulphuric acid. The price of soda becoming reduced by competition, a new source of profit was found in the manufacture and sale of chloride of lime. A residue of sulphate of lime was formed, which was likely to prove a great nuisance, when the danger was removed by the invention of a process for regenerating the soda which was left from the leachings. The rare and valuable peroxide of manganese was consumed in the manufacture of chlorine and chloride of lime, and the useless chloride of manganese was formed in its place. This waste was remedied by the invention of a process for getting rid of the chloride. The price of soda continuing to fall, the next remedy was sought in treating new ores which would furnish other remunerative merchantable products. For iron pyrites was substituted copper pyrites, in which precious metals are often accompaniments, and from which profit might be derived through the silver or gold that could be extracted from their cinders.

Mr. A. McDonald Graham prepares a composition for precipitating sewage by heating a mixture of iron pyrites and binoxide of manganese in close contact with air, whereby a sulphate of manganese and iron is obtained. In operating on the sewage, the sulphates of iron and manganese may be used with a certain proportion of clay. Charcoal may also be associated with it if the sewage is much discolored, and lime if it is acid; but generally the sewage will be found sufficiently alkaline. In order to convert the sewage-mud into a useful precipitant, it must first be dried. Formerly the drying process was attended with much difficulty and expense; but as the nature of the product to be treated has become better understood, the drying difficulty has been to a great extent surmounted. It is found by experience that after such a precipitating medium as alumina, iron, or manganese has passed through the sewage, it acquires the property of spontaneous heating when mixed with organic matter. If, therefore, the mud obtained by the use of such precipitants on the sewage be deprived of superfluous water by means of a filter-press and placed in heaps in a sheltered situation, a natural heating takes place, after which the mud becomes dry and friable and can be readily brought into a fine state of division. It should then be furnace with sufficient iron pyrites to reconver the iron and manganese into sulphates.

Richard Meyer makes use of the microscope in the examination of printed cotton goods to ascertain whether the dye as such has been produced inside of the fiber, or whether it has been employed already formed and fixed by means of albumen. If the fabric is macerated, using a needle so that the single fibers can be isolated, these will appear equally colored throughout their entire mass if they have been colored by a dissolved dye. The characteristic form of the fiber remains unaltered, and it can

be plainly seen that the coloring-matter is deposited equally in its interior. When the albumen method has been used, the fiber appears entirely without color. At various points dyed bits of coagulated albumen will appear gummed to the fabric, and some of these particles will be found isolated in consequence of the maceration.

H. L. Greville separates carbon disulphide as a residual product from coal-gas, which he finds to exist in the proportion of from thirty to forty-eight grains in the hundred feet of crude gas. It is removed by using gas-purifiers containing lime through which gas has been passed containing H_2S , but no CO_2 . When saturated the lime has a bright orange-red color. By distilling this lime with water, CS_2 is obtained, amounting to between 1 and 2 per cent, on the amount of substance taken. Picked specimens yielded from 3 to 4 per cent.

Analytic Chemistry.—Willis G. Tucker, in a paper read before the Albany Institute, has made a critical estimate of the value of the principal methods for the chemical analysis of water, and has exposed the present condition of science and practice on the subject. The methods at present in use, each of which has its advocates, are, the permanganate process, which employs permanganate of potash to determine the amount of oxidizable matter in the water; Wauklyn and Chapman's albuminoid-ammonia process, which aims to estimate the amount of putrescible nitrogenous matter; and Frankland and Armstrong's combustion process, by which the relative proportions of nitrogen and carbon in the impurities are determined. No one of them enables us to recognize the real morbific material which water may contain, or is able to distinguish with certainty between disease-producing constituents and the less harmful and innocent matter of organic origin. Some advantage may be gained, but it is not decisive, by using two or all of them together. All attempts to establish definite standards, so that the points for and against a water can be counted up, and a balance struck, have failed. With the means at present at our command, waters which are very pure, chemically, of medium purity, and foul, may be distinguished, but whether these waters are therefore safe to use, doubtful or harmful, must be a matter of opinion, and is not to be decided by the analytical results. Dr. Buchanan, of the Local Government Board of Great Britain, says, on this point, that while we must ever be on the watch for indications that chemistry affords of contaminating matters gaining access to our waters, we must go beyond the laboratory for evidence of any drinking-water being free from dangerous organic pollution. The chemist can, indeed, tell us of impurity and hazard, but not of purity and safety. Chemical analysis may reveal to us the presence of compounds which have doubtless resulted from the decomposition of animal matter; and, while there may be no certainty of its producing spe-

cific disease, we shall err on the safe side if we refuse to use the water. And an analysis may assure us that a given water is of such a degree of purity that the probabilities are that it carries with it no harmful matter; but this kind of evidence is always to be received with caution, unless the results of the examination are borne out by other evidence proving that pollution is not probable. While it can not tell us that a water is absolutely safe or necessarily harmful, it can tell us that it contains those constituents which may reasonably be believed to accompany harmful matter. Prof. Mallet confirms this view in the report of the National Board of Health for 1882, where he holds that it is not possible to decide absolutely upon the wholesomeness or unwholesomeness of a drinking-water by the mere use of any of the processes for estimating organic matter or its constituents; that such processes must be used in conjunction with the investigation of other evidence of a more general sort as to the source and history of the water, and should then be deemed of secondary importance; that there are no sound grounds on which to establish such general standards of purity as have been proposed, looking to exact amounts of organic carbon or nitrogen, albuminoid ammonia, oxygen of permanganate consumed, etc., and that two entirely legitimate directions are open for the chemical examination of the organic constituents of drinking-water—the detection of very gross pollution, and the periodical examination of water-supplies—in order that the normal or usual character of the water having been previously ascertained, suspicious changes which may occur shall be detected and investigated.

Dr. Curtis C. Howard, of Stirling Medical College, Columbus, Ohio, recognizing the desirability of finding tests for impurities in water available for physicians' use, suggests that they should fulfill the conditions of requiring no apparatus and but one or two reagents, and of giving results which, manifested either by the appearance of a color or a precipitate, are at once recognized by the eye. The most considerable impurities in water are attended by the presence of nitrites and chlorides. For nitrites the most delicate reagents, and the most satisfactory, for Dr. Howard's purpose, are sulphuric acid and naphthylamine hydrochloride. If water containing not more than one-thousandth part per hundred thousand of nitrous acid be treated with a drop of hydrochloric acid and a drop each of solutions of these reagents, after standing fifteen or twenty minutes, only the faintest tint of pink will be perceived. If a marked pink be produced, the quantity of nitrites is sufficient to indicate serious contamination. In sewage and in the water from a few wells, the color was a deep carmine, and the quantity present was from twenty to sixty-six times the limit stated. The reagents for chlorides are nitric acid and silver nitrate, which produce in water

containing chlorides a white precipitate of silver chloride.

The detection of adulterations in oils is often a difficult and trying task; and the percentage of the oil used to adulterate can seldom be determined. We must often be satisfied by proving that there has been a mixture, without knowing the nature of it. Prof. Bechi, of Florence, recommends for detecting cotton-seed oil in olive-oil, a 1-per-cent. solution of nitrate of silver in absolute alcohol. When heated with the oil in a water-bath at 84° C., the mixture will begin to darken if there be any cotton-seed oil present.

Mr. Oscar S. Carter recommends the elaidin test in detecting a mixture of a drying and non-drying oil, and in detecting adulterations of olive-oil. It depends upon the fact that olein and oleic acid, in contact with peroxide of nitrogen, yield a crystalline, solid, fatty body, at 32° C., to which the name *elaidin* has been given. Non-drying oils, and most animal fats, contain oleic acid. Olive, almond, rape, arachis, and castor oils, and the oils made from lard and tallow, contain a high percentage of olein. These oils form, with nitrogen peroxide, solid elaidin of a white or yellow color. The drying oils—such as linseed, hemp-seed, and poppy-seed oils—do not form elaidin, but remain liquid for some time, and become slightly colored. A test for lard-oil is its complete saponification with caustic soda. Shark-liver oil and African fish-oil resist saponification. Pure lard-oil gives, with nitric acid, a yellow color, approaching orange. Adulterated oils, with nitric acid of the same strength, gave a distinct brown color on standing; and the part that resisted saponification gave a much darker, a deep-brown, color. The determination of the specific gravity is the most important of the physical tests of oils. Viscosity is an important feature, but the testing by it requires much care. While we can not depend on any single test, the evidence afforded by several tests is often conclusive and satisfactory.

Mr. Thomas W. Drown, while employing a process for the determination of metallic sulphides, with especial reference to the estimation of pyrites in coal, by treatment with sodium-hydrate solution saturated with bromine, found that the results secured, though agreeing well together, fell far short of accounting for all the sulphur in the coal. He thence inferred that the sulphur not oxidized by the treatment with the bromine solution was an organic constituent of the coal, and could only be determined by a process which would oxidize the coal completely. In the investigation of the question that arose, he performed analyses to determine the effect of coking on the amount and condition of sulphur in coal, using coke prepared in the laboratory and coke baked in ordinary ovens in two distinct series of experiments. The results of the analyses, while they were not regarded as complete, indicated the presence of sulphur both as pyrites and as an

organic constituent of the coal, and also of iron in the two conditions of combination with the sulphur and with silica or other inorganic constituents of the ash.

Mr. Thomas M. Morgan, in several attempts to determine the nitrogen in organic nitro-derivatives by heating the substance in sealed tubes of hard glass containing oxygen, in the presence of a little mercury, found that in all cases the nitrogen obtained was considerably less than the quantity theoretically present in the substance analyzed. The source of this deficiency was eventually traced to the action which the oxides of nitrogen exerted on the alkali of the glass and on the mercury; and the reality and extent of this action were confirmed by a number of significant experiments. The action is much more energetic at a high than at a low temperature, and appears to be very slight till the heat approaches redness.

Brügelmann has described a number of experiments in crystallization which support the law of Berthollet, that when two salts are dissolved, the solution contains four salts produced by their mutual reaction. Equal volumes of cold saturated solutions of cobalt chloride and nickel sulphate gave crystals containing both metals, but combined with sulphuric acid only. Solutions of copper sulphate and cobalt chloride, mixed together, deposit wine-red crystals, consisting principally of sulphates of both metals, but containing admixed chlorides. A copper sulphate solution and one of potassium dichromate, when mixed, deposit, first, bright-green crystals containing both metals, principally as sulphates—these crystals, in various intermediate stages, yellow-green, green, and blue-green, and finally a dark-brown deliquescent mass, becoming crystalline over sulphuric acid, consisting essentially of both metals combined with chromic acid.

By a recent modification of Dumas's process for the estimation of nitrogen in coal and in nitrogenous compounds that yield tarry matter on destructive distillation, the gas evolved is collected in two portions: that which escapes during the distillation in CO₂; and that which is collected while the residual nitrogenous carbon is undergoing combustion in oxygen. By this method some insight is given as to the condition of the nitrogen in the compound. The authors have found that different nitrogenous compounds vary greatly as to the proportion of their nitrogen which escapes during destructive distillation, and also that the ratio between the two portions of nitrogen is simple and constant in each compound.

Chemical Synthesis.—P. W. Latham reports a successful synthesis of uric acid in the manner indicated by Horbaczewski. He exposes glycocine and urea in the proportion of one to ten to a temperature of from 210° to 212°; dissolves the resultant mixture in warm water assisted by solution of potash; and treats with ammonium chloride and ammonia, ammonium-nitrate of silver, ammonio-sulphate of magnesia,

and ammonia; then treats with solution of potash, sulphureted hydrogen, and hydrochloric acid. After boiling and cooling, uric acid, mixed more or less with cyanuric acid, and a little coloring-matter, are deposited. The uric acid is separated from the cyanuric acid by further treatment with the ammoniacal solution of silver and magnesia. Although the yield is small, the crystals of uric acid are well marked, answer to all the required microscopic tests, and respond perfectly to the murexide test.

Ladenburg has prepared piperidine, with nearly the quantitative yield, by treating pyridine with sodium in alcoholic solution, and has also obtained some interesting homologues of that base.

The general impression seems to prevail that the synthetical production of the vegetable alkaloids will soon be accomplished. While it is very probable that every compound produced in the vegetable organism may ultimately be obtained artificially, a knowledge of the constitution of these compounds must first be acquired. The most important result of recent investigations in this field is the demonstration that many of the alkaloids are definitely, others very probably, to be considered derivatives of quinoline and pyridine. Thus, in the case of quinic acid, which differs from quinoline by the substitution of two radicals for two hydrogen-atoms, as the structural formula of quinoline admits of 42 possible acids of the composition of quinic acid, it has to be determined which of the 42 isomers quinic acid really is, and this has been done with a certain, but not full, measure of success. Morphine is probably a derivative of pyridine, and stands, at the same time, in close structural relation to the hydrocarbon phenanthrene; but there is still a great gap between the knowledge of these isolated facts and the artificial production of this alkaloid. Atropine, the active principle of belladonna, has been reconstructed synthetically from its decomposition products, tropic acid and tropine. Tropic acid, also, has been artificially prepared, but we are still ignorant of the constitution of tropine. Hence, we have as yet no method of producing atropine independently of the plant from which it is now obtained. But granting that the structural composition of the alkaloids was clearly established, their production on a technical scale would still probably be impracticable, for it is likely that the materials necessary for their artificial manufacture would be too costly and the processes too complex for available use. Mr. Cresswell Hewett has, however, announced that he has discovered a process for the synthetical manufacture of quinine from an article that exists in abundance everywhere, whereby the price of that drug may be greatly reduced.

W. H. Green obtains saligenin synthetically by heating determined quantities of methylin chloride, phenol, and sodium hydrate dissolved in water, for six hours. The contents of the

matress are neutralized with hydrochloric acid, and the saligenin is extracted with ether.

Atomic Weights.—Brauner has estimated the atomic weight of cerium from the ceric oxide left after ignition of anhydrous cerous sulphate. Twenty-three determinations gave a maximum atomic weight of 140,433, a minimum of 140,033, and a mean value of 140,210; thus harmonizing the periodic values of the group. H. Robinson has criticized the work of Wolf, on which the atomic weight (138) given for cerium in Clark's "Constants of Nature" is based, maintaining that Wolf's method of preparation would give lanthanum and not ceric oxide.

Prof. Cl. Winkler has provisionally fixed the atomic weight of germanium at 72·75, and has assigned it a rank between silicon and tin, as the "eka-silicon" of Mendeleeff's classification. M. Lecoq de Boisbaudran had calculated the atomic weight of the hypothetical body between silicon and tin to be 72·28, taking Si = 28 and Sn = 118. A spectroscopic examination of a specimen of the metal received from Prof. Winkler gave 72·32; repeated with a modification for the avoidance of a probable uncertainty, it gave 72·27.

John Waddell, conceiving that previous determinations of the atomic weight of tungsten might have been vitiated by the presence of molybdenum and silica, undertook a new determination with samples from which those impurities had been carefully removed, employing, with his processes, a new method of purification, by fractional precipitation. The result of his experiments was the deduction of 184·5 as the atomic weight of tungsten, that of oxygen being taken as 16. This is confirmatory of previous investigations of the subject, and of the accuracy of the commonly accepted atomic weight of the element in question.

Chemistry of Plants.—V. Meyer and E. Schulze have made researches on the action of hydroxylamine salts upon plants, with the expectation of finding that this plays an important part in the synthetical activity of vegetation. They instituted parallel experiments on the culture of maize, to which nitrogen was supplied in the form of ammonium sulphate, hydroxylamine sulphate, and hydrochlorate and potassium nitrate. The result was to show that the hydroxylamine salts act as direct poisons to plant-life, as Bertoni has shown they do toward animal life. Having established this fact, the authors inferred the probable action of the salts as antiseptics, and experiment showed that they partake this property in a remarkable degree.

M. E. Maumené has found manganese in wines and in a considerable number of vegetable and animal products in which it had hardly been supposed to be present; and now announces, as the result of his latest investigations, that he has detected it in a great many plants. Wheat contains not less than from $\frac{1}{1500}$ to $\frac{1}{700}$ of metallic manganese, and rye,

barley, rice, and buckwheat have also yielded considerable quantities of it. A little of it may be found in the potato, and more in the beet, the carrot, beans, peas, asparagus (principally in the green part), sorrel, wild chicory, lettuce, parsley, and in many fruits. It occurs in large proportions in cacao and the coffees, and in tea there are five grains of the metal to one kilogramme of the leaves. Tobacco is quite rich in it, as are also a variety of other plants, including some forage and some medicinal plants.

Prof. F. H. Storer, of the Bussey Institution, has made analyses of the leaves of the yellow or curled dock (*Rumex crispus*), and of the sprouts of the common milk-weed (*Asclepias cornuta*), plants which are sometimes cooked and eaten as greens, for the purpose of ascertaining their food-value. The dock-leaves were taken when the tufts had attained a length of about a foot and a half, and before any flower-stocks had begun to appear. Of the milk-weed, sprouts and shoots from four to twelve inches long were cut off just below the surface of the ground at about the same time, or in the latter part of May. Analyses were made of specimens of either kind dried, both in the air and at 110° C. The analyses of the dock gave the ratio of albuminoids to carbohydrates as 1:2; those of the milk-weed as 1:1.6. Thus both plants are shown to be highly nitrogenous when young, and to compare favorably in composition with other weeds used as food, the analyses of which have given good results.

From analyses of ninety-two specimens of wheat and straw ashes, the whole history of each of which was known, Messrs. Lawes and Gilbert conclude that there is, on the whole, great uniformity in the mineral composition of the grain, under different conditions of manuring, provided only it is perfectly and normally ripened. The influence of season produces a much wider range in the mineral constituents of the grain than the manuring. This, however, is not the case with the straw, as it appeared that the amount of mineral and ash constituents found in it have a direct connection with the amount available in the soil.

Experiments made by Prof. Gilbert and Dr. W. J. Russell show the existence of a close connection between the formation of chlorophyl and the amount of nitrogen assimilated by plants. The amount of carbon assimilated is not, however, in proportion to the chlorophyl formed, unless a sufficiency of mineral substances required by the plants is available. In cases where nitrogenous and mineral manures were applied, a lower proportion of nitrogen assimilated, and chlorophyl formed over a given area was observed; and this is no doubt due to the greater assimilation of carbon and consequent greater formation of non-nitrogenous substances. But the amount of nitrogen assimilated and chlorophyl formed were as great, if not greater, in the latter case than in the former.

Berthelot and André, of Meudon, France, have conducted a series of investigations on the existence of nitrates in plants, the results of which they have published in four memoirs. They found that, of the plants they examined, *Borrage officinalis* and the *Amarantaceæ* contained most nitrates; that those salts are most abundant in the stems, and next in the roots; that they increase from germination till just before flowering, and then diminish, but increase again after the reproductive function is completed, and even after the death of the plant. Four sources are suggested as possible origins of nitrate: the fertilizers used; the soil; the nitric acid of the atmosphere; and formation in the plant itself. Analysis of the soil showed that the earth over a hectare, to the depth of 0.325 of a metre, contained less than half the quantity of nitrate contained in the *Borrage* grown on its surface, and less than one sixth of that in the gigantic amaranth. Direct experiment also showed that the nitrates in the soil did not perceptibly increase during the growth of nitrates in the plant; and that even when they were washed out of the soil by the rain the quantity in the plant remained sensibly the same. As to the atmosphere, analyses at the Montsouris Observatory showed that the nitrate in the rain which fell during the season amounted upon a hectare to 4.4 kilograms only, or hardly one twentieth of the quantity in the soil. The authors therefore conclude that the formation of nitrates in plants is an established fact, and seems to result from the special action of a more general function of the cellules, the function which gives rise to oxidations; that is to say, the same function which produces carbonic acid and carbonates, oxalic, tartaric, citric, malic, and other peroxygenized acids.

Prof. J. H. Gilbert records, as the result of comparable experiments at Rothamsted with the same crop, that depth of green color by no means implies a finally greater amount of carbon assimilation; while it had previously been experimentally proved there that the deeper color was associated with relatively higher percentage of nitrogen in the dry or solid substance of the herbage; and this obviously means a lower relation of carbon to nitrogen. Further experiments were instituted in co-operation with Dr. W. J. Russell, who undertook to make comparative determinations of the amounts of chlorophyl in parallel specimens, while Prof. Gilbert and his associates were to determine the percentages of dry matter and nitrogen. The facts were brought out in these experiments that the separated leguminous herbage of hay contains a much higher percentage of nitrogen in its dried substance than the separated gramineous herbage; and that, with the much higher percentage of nitrogen in the leguminous herbage, there was also a much higher proportion of chlorophyl. Under comparable conditions, the *leguminosæ* eventually maintain a much higher relation of

nitrogen to carbon than the *gramineæ*; in other words, in their case carbon is not assimilated in so large a proportion to the nitrogen taken up. Wheat-plants, manured with ammonium salts alone, show a much higher percentage of nitrogen than those manured with the same amount of ammonium salts with mineral in addition. The result was exactly similar in the case of barley. It is evident that the chlorophyl formation has a close connection with the amount of nitrogen assimilated, but that the carbon assimilation is not in proportion to the chlorophyl formed, if there be a relative deficiency of the necessary mineral constituents available. No doubt there had been as much, or more, of both nitrogen assimilated and chlorophyl formed over a given area, where the mineral as well as the nitrogenous manure had been applied; but the lower proportion of these substances in the dry matter was due to the greater assimilation of carbon, and consequent greater formation of non-nitrogenous substances. These results of experiments in the field are perfectly consistent with those obtained by vegetable physiologists in the laboratory, who have found that the presence of certain mineral or ash constituents, and especially of potassium, is essential to the assimilation of carbon.

From experiments reported by MM. Déhé-rain and Maquenne, on the absorption of carbonic acid by leaves, it appears that the proportion of pure carbonic acid absorbed under atmospheric pressure varies with the quantity of water contained in the leaves.

The results of Aimé Girard's investigations of the alimentary value of the several tissues of which the wheat-grain is composed go to show that while a considerable proportion of the seed-coats is digestible by man, the proportion thus utilized, when calculated upon the whole grain, is very small, and the quality of the bread is impaired by the presence of those substances. This is particularly the case with raised bread. According to Mége-Mouriès, the envelope contains a soluble ferment resembling diastase, which, during the raising process, in addition converts starch into sugar and diminishes the elasticity of the gluten, thereby tending to make the bread heavy, while it also imparts a brown color to it. Bread made with baking-powder would naturally escape these effects to a large extent. It is certain that wholesome, palatable bread, which many persons may prefer for dietetic reasons, may be made from whole wheat-flour. But, from an economical point of view, such flour can hardly claim any great advantages, so long as nearly every one can command a mixed diet, and the bran can be profitably utilized as cattle-food.

Miscellaneous.—All compounds of arsenic are known to be toxic except the so-called arsenic-methyl bodies, or cacodyl compounds. Concerning these the testimony has been conflicting. The principal experiments on the

subject have been made with cacodylic acid (CH_3AsO_2). As OOH, a compound which contains 34·35 per cent. of metallic arsenic, equivalent to 71·4 per cent. of arsenious oxide. Bunsen and Kürschner found it not poisonous. Schmidt and Chomse reached a similar conclusion. Lebahn experimented on rabbits, all of which died, and concluded that cacodylic acid does possess poisonous properties, and that its toxic symptoms are like those of ordinary arsenical poisoning. John Marshall and Walter D. Green, of the University of Pennsylvania, made a series of experiments upon dogs in the fall of 1885 with what they had ascertained by severe tests to be perfectly pure cacodylic acid. The most marked effects and symptoms following the administration of the drug were: nervous symptoms, with vomiting, purging, and slowing of respiration, due to spinal irritation and slight paralysis; decided weakness in the hind extremities; and a peculiar condition of somnolence resembling hemiplegia. The symptoms as a whole were nearly analogous with those produced by arsenious oxide, but the results were not fatal. The experimenters reached the conclusion that cacodylic acid is not a poisonous substance in the general acceptance of the word poison.

In illustration of the volatility of mercury, Berthelot remarks that, in his laboratory is a mercurial trough, and some eight feet from it a glass case containing a bottle of iodine. After some years, he noticed that the neck of this bottle above its junction with the stopper was covered with red mercuric iodide.

W. Engling has found that ammonium oxalate when added to milk does not precipitate its calcium salts; but that if, after the addition of the oxalate, calcium chloride be added, the casein is separated and carries calcium oxalate along with it. He infers from these facts that the calcium of milk "is in definite organic combination with the casein, and this combination must first be destroyed before calcium can be separated as oxalate. The calcium albuminates in milk resemble basic salts, and are readily decomposable by acetic, lactic, and tartaric acids." W. Mattieu Williams suggests that this view of the chemical condition of the calcium of milk has considerable physiological and practical interest, in the light it may throw upon the manner in which the bone-material of infants and the young of animals is separated from the milk upon which they are fed. Combinations of bases with mineral acids are rarely if ever broken up in the animal body for assimilation, and it is at least doubtful whether such compounds are appropriated in their combined state for organic construction and renewal. "But a loose compound of calcium with casein is just the sort of material which can be, and is, subjected to chemico-vital metamorphosis. If it can be shown that the phosphoric acid of the milk is also combined with an easily dissociable organic base or bases, we have the condi-

tions especially suited for their separation and plastic reunion in the body."

Prof. Clowes, examining some of the sandstones of the New Red beds near Nottingham, discovered the presence of barium sulphate in varying proportions, while some of the lower beds also contained calcium carbonate. In some of the beds the barium sulphate was very unequally distributed, and formed a network or a series of small masses more or less spherical in shape. In such sandstone the sand-grains between the sulphate streaks and patches were quite loose, and the surfaces that were weathered presented a honeycombed appearance. To explain the presence of the barium sulphate, Prof. Clowes suggests that it might have been deposited along with the sand; but if such had been the case it had certainly undergone a physical change, as it now existed in a firm, compact, and crystalline condition. It would, therefore, appear that it had been either deposited from aqueous solution or that it had been rendered crystalline by a slow percolation of the solvent liquid through the sedimentary deposit, or owed its origin to the action of water containing calcium sulphate passing through sandstone cemented originally with barium carbonate.

The views concerning the transformation of starch into sugar by boiling with sulphuric acid, or the action of diastase, have been so contradictory that the nature of the changes which starch undergoes has remained open to question. Musculus was of the opinion that starch was split up into two molecules of dextrin and one molecule of sugar, and that later the acid acted on the dextrin thus formed, though very slowly. Payen asserted that starch did not split up in the manner thus supposed, under the influence either of diastase or of sulphuric acid, but that a gradual transformation took place. F. Salomon, who, by the adoption of improved methods has succeeded in placing the reaction on a satisfactory basis, first studied its beginning and end products—starch and glucose—and then the intermediate products—"soluble starch" dextrin, and maltose—particularly with regard to the analytical processes involved in their determination. Allihn has shown that starch is never entirely converted into sugar by the ordinary process of action with dilute sulphuric acid and the reducing solution of copper, 95 per cent. being the maximum that can be obtained by it. But if hydrochloric acid is used according to the method of Sachsse, a complete conversion may be effected. When pure sugar solutions are used, the hydrochloric or Allihn process is exact; but if the solutions contain other substances, good results can be obtained only when special care is taken. Salomon studied the action of dilute sulphuric acid in an apparatus in which a certain amount of starch solution could be boiled at a fixed concentration, and from which portions could be easily taken for analysis at regular intervals.

These portions were examined as to their action on iodine solution, their rotatory power and specific gravity. By the study of sixteen observations, in some of which the boiling processes were continued for twenty-eight hours, it was seen that the change from one color to another is very gradual; that it always takes place in the same order, viz., from deep-blue to violet, red-violet, red, red-brown, brown-yellow, yellow, and finally colorless; and that neither the complete extinction of the color nor the individual shades correspond exactly with the amount of sugar formed as shown by the rotatory power.

Prof. H. Carrington Bolton has obtained some very interesting results regarding the action of citric acid, which is hardly less powerful than that of hydrochloric acid on minerals. His later researches bear particularly on the effects of prolonged action at ordinary temperature. Of the sulphides, chalcocite showed signs of decomposition at the end of ten days, and gave, after several months, a partial solution of a green color. Pyrite was slightly attacked in eight days, and a month later gave a reddish-yellow solution. Chalcopyrite acted in a similar manner, and lost 11 per cent. after fourteen months. Of the oxides, magnetite and limonite were strongly attacked in eight days, while haematite yielded more slowly, but showed decided decomposition after several months. Of the silicates, datolite was most quickly decomposed, yielding gelatinous silica after twenty-four hours. Hornblende, pyroxene, almandite, epidote, vesuvianite, and serpentine were decidedly decomposed in eight days, while after fourteen months hornblende and pyroxene were completely decomposed, and serpentine yielded a dry, gelatinous mass. The feldspars were unevenly attacked under like condition. Tourmaline and staurolite yielded after four or five months, while talc and cyanite seemed to resist attacks. Muscovite and biotite yielded very slowly. Prof. Bolton has prepared a table showing, after these results, the relative disintegration of minerals by citric acid in solution, in which the minerals are classified as those quickly decomposed, those slowly decomposed, those very slowly decomposed, and those not decomposed. To the last class belong quartz, corundum, spinel, beryl, fluorite, and barite.

J. R. Duggan has made experiments for the determination of diastatic action. The principal conditions affecting the converting power of substances containing diastase are time, temperature, and the presence of various foreign substances, such as acids, alkalies, etc. Previous experiments have shown that the action of the ferment is very much retarded by the presence of quite small amounts of alkali. When greater quantities of alkali are used, there is little or no conversion. The author's experiments on the influence of acids have led him to doubt the general statement

that diastase acts best in a slightly acid medium; or, if this is true, the amount of acid required is more minute than is usually stated.

CHILI, an independent republic of South America. (For details relating to area, population, etc., see "Annual Cyclopædia" for 1883 and 1884.)

Government.—The President is Don Manuel Balmaceda, whose term of office will expire on Sept. 18, 1891. The Cabinet was composed in 1886 of the following ministers: Interior, Señor J. I. Vergara; Foreign Affairs and Colonization, Don Francisco Freire; Justice, Public Worship, and Instruction, Señor E. C. Varas; Finance, Señor Edwards; War and Navy, Señor C. Atúnez. The Chilian Minister to the United States is Señor Ambrosio Montt. The Chilian Consul at New York is Don B. R. de Espriella; and the Consul-General at San Francisco, Don J. de la Cruz Cerdá. The United States Minister to Chili is Hon. William R. Roberts. The United States Consuls in Chili are: D. M. Dunn, at Valparaiso; J. Grierson, at Coquimbo; and J. F. Van Ingen, at Talcahuano.

Political Reforms.—Important reforms are being attempted in Chili. One project provides that no senator or deputy shall be interested in any public contract; another is, that neither the President, nor any minister, shall give an office to a near relative unless it be proved that he is qualified in every respect to hold it. Another project being agitated is, that the President of the Republic shall in future be elected by the Congress instead of by popular suffrage. The agitation of this matter is due to the terrible bloodshed in the last elections, when upward of forty persons were killed and a large number wounded.

Army.—The strength of the army—in conformity with decrees of Dec. 26, 1884, and Jan. 9, 1885—was 7,100 men, commanded by 970 officers, the number of rank and file only to be kept up for eighteen months, when it was to be reduced to 5,541 men. The National Guard, in conformity with the law of Sept. 26, 1882, is subject to mobilization whenever required.

Navy.—At the close of 1885 the Chilian navy consisted of the following steamers: two iron-clads, one monitor, three corvettes, two gun-boats, three cruisers, two transports, four *escampavias*, six pontoons, and nine torpedo-boats. The law of Jan. 9, 1885, left in active service only two iron-clads, one monitor, three corvettes, three gunboats, three cruisers, two *escampavias*, five pontoons, and 800 sailors and marines to serve as a garrison of the fleet and colony of Magallanes. The navy was manned by 1,399 sailors. The Government has ordered another man-of-war, according to the designs of Sir E. J. Reed. It is to be an armored cruiser of 4,500 tons, with a speed of 19 knots an hour. The armament will consist of two 25-ton 10-inch guns; one 14-ton 8-inch gun; two 6-inch; four 6-pounders; eight mitrailleuses; and eight tubes for firing Whitehead torpedoes. The cost of the vessel, according to the

designs approved by the late Admiral Lynch and Capt. J. J. Latorre, is from \$1,200,000 to \$1,500,000.

Postal Service.—The number of post-offices in operation early in 1885 was 411; letters dispatched, 13,438,439; registered, 98,899; sample packages, 28,668; law notifications, 15,598; Government dispatches, 669,160; newspapers, 15,615,069; aggregate number of items of mail matter, 29,865,833, against 24,231,967 the previous year. The receipts were \$388,425, an increase of \$41,647 as compared with those of the year preceding; and the expenses amounted to \$326,980, being less than those of the previous year. Postal orders were issued to the amount of \$1,448,608.

Railroads.—There were in operation on Jan. 1, 1885, the following-named lines of railway:

GOVERNMENT.	Length in kilometres.
LINES.	
Santiago to Valparaiso.....	186
Santa Rosa branch.....	45
Santiago to Palmilla.....	304
Maule to Taleagueano.....	418
Total.....	948

PRIVATE.	Length in kilometres.
Arica to Tacna.....	63
Pisagua to Tres Marias.....	106
Iquique to Tres Marias.....	194
Patillos to Salitreras del Sur.....	93
Mejillones to Cerro Gordo.....	29
Antofagasta to Salinas del Dorado.....	123
Talita to Refresco.....	82
Chanaral to Salado.....	60
Calero to Copiapo.....	242
Carizal Bajo to Carrizal Alto.....	36
Coquimbo to Serena.....	15
Coquimbo to Ovalle.....	123
Serena to Vicuña.....	60
Tongoy to Tamaya.....	55
Laraque to Maquegua.....	40
Total.....	1,826

Those planned and partially in course of construction, by the Government and by private companies, are the following lines:

LINES.	Length in kilometres.
Quilpué to Melipilla.....	150
Calera to Ovalle de Norte.....	250
Pelequen to Peumo.....	50
Talca to Constitución.....	85
Parral to Cauquenes.....	55
Coihue to Mulchen.....	25
Renao to Osorno.....	300
Angol to Traiguén.....	74
Concepcion to Cañete.....	160
Total.....	1,149

Congress also gave authority to private companies to undertake the following extensions of lines now in operation: To prolong the Anito-fagasta line to the Bolivian frontier, and in another direction to the Aguas Blancas nitrate-fields; to construct a line between the port of Guasco and the city of Vallenar; from Santiago to the Las Condes silver-mines, east of the capital; Chagres to Santa Rosa de los Andes; Nilhue to Catemo; Concepcion to Lota; and Lota to Colicó de Sur.

Work on the Chilian section of the Transandine Railway was begun in July, and as the section between Buenos Ayres and San Juan was finished on May 8, Chili and the Ar-

gentine Republic hope to be connected in the summer of 1888. Besides the 2,274 kilometres in operation in 1886, there are short railways to coal-mines, as, for example, to Coronel, 5 kilometres; to Lota, 3; between Lebu and Punta Arenas de Magallanes, and a tramway of 8 kilometres from Port San Antonio to Boca de Maipu.

The total cost of Government railroads in Chili, on Dec 31, 1884, was \$42,107,934, and the movement on them had been as follows:

ITEMS.	1883.	1884.
Gross earnings	\$5,561,890	\$6,000,053
Expenses	3,008,317	3,141,295
Net earnings	2,553,373	2,858,758
Passengers conveyed	2,947,087	2,515,077
Merchandise forwarded (metrical cmts.)	9,959,184	10,693,735

In Santiago there are in operation 56 kilometres of horse-railroads, and in Valparaiso 10. There are also tramways in Concepcion, Chilian, Limache, Rengo, Quillota, and Talca.

Highways.—The Government is keeping in good condition upward of 700 public highways, of a total length of 50,000 kilometres; and the municipalities and private parties keep in repair 1,600 highways, with an extent of 40,000 kilometres.

Inland Navigation.—Seventy-eight navigable water-courses traverse the interior, the aggregate distance being 4,500 kilometres.

Telegraphs.—The Government has under its charge the telegraph system of the republic, there being in operation, in 1885, 126 offices; the length of wire was 10,320 kilometres, and the cost had been \$688,189. There were sent 411,784 private messages, against 393,781 the previous year, and 110,390 Government messages, against 84,841; the receipts being \$198,-609, against \$173,417. The public may also avail themselves of a private line between Santiago and Valparaiso, and of another between Santa Rosa de los Andes and the Argentine Republic. Finally, there is the cable along the Chilian coast, in communication northward with the world's cable system.

Finances.—The report of the Chilian Minister of Finance, made on June 1, 1886, showed that the ordinary and casual income in 1884 had been \$39,910,133, being much more considerable than in 1883; thus, the customs duties reached \$26,139,601, being \$924,192 greater than in 1883. During the first eleven months of 1885 the revenue from customs did not exceed \$21,299,874, whereas during the corresponding period of 1884 it had attained \$23,115,809. As the actual expenditure in 1884 was \$44,-874,666, there remained in the treasury on Jan. 1, 1885, including a balance from the previous year \$6,902,164. Without counting this balance, the revenue was estimated to have reached \$36,580,000 in 1885, while the budget for 1886 was fixed at \$35,080,000 income, and the outlay was estimated at the same figure. The foreign indebtedness outstanding on Jan.

1, 1885, amounted to \$33,843,000. The annual interest on the foreign debt amounts to \$3,405,419. There is a home debt, arising from expenditure during the war of independence, for railroads, and for the Spanish war, as well as for the one with Peru and Bolivia. Part of this debt bears from 3 to 7 per cent. interest, while there is a sinking-fund of between $\frac{1}{4}$ and 4 per cent. On Jan. 1, 1885, the domestic debt was \$53,500,626. Chili's total indebtedness was consequently, \$60,430,-329 on Jan. 1, 1885; but since then it has decreased \$3,350,000, the loan of 1878 repaid.

The Government withdraws from circulation and cancels annually \$1,500,000 paper money; and will continue doing so till it is reduced to \$16,000,000, and as much silver is kept in reserve in the treasury for the eventual resumption of specie payment in that metal. The Mint purchased, in 1885, \$72,122 worth of gold, against \$90,928 in 1884; and \$736,448 of silver, against \$1,637,414. It coined in gold, silver, copper, and nickel, \$647,287 in 1885, against \$1,981,371 in 1884. The paper money in circulation issued by banks is \$12,911,443.

There are, finally, four loan banks at Santiago entitled to issue notes to bearer with interest, making advances on real estate; the notes to be withdrawn at a fixed date.

Commerce.—The foreign-trade movement in Chili has been as follows:

MOVEMENT.	1884.	1885.
Import	\$52,886,846	\$41,218,725
Export	57,766,450	51,490,286
Total	\$110,658,296	\$92,709,011
Decrease	17,944,285

The imports, in two years, were as follow:

NATIONS.	1884.	1885.
From England	\$20,528,343	\$15,505,558
From Germany	10,259,540	7,116,525
From France	8,561,778	6,480,561
From Argentine Republic	3,434,152	3,288,239
From United States	4,160,570	2,721,265
From Peru	2,936,000	2,645,816
From other nations	3,006,168	8,515,961
Total	\$52,886,846	\$41,218,725

The exports, in the same years, were as follow:

NATIONS.	1884.	1885.
To England	\$41,955,582	\$39,578,588
To Germany	8,863,943	8,240,785
To France	8,767,369	2,705,012
To Peru	2,810,989	1,767,508
To United States	1,386,315	1,627,008
To Ecuador	1,014,998	452,907
To other nations	8,017,264	1,818,588
Total	\$57,766,450	\$51,490,286

The Chilian copper exportation has been, in 1882, 43,129 tons; in 1883, 41,229 tons; in 1884, 41,780 tons; in 1885, 37,000 tons. The Chilian nitrate of soda exportation has been:

DESTINATION.	1884.	1885.
To Northern Europe.....	Quintals. 10,390,810	Quintals. 8,554,687
To the Mediterranean.....	186,576	41,980
To the U. States on the Atlantic.....	1,211,714	827,296
To the U. States on the Pacific.....	49,073	77,712
Total.....	11,883,173	9,501,625

The American trade with Chili has been as follows:

FISCAL YEAR—	Imports from Chili into the United States.	Domestic exports from the United States to Chili.
1886.....	\$1,182,845	\$1,973,548
1885.....	604,525	2,192,672
1884.....	537,936	8,236,945
1883.....	435,584	2,887,551

Maritime Movement.—There entered and left Chili ports:

MOVEMENT.	Number.	Tonnage.
1884:		
Vessels arrived.....	9,833	8,455,072
Vessels sailed.....	9,938	8,573,694
Passengers arrived.....	44,430	Retained,
Passengers sailed.....	41,326	3,104
1885:		
Vessels arrived.....	9,090	7,975,399
Vessels sailed.....	8,247	7,916,797
Passengers arrived.....	46,759	Retained,
Passengers sailed.....	26,746	20,013

Resources.—Chili produces annually about 6,500,000 hectolitres of wheat, and 2,500,000 hectolitres of barley and other cereals, and all vegetables and fruit peculiar to the temperate zone. In 1884, 5,812,219 hectolitres of wheat were produced, and 11,437,560 decalitres of wine. The cattle increase at the rate of over 400,000 head per annum, while the annual increase in the number of sheep and goats is 1,000,000. Silver production amounts to 160,000 kilogrammes a year, that of gold to 500. Copper production averages 40,000 tons per annum; coal is mined to the amount of 800,000 tons, and nitrate to 550,000 tons. Manufacturing is rapidly developing; there are five steam flour-mills, a sugar-refinery at Vina del Mar, near Valparaiso, and at Santiago a cloth-factory turning out a creditable article from native wool. There are several agricultural, mining, manufacturing, and medical societies, publishing illustrated bulletins and reviews.

Manganese-Ores.—The deposits of manganese-ore in Chili may be said to never have been explored; nevertheless, enough is known from the investigations of several eminent geologists to leave no room to doubt that the mineral exists in immense quantities in the republic, more especially in the northern provinces. The first attempt to utilize the ore was made about three years ago, when a bed, south of Santiago, was opened; but the cost of conveying the ore to Valparaiso for shipment proved an insuperable obstacle to the success of the undertaking, and it was abandoned. The beds of manganese in the province of Coquimbo are surface deposits, and the cost of taking out the

ore is trifling, but the great difficulty is the expense of transportation to the coast. The cost of the ore by the time it is placed alongside a vessel in Coquimbo harbor ranges from \$10 to \$12, Chilian currency, per ton. The price of manganese in England is quoted to-day at £3 10s. per ton for ore of a ley of not less than 45 per cent. The ley of the ore exported from Coquimbo has varied from 45 to 55 per cent.

Education.—Gratuitous instruction was given to men in 17 schools in 1885, against 16 in 1884; to women in 7, against 5; elementary schools for children had increased from 240 in 1884, to 247 in 1885, for boys alone; for girls there were 187, against 188 in 1884, and for children of both sexes there were 310 schools, against 287 in 1884; together, 768 free schools, against 736 in 1884. There were enrolled, in 1885, 63,559 children of school age, against 70,382 in 1884, the average attendance being 45,795 in 1885, against 49,766 in 1884. Of private schools there were 557 in 1885, being 45 more than in 1884, and the number of pupils enrolled 26,011, so that the total number of children of age to attend school was 89,570. The amount of money spent by the Government for free schools was \$2,303,800, and the municipalities spent altogether \$90,000 for the purpose. Seminaries were supported by the Archbishop of Santiago, and the Bishops of Concepcion, Ancud, and Serena. Higher education is obtainable in the National Institute of Santiago, which, in 1884-'85, had 980 students, being an increase of 69 over 1884. There were, besides, the following educational establishments: At Santiago, a school for artists and mechanics; the Agricultural Institute, with a model farm; the Academy of Painting; the School of Sculpture, and the Conservatory of Music.

In April, 1885, there were 65,094 volumes in the National Library; there are a Museum of Natural History, a Botanical Garden, and Museum of Anatomy, and Cabinet of Physics, all attached to the National Institute.

There is a military school, attended by 115 cadets in 1885; a naval school at Valparaiso, with 70 cadets, in the same year, attached to which is a marine library; and the naval officers formed in that city, on April 10, 1886, an association to publish a monthly paper. At Santiago there is a hydrographic bureau, which prepares naval maps, and publishes the "Anuario de la Marina."

The Press.—There were published in 1886 128 newspapers, 25 of them at the capital, Santiago; 13 at Valparaiso; 5 at Iquique; 4 each at Concepcion, Copiapo, Curicó, Serena, and Talca; 3 each at Ancud, Anjeles, Cauquenes, Chillan, San Carlos, San Felipe, Vallenar, and Freirina; 2 each at Ligua, Melipilla, Osorno, Pisagua, Quillota, Quixihue, Rancagua, and San Fernando, and one in nearly every capital of a department.

Lighthouses.—Between Punta Arenas, near the Strait of Magellan, and Arica, 12 light-

houses with revolving and fixed lights are to be met with in chief ports, and of the latter kind several in minor ports. The service is increasing.

Merchant Marine.—There were afloat under the Chilian flag, on April 30, 1885, 35 steamers, with a joint tonnage of 17,265; 6 ships, with 7,341 tons; 86 barks, with 41,955; 6 brigs, with 1,745; 8 schooner-brigs, with 2,405; 9 schooners, with 989; and 16 sloops, with 915; together 166 vessels, with 72,614 tons, being an increase for the year of 5 steamers and 3 sailing-vessels.

CHINA, an empire in Asia. The present Emperor is Hwangti, born in 1871, the son of Prince Ch'un, brother of the Emperor Hien-fung. He succeeded to the throne on Jan. 22, 1875. The highest governing body is the Nei-ko, consisting of four members, two Chinese and two Tartars, with two assistants from the Han-lin, or university, who see that their acts are in conformity with the civil and religious laws. Under them are the Liu-pu, or six boards of government, each presided over by a Tartar and a Chinese. A seventh official board, dealing with the navy and coast defenses, was established in the latter part of 1885, in accordance with the dying counsels of the great statesman and general, Tso-Tsung-Tang. The Board of Censors is an independent body, any member of which has the privilege of presenting remonstrances to the Emperor. The governors of provinces exercise a high degree of authority, but are removable at the will of the central power. Entrance into the public service can only be gained by passing severe literary examinations that are held yearly.

Area and Population.—The area of China proper is estimated at 1,297,999 square miles, and the population at 383,000,000; the area of the dependencies of Manchuria, Mongolia, Thibet, Soongaria, and Eastern Turkistan at 2,881,560 square miles, and their aggregate population at 21,180,000—making the total area of the empire 4,179,559 square miles, and the total population 404,180,000. The area and population of the eighteen provinces of China proper, according to the latest official returns, are as follow:

PROVINCES.	Square miles.	Population.
Chili.....	58,949	17,937,000
Shaantung.....	65,104	86,247,585
Shansi.....	56,268	12,211,458
Honan.....	65,104	22,115,527
Kiangsu.....	44,500	20,905,171
Nganhwel.....	48,461	20,596,288
Kiangsi.....	72,176	24,534,118
Chehkiang.....	39,150	11,558,692
Fukien, with Formosa.....	53,489	25,790,556
Hupeh.....	70,450	33,365,005
Hunan.....	74,320	21,092,604
Shensi.....	67,400	8,482,198
Kansu.....	86,608	5,411,188
Szechuen.....	168,800	67,712,897
Kwangtung, with Hainan.....	79,456	29,706,249
Kwangsi.....	78,250	5,151,827
Kweichow.....	64,554	7,669,181
Yunnan.....	107,969	11,721,576
Total	1,297,999	382,978,840

There are twenty-two ports on the coast and on the Yangtse river that are open to foreign commerce under various treaties. Their names and population are as follow: Canton, 1,600,000; Tientsin, 950,000; Hankow, 700,900; Foochow, 630,000; Shanghai, 350,000; Ningpo, 240,000; Nanking, 150,000; Ching-kiang, 135,000; Taiwan, 135,000; Takow, 100,000; Tamsui and Amoy, 95,000; Wenchow, 80,000; Kelung, 70,000; Newchang and Wuhu, 60,000; Kiukiang, 53,000; Ichang, 34,000; Chefoo, 32,000; Swatow, 30,000; Kiungchow, 30,000; Pakhui, 25,000. The number of foreigners residing in the treaty ports in the beginning of 1885 was 6,364, of whom 2,704 were natives of Great Britain, 621 of the United States, 554 of Germany, and 424 of France. About half of the foreigners lived in Shanghai.

Confucianism is the state religion, but the bulk of the Chinese are Buddhists. The aboriginal hill tribes are Nature-worshippers. There are about 30,000,000 Mohammedans, chiefly in the southwest and northeast, 1,000,000 Roman Catholics, and 20,000 Protestant converts.

The Army.—Many improvements have been wrought in the Chinese military and naval organizations since the war in Tonquin. The active military forces consist of three armies, that of Manchuria, that of Turkistan, and that of the Center. The Army of Manchuria has a strength of about 70,000 men. It is divided into two army corps, with headquarters at Tsitsisar and Mukden, respectively. The infantry are armed to a considerable extent with Mauser rifles, and the artillery with 8-centimetre Krupp field-pieces. The Army of the Center, with headquarters at Kalgan, northwest of Pekin, has a strength of 50,000 in time of peace, which can be doubled in war-time. The men come from a strong and brave race, and are armed with Remington rifles. The Turkistan Army is employed constantly in keeping order on the western frontier. There are permanent Manchu garrisons in the large cities in the north and along the coast. The territorial militia, called Braves, numbers about 200,000 in peace-time, and can be increased to 800,000. There is a large Tartar cavalry force, but the horses are small, though strong, and the equipment worthless.

The Navy.—The Chinese Government had two powerful ironclads built at Kiel in 1885. They are sister ships, named the "Ting Yuen" and "Chen Yuen," of 7,335 tons, 6,000 horse-power, and a speed of 14½ knots, with 14-inch flat-faced armor. Each carries four 12-inch Krupp breech-loaders in two barbette towers, and two 6-inch guns. A smaller protected cruiser, also built in Germany, carries two 8-inch Krupp guns in a barbette and one 6-inch gun. Two swift unarmored steel cruisers, carrying two 8-inch Armstrong guns each, besides 40-pounders and machine-guns, were launched at Kiel in 1884; and two smaller ones, carrying two 25-ton Armstrong guns, and capable of steaming 16 knots, were constructed in Eng-

land in 1881. All of these vessels are attached to the North China squadron for the defense of the capital, which includes also 12 gunboats, each armed with a 26-, 35-, or 38-ton gun. This squadron has been brought to a high degree of efficiency under the instructions of Captain Lang, an English officer, who was admiral of the North China fleet, commonly called Li's fleet on account of being under the control of the Viceroy Li-Hung-Chang, when hostilities with France began. Not thinking it proper to engage in operations against France, he resigned his appointment. He was succeeded by Admiral Sebelin, a captain in the German Navy, who engaged many other German officers, introduced Krupp in the place of Armstrong guns, and made many other changes. The Chinese authorities, who had been greatly pleased with the work of Admiral Lang, who possessed the confidence of Li-Hung-Chang especially, dismissed Admiral Sebelin and the other Germans in this squadron early in 1886 and re-engaged the former admiral.

The Foochow, Shanghai, and Canton fleets include about 50 unarmored cruisers, corvettes, sloops, and gunboats. There have been added to the naval force recently several swift torpedo-boats for Whitehead torpedoes. A cruiser of 2,150 tons and 2,400 horse-power has been constructed in China, and several others are building. Besides buying large quantities of arms for the army in foreign countries, the Government has established arsenals which under the superintendence of foreigners turn out arms and ammunition at a rapid rate.

The new naval ministry at Pekin, which has the Prime Minister for its chief, Li-Hung-Chang for vice-president, and the Marquis Tseng for one of its members, is expected to control the entire fleet and naval defenses of the empire. Formerly the naval affairs of China were, like everything else, decentralized, each viceroy being required to defend his own province, and maintaining for the purpose such a naval establishment as he thought necessary.

Finances.—The total revenue amounts to about \$125,000,000, derived from taxes on land, grain, licenses, and the import and export duties, which are collected by foreign inspectors. The land-tax ranges from 75 cents an acre in the north to \$3.25 in some parts of the south. The customs duties amounted in 1884 to \$18,293,000. The largest part of the duties is paid on exports. The heaviest expense of the central Government is for the army, which costs about \$75,000,000 per annum. China contracted loans in 1874 and 1878 amounting to less than \$11,000,000, paying 8 per cent and secured on the customs receipts. A part of the principal was paid off; but in 1884 a silver loan of \$7,500,000 was raised abroad, and in 1885 others amounting to \$12,500,000, making the total foreign debt about \$23,000,000.

The exhaustion of the imperial hoard and of the provincial treasuries during the war in Tonquin suggested reforms in the financial ad-

ministration that have replenished the various treasures. The officials have formerly been allowed to enrich themselves by corrupt practices that have been winked at but not condoned by the Government. In a national emergency, like the war with France, these private hoards are called into requisition. By strict economy and watchfulness the Government has been able to replace the depleted treasures and to expend large sums on telegraphs and military and naval improvements without resorting to heavy public loans. Li-Fungpao, formerly minister to Germany, the Taoutao of Formosa, and other high functionaries, were disgraced and made to give up their irregular accumulations in order to avoid the dangerous expedient of a foreign loan, and officials who were spared are careful to give no offense in the present discharge of their duties. The public revenues are also largely increased by the additional imperial taxes permitted in the new opium convention.

Commerce.—The net imports of 1884 amounted to 72,760,780 haikwan taels, or about \$104,600,000; the total exports to 67,147,680 haikwan taels, or \$87,300,000. Of the imports, 30,770,453 haikwan taels came from Hong-Kong, 16,945,086 from Great Britain, 14,338,981 from India, 8,655,552 from Japan, 2,418,367 from the United States, and 1,752,222 from the Continent of Europe, not including Russia, whose share was 258,304 haikwan taels. Of the exports 19,465,553 haikwan taels were destined for Great Britain, 17,289,750 for Hong-Kong, 10,070,522 for the Continent of Europe, 8,279,598 for the United States, 5,488,681 for Russia, 1,795,815 for Japan, and 635,844 for India. The chief imports were opium, valued at 26,150,241 haikwan taels; cotton goods, 22,141,222 taels; metals, 4,096,870 taels; woolen goods, 3,709,678 taels; raw cotton, 1,784,451 taels; coal, 1,492,552 taels. The largest exports were tea, of the value of 29,055,142 taels; silk, chiefly raw, 23,382,241 taels; sugar, 3,760,088 taels; straw braid, 1,953,917 taels.

Navigation.—During the year 1884 the tonnage entered and cleared at Chinese ports was 18,806,788, of which 12,152,949 tons were British, 2,993,613 Chinese, 2,381,741 American, 939,706 German, 215,105 Japanese, and 93,963 French.

Telegraphs.—In December, 1884, the imperial telegraph system comprised 3,089 miles of line and 5,482 miles of wire, and it has since been greatly extended. A line between Pekin and Tientsin brings the capital into telegraphic communication with Newchang, Chefoo, Shanghai, Yangchow, Soochow, the seven treaty ports on the Yangtse, Canton, Fatshan, Woochow, and Lungchow, and with the southwestern provinces by a line running from Canton into Yunnan, constructed in 1885. Shanghai is connected with Foochow, Amoy, Kashung, Shoa-shing, and Ningpo. Lines have also been constructed between Foochow and Canton and between Taku and Port Arthur.

Commercial Treaty with France.—Negotiations between M. Cogordan, the French plenipotentiary, and Li-Hung-Chang, for the arrangement of the terms on which trade is to be conducted across the frontier between Tonquin and China, were carried on at Tientsin for nearly a year. The French sought to obtain large concessions, on the supposition that the result of the war enabled them to dictate terms, but the Chinese were resolved to yield as little as possible, and disputed trivial points in a contentious spirit in order to deprive France of even the semblance of exacting concessions. The delimitation of the Tonquin frontier advanced smoothly, but is not expected to be completed before 1888. The French demanded the right of keeping an official agent at Talifoo or Yunnan-fu, in Yunnan, but only obtained the stipulation that no other country should have that privilege. China agreed to open two places to trade: one above Laokai, giving access to Yunnan; and one on the frontier beyond Langson, at the entrance of the rich and populous province of Kwangsi. This provision was already contained in the treaty of Tientsin, signed on June 9, 1885. China will establish custom-houses at these points, and France may maintain consular agents there. China has the right to keep consuls in Hanoi, Haiphong, and other places in Tonquin, and is given favored-nation treatment in that country, with freedom of trade and residence. The French are accorded the usual rights in the open places in China. Only persons with Chinese passports can enter China from Tonquin. Imports across the frontier into China pay one fifth less than the maritime customs dues, and exports one third less. Articles not mentioned in the tariff pay 5 per cent. ad valorem in each case, and all such goods pay the *likin*, or inland transit dues, in the usual way. These reductions are not so great as those of the Russian overland tariff. The French plenipotentiary contended for a stipulation enabling France to impose a poll-tax on Chinese immigrants into Tonquin, and virtually obtained it in a vaguely worded clause. The reductions in the duties are not regarded by English merchants as sufficient to give the French any advantage in the trade of Southeastern China or Yunnan, at least not until Tonquin is tranquillized, French goods admitted duty free into Tonquin, and a railroad constructed to the frontier. Even then they can be counterbalanced by the opening of a treaty port on the upper Canton river. Lord Salisbury disputed M. de Freycinet's contention that the overland duties and the maritime duties stand on a different footing, and intimated that similar reductions could be demanded at the open ports under the favored-nation clause; yet no such claim was put forward by the British Government, which expects to reap the entire benefit of the commercial concessions obtained by France in the future trade across the Burman frontier. The

treaty provides for the absolute prohibition of the trade in opium between Tonquin and China. When asked to let the French build railroads in China, Li-Hung-Chang gave them permission to make tenders for a small line running from the Kaiping coal-mines to Tientsin, for which the contract was ultimately awarded to the Krupp Company, of Germany. The French were completely disappointed in their expectations of obtaining material commercial advantages, and repeatedly stopped the negotiations for several weeks at a time; but the Chinese statesmen had no fear of a resumption of hostilities.

Direct Representation of the Vatican.—A result of the French war, which weakened the position of France in China and her prestige in the far East, is the prospective revival of the direct relations between the Chinese Government and the Vatican that existed in former centuries, and the cessation of the protection over Catholic missions in China exercised by France, sometimes needlessly and mischievously for the sake of political effect. In July a convention was concluded with the Holy See, committing the charge of the interests of the Catholic churches and missionaries in China to a Papal internuncio at the Chinese court. Monsignor Aglardi was appointed by the Pope to this post. The Vatican acted in this matter in compliance with a request of the Chinese Government, which invited the Pope to send a plenipotentiary to Pekin while hostilities with France were still in progress. The French Government, in the beginning of August, informed the Vatican that if a Papal legate, with functions independent of France, were sent to Pekin, the French ambassador at the Papal court would be withdrawn. On Aug. 21 a fresh proposal was made to France, to the effect that if an envoy were sent by the Vatican he should have a temporary mission. The Curia agreed to send only a temporary envoy, if the Chinese Government would consent. The Chinese Government notified the Pope that no representative would be acceptable unless perfectly independent of France and other countries, through a legate possessing full and free diplomatic functions. The Papal court informed the various European governments of the compromise that had been effected with France, and ordered Archbishop Aglardi to depart on his mission. On Sept. 12 the Pope received an ultimatum from France, threatening that if an envoy of any description were sent to Pekin the ambassador at the Vatican would be recalled, the Concordat annulled, the church and state separated, and the grant of 50,000,000 francs a year to the Catholic Church in France suppressed.

The question had hitherto been complicated with that of the removal of the Petang, or North Cathedral, in Pekin, which the French Government utilized for the purpose of imposing its wishes on the Chinese Government. An arrangement by which the Catholic au-

thorities, with the approval of the Pope, agreed to the removal of the cathedral, was vetoed by France, although the missionaries were desirous to please the Chinese Government in this regard. The cathedral stands within the palace-grounds, and is an offense to the Chinese court because the towers overlook the palace-garden. The circumstance that the spire towers above the palace gives it, according to a universal Chinese superstition, a sinister influence over the fortunes of the royal house, with which the early death of the last two Emperors is associated in the popular mind. The site was presented to the Pope by the Emperor Kang-Chi, about two centuries ago. In 1862 the French Government insisted in rebuilding on the same site, against the protest of the Chinese Government, and has resisted all efforts to have the offensive structure removed. The Chinese are anxious and determined to have this mark of national humiliation, commemorating the fall of Pekin, removed before the coronation of the Emperor. The indemnity paid by China after the war of 1860 was used to rebuild the cathedral.

The Pope finally yielded to the pressure of France, and postponed the sending of an envoy to Pekin, but reserved liberty of action. On Sept. 14 he informed George C. Dunn, the Chinese special envoy, with whom the negotiations had been conducted, that the dispatch of a legate was for the present suspended, but that the agreement with China with regard to the rank and independence of the Papal mission to Pekin would be maintained.

All the foreign powers, except Russia, had already declared against further recognition of the French protectorate over Catholic missionaries of their own nationalities. The Chinese Government came to the decision that it would not recognize French passports except those of French priests, and would require from every Catholic missionary going into the interior a passport signed either by a consul of his own nationality, or by an accredited agent of the Pope. Demands for compensation or redress of injuries on behalf of missionaries must be made through the same channels. The Chinese Government contemplated sending an envoy to the Vatican, even though the Pope should not have a representative in Pekin. The French protectorate over missionaries rests on no formal treaty, but has been tacitly accepted since the war of 1860. During the Tonquin war, in which Christian converts were enlisted in the service of France against their fellow-countrymen, the dangers involved in the existence of a body of citizens not only owing spiritual allegiance to foreigners, but also looking to them for secular protection, was brought home to the Chinese Government.

Persecution of Christians.—In Chung-King, on the upper Yangtse, a mob on July 9 destroyed a newly constructed Catholic church, forced the missionaries to flee for their lives, and then

turned its fury against all Europeans, sacked their houses, and threatened their lives. The cause of this particular outbreak was probably the fact that the missionaries had covered the roof of their church with yellow tiles, choosing the color appropriated to the Emperor; though the Catholic priests spread a report ascribing it to the indiscreet conduct of American Protestant missionaries. The residence of the apostolic vicar was burned to the ground with all its contents. The property of American and English Protestant missionaries was likewise destroyed. The foreign consuls escaped by flight into other provinces. The scene of the outbreak was the largest city in the populous mountainous province of Szechuen. The disturbance spread through the eastern part of that province. Christian converts were killed wherever found; whole villages were destroyed. In northern Cochin-China similar outrages occurred. As many as fifty Christians were massacred there, their houses burned, and their lands devastated. The Chinese were predisposed to attacks on Christians by the fact that native converts had fought with the French in Tonquin. They were furthermore embittered against foreigners by the intelligence of the persecution and massacre of Chinamen in the United States. In June, an American Methodist lady missionary had been injured by a mob in Chung-King, and the authorities had treated lightly complaints made in this case. Previous to this, Mr. and Mrs. Fulton, and Miss Mary Fulton, of the American Presbyterian mission, had, on May 6, been driven out of Kwai Ping, four hundred miles southwest of Canton, and the mission station and hospital established by them were set on fire.

Port Hamilton.—In April, 1885, when war with Russia seemed probable, the British admiral on the China station, with the authorization of the Government, acting at the suggestion of Sir Harry Parkes, then minister at Pekin, took possession of Port Hamilton, a sheltered harbor formed by three small Corean islands, lying between Quelpaert and the mainland. The port thus annexed by Great Britain is situated in the midst of a group of islets, 38 miles from the northeast coast of Quelpaert, in 34° north latitude, and 127 $\frac{1}{4}$ ° east longitude. The harbor is spacious and safe, but the bottom is not good, so that moorings are required for firm anchorage. It was acquired as a coaling-station and naval port, lying nearly 2,000 miles nearer the Russian possessions on the Pacific coast than Hong-Kong, and commanding the Corean strait, which is always blockaded by British vessels when a war is anticipated. The sea routes between the Yangtse-Kiang, the northern ports of China, and the treaty ports of Japan, pass this point, which also commands the southern approach to the Russian naval arsenal of Vladivostock.

The islands are inhabited, but can not be depended upon to produce supplies of any kind, except fish. When the English took possession

of the port, it was reported that they anticipated Russian cruisers by only a few hours. Formal protests were made by China and Japan, but both powers were content to see the harbor in British possession rather than have it fall into the hands of Russia. The British Government intended to fortify the harbor, but has as yet taken no practical steps to do so. The naval officers who examined the position reported that the islands could not be adequately fortified without an excessive outlay, and advised the abandonment of the port. The British have erected buildings for troops and war materials on the islands, and have laid a submarine cable to Hong-Kong at a cost of £90,000, but have not yet erected a coaling-depot there. The fact that China does not acquiesce in the occupation deters them from treating the islands as definitely annexed to Great Britain.

CHOLERA. Notwithstanding much time was given to the study of cholera during the year 1886, the additions to our knowledge of the disease have not been as satisfactory as was hoped. Yet, as a result of the investigations (some carried on in the very home of the disease), several mooted points have been decided. By direction of the President of the United States, Dr. E. O. Shakespeare, of Philadelphia, visited Europe and Asia, as Government Commissioner, to investigate cholera and report to Congress. He sailed from New York in October, 1885, and returned in September, 1886, having visited the infected localities of France, Spain, Italy, and India. Cholera is now recognized as a preventable disease, and it is an accepted belief among physicians that to Dr. Koch, of Berlin, belongs the credit of having first discovered and described a peculiar curved bacillus in the intestinal contents and dejecta of persons suffering from cholera. He claims that this bacillus is diagnostic of true Asiatic cholera. The investigations carried on during the past year have confirmed four of the five claims, concerning this bacillus, that Koch advanced as the result of his investigations of the etiology of cholera in 1884. His fifth claim, that this curved bacillus not only constituted a most valuable diagnostic sign of cholera, but was also the active cause of the disease, has not been wholly substantiated; yet numerous inoculation experiments seem to show the correctness of his view. The recent investigations and experiments of the American commissioner are in accord with all but this latter claim. (For an account of Koch's claims, see *Zymotic Diseases* in the "Annual Cyclopaedia" for 1885.) Emmerich's claim for the etiological power of his Naples bacillus, in the production of cholera, has not borne the test of even his own observations during the past year. Pettenkofer's views, as to the unity of cholera morbus and cholera, have been rejected by almost the entire medical profession. The application of the exact knowledge that has been obtained, as a result of the study of the epidemic of 1886, is

of vast importance as concerns the selection of hygienic and preventive measures. The discovery of the comma-bacillus in the dejecta of a suspected case, points to the existence of Asiatic cholera; and in the light of our present knowledge the failure to apply this crucial test would be little short of criminal negligence on the part of health authorities.

Although recent investigations and research have brought to light hitherto unknown and unconjectured facts, yet almost all the advance has been made in the etiology of cholera, little having been made in our knowledge of its treatment. Experiences with the epidemics of 1884-'86 have not resulted in any improved or more successful method of treatment, and the ratio of deaths to persons attacked remains about the same—one third. That cholera is not directly contagious is now an accepted belief; and that an attack confers a limited immunity is also very probable. While pursuing his investigations in Spain, Dr. Shakespeare made careful inquiries as to the question of immunity, and found that, out of a large number of persons, who had suffered from cholera previously, only a few instances of second attacks were noted, and in most of these there were good grounds for believing that the subsequent attack had been one of cholera morbus, and not true, genuine Asiatic cholera. Communications were sent to every village and town in Spain, where cholera had existed, requesting a reply from the physicians practicing in the towns, to a series of questions bearing upon the disease, the question of immunity being one; and the replies showed that, in the experience of Spanish physicians, there were few instances of individuals having been attacked twice during the same epidemic. Such has also been the experience of those in our own country who have passed through epidemics, no instances of an individual having cholera twice being remembered. Medical men that have had experience with the disease have noticed, that usually a weakened, irritable condition of the intestines is left, often lasting through life; indiscretions in diet, sudden changes of temperature, water, or prolonged muscular exertion, would be followed by severe attacks of diarrhoea or dysentery. It is undoubtedly true that, with proper treatment in the earliest stages of cholera, three fourths of those attacked will recover; and this fact should be borne in mind, and advantage taken of prompt treatment the instant suspicious cases are observed in a community. After the disease has passed into its second stage, treatment does not yield such beneficial results, and in the final stage it is very unsatisfactory. Certain rapid, virulent cases occur, in the treatment of which almost nothing can be done, the patient being overwhelmed with the virulence of the poison. More extended observations during the past year have weakened the confidence that some physicians had expressed in the use

of anti-bacterial agents, and the hopes that had been born of the ether-treatment, and its effectiveness, have also been shattered. A new method of treating the disease has been employed by French physicians, during the epidemic of 1886, with considerable success, but there have not been a sufficient number of cases reported to enable us to express any opinion as to its real value. This treatment consists in painting the abdomen and loins thoroughly with collodion. It is claimed for this that heat is retained, and the abdomen is, as it were, placed in a perfect-fitting splint, and rest thereby secured. The collodion application is also said to prevent the rapid and great loss of the watery elements of the blood.

Treatment by means of ice to the spine, as recommended by Dr. Chapman, of England, has been tried to a considerable extent by physicians in India, no more success following this line of treatment than was observed in the opposite plan. Dr. Chapman recently expressed the opinion that cholera depended to some extent upon a severe nervous disturbance, and that treatment from this standpoint would yield a much more satisfactory result. India physicians, during the past epidemic, have given this treatment a trial, and have reported no increase in the ratio of cures under it.

No sooner had the year 1886 made its appearance, than cholera was announced in the provinces of Girona and Cadiz in Spain. That the disease should appear in these two localities, in opposite portions of the Spanish kingdom, at the same period, is regarded as evidence of the latency of the germ through the cold months. Notwithstanding the terrible lesson these people had received from the ravages of the epidemic in the past, they had failed to profit by it, and the sanitary condition of the country was not in the slightest respect improved; indeed, the condition of many of the towns was worse than in 1885. Quarantine regulations were very deficient, and sanitary cordons were not at all observed. No attention was given to purifying or protecting the water-supplies, the people still drinking water drawn from canals that had been made for the purpose of irrigation. Into these canals the drainage of small towns found its way, and, as they pursued their course through the country, instances of their being used for the purpose of washing soiled linen and clothes were quite numerous. These canals scarcely or never found their way into the larger cities, but traversed the rural districts mainly, and an evidence that they were the means of spreading the disease is shown in the fact, that cholera was more severe in the rural districts. The increased rate of mortality in rural districts has also been noticed in the other countries of Europe and in India. This relatively high rate of mortality in villages is also to be explained by absence of organized hygienic supervision, the miserable construction of the dwellings, in which the people are

crowded together with the domestic animals, and the impossibility of providing extensive and costly water-supplies.

In an official report of the epidemic in Spain, published May 22, 1886, it is said that the epidemic ended in the province of Malaga Jan. 19, in the province of Oviedo Jan. 31, in the province of Salamanca Jan. 17, and in the province of Cadiz March 22. Not a single case has appeared in the whole Spanish Peninsula up to the publication of this report. During this period of 1886, there were 2,000 cases and about 750 deaths from cholera in Spain.

Concerning the value of Ferran's anti-choleric inoculations, the opinions of Spanish physicians are still divided. That they are at least harmless, is beginning to be admitted. The last official commission, appointed by the Spanish Government, to examine the official statistics in their possession, have finally advised the resumption of the inoculations in the event of a recurrence of the disease.

An analysis of the recently published official statistics, collected by the officers of the Government, in the localities where the inoculations were practiced, comprising upward of 30,000 inoculations in 22 villages, having a population of 135,000, proved that only 387 of the inoculated were attacked, and 104 died of cholera; showing that 12 per 1,000 were attacked, and 3 per 1,000 died of the disease. On the other hand, of the population not inoculated, 77 per 1,000 were attacked, and 33 per 1,000 died of cholera. It would appear, therefore, that the inoculations conferred a protection from attack six times greater than that conferred by the measures of hygiene and prevention enforced in the villages, and that the inoculation conferred a protection from death by cholera ten times greater. It should be remarked that in many of these villages two thirds of the whole population were subjected to the inoculation, comprising the poorest class of the inhabitants, and, therefore, those most liable to attack. In such villages the epidemic suddenly came to an end, which appeared to be the result of the inoculation experiments. This sudden termination of the epidemic is in marked contrast with that in other afflicted villages; for an analysis of Dr. Shakespeare's investigations of 361 towns, mainly in this part of Spain, shows that the average duration of the epidemic was 44 days, of which the period of rise was 14 days, that its stationary period was 11 days, while the period of decline lasted 19 days.

Cholera in Italy, as in Spain, was found to be present during the winter months. Later in the year it occurred, more or less extensively, in the provinces bordering the Adriatic from Venice to Brindisi, and penetrated to some extent into the interior, mainly among the northeastern provinces. It is reported that there were upward of 45,000 cases and 14,000 deaths from cholera in Italy during 1886. The Ital-

ian Government during this year relied altogether upon local hygiene and sanitation, with medical inspection, disinfection, and isolation, as internal measures of prevention, having entirely abandoned the establishment of land quarantine and sanitary cordons. They have, however, in a more or less perfunctory manner, enforced a maritime quarantine, at the various Adriatic ports, against all infected places. In reference to the lax enforcement of quarantine by sea, Prof. Paglini, who was appointed by the Italian Government to investigate cholera in Sicily, in his official report severely criticises the manner in which it is conducted.

In France there were a few local epidemics of cholera in 1886, cases occurring in Brittany during the winter and spring months, which were nearly all traceable to introduction by persons or soiled clothing, and to the use of contaminated drinking-water. A case of undoubtedly cholera occurred at Mayence, on the Rhine, but the disease did not spread.

The empire of Austria, bordering on the Adriatic, and threatened by invasion from neighboring infected localities in Italy, has not escaped. At first the epidemic was limited to the port of Trieste, and the town of Fiume, the former having upward of 800 attacked and over 400 deaths. From the coast the disease slowly and irregularly spread to the interior, attacking towns in Dalmatia, invading Buda-Pesth, Prague, and a few other towns in Hungary, a few cases appearing even in Vienna, and the end of the year finds the disease still lingering in this empire.

Recent reports from South America indicate the appearance of cholera in the Argentine Republic.

During 1886 cholera made its most deadly ravages in Corea, Japan and Tonquin have suffered also to a great extent.

In Corea the rapidity of the spread of the disease, and the mortality were almost without parallel, in some cities the inhabitants being swept away by thousands, and some towns being literally depopulated.

The year closes with a decided abatement of the epidemic in Europe, without its complete extinction, and it is hoped that the germs of the disease will not survive the rigors of the winter; but should the difficulties in Bulgaria precipitate a general European war, while the disease still lingers in Austria, it is highly probable that in 1887 it will spread over the whole of Europe, and thus again seriously threaten this country.

CHRISTIAN CONNECTION. An account of the distinctive principles of this denomination, in both its Northern and Southern branches, and of the relations of those branches, was given in the "Annual Cyclopaedia" for 1882.

Statistical reports presented to the quadrennial meeting of the convention in October showed the total number of reported members in the Connection to be 79,266, or 10,000 more than were reported at the preceding meeting.

Estimating for the conferences and churches which had failed to report, and adding the 5,000 members of the colored conferences which were admitted at the present session, the membership would probably amount to 125,000; and if to these be further added the members of the Southern branch, the aggregate of the members adhering to the distinctive principles of the body would be 140,000.

The American Christian Convention met in quadrennial session at New Bedford, Mass., October 6. The Rev. J. W. Osborn, Ph.D., presided. In the reports concerning the business and benevolent concerns of the body, the assets of the Publishing-House were returned at \$36,834, and its liabilities at \$13,378. A reorganization was effected, by the operation of which the Convention and the Publishing Convention were brought into a closer identity. The missionary department reported that it had \$2,382 in cash on hand, of which \$1,100 belonged to the Home Mission fund, and \$1,281, which was in the treasury of the Woman's Missionary Society, to the fund for the establishment of a foreign mission. The Convention decided to begin its foreign missionary work in Japan. The educational institutions of the denomination were represented to be more prosperous than ever before. The colored school at Franklinton, N. C., had sent out eleven ordained colored preachers, and had fifteen students studying for the ministry. The office of General Evangelist was instituted, the incumbent to be a representative of the Convention in corresponding with churches and ministers and visiting the conferences. The North Carolina and Virginia (colored) Conference, having 5,000 church-members, was admitted to the Convention. Much attention was given to the discussion of the proposition for union with the Free-Will Baptist Church. A basis of union had already been drawn up and offered for consideration by a committee meeting in New York (see article "Baptists"), and Christian and Free-Will Baptist Associations in New York and Pennsylvania had agreed upon terms of union. A letter of greeting was received from the General Baptist Assembly of England, expressing sympathy with the movement for union. A deputation was received from the Free-Will Baptists, who presented a paper recognizing the common origin and parallel history of the two denominations and the interest with which the subject of union was regarded by the Free-Will Baptist people. After debate, a committee report was unanimously adopted, in which the greeting of the English General Baptists was responded to; the work which had already been done, and continued efforts for union on the basis of "the Scriptures as our only rule of faith and practice, guaranteeing individual judgment as the right and duty of all," were approved; efforts for union with the Christian Union people of the West were commended, and continued labor for union was pledged. A basis of union which

had been agreed upon with the Christian Union Church of Ohio, having about 20,000 members, was approved as follows: "1. The Bible our only rule of faith and practice; 2. Christ the only head of the Church; 3. Christian character the only test of fellowship; 4. Individual interpretation of Scripture the right and duty of all; 5. The union of all the followers of Christ, without controversy; 6. Each local church to govern itself." The original paper contained a seventh article, disowning the preaching of party politics, protest against which is a prominent feature in the discipline of the Christian Union Church; but the Convention considered this to be a matter for the local church, fully provided for under the sixth article, and its special adoption was waived.

CITIES, AMERICAN, RECENT GROWTH OF. The material for the following articles has been gathered, at our request, by correspondents in the various cities. In some cases it is necessarily imperfect; but it is believed that the whole will give a fair idea of the recent rapid expansion of our American cities. The subject will be continued, with other cities, in the next volume of this "Cyclopædia."

Albany, a city of Albany County, N. Y., capital of the county and State, on the west bank of Hudson river, 145 miles above New York; latitude $42^{\circ} 40'$ north, longitude $73^{\circ} 45'$ west. The population was 69,422 in 1870, 90,758 in 1880. The new Capitol, which will probably cost \$20,000,000, is slowly approaching completion. The new City Hall is deemed one of the most beautiful buildings in the country. A Protestant Episcopal cathedral is in course of erection, to cost, when completed, \$500,000. The river is now crossed by three bridges here, two of which are for railroads only. The West Shore route has been added within a few years to the railroad facilities of the city. Washington Park, containing over 81 acres, has cost the city more than \$1,000,000. Albany was the first city to light all its streets with electricity. Plans are under consideration for substituting the Andrews gang-wells, such as are in use in Brooklyn, for the present method of supplying the city with water by pumping from the Hudson. Among the manufactures recently grown to importance are those of confectionery, shirts, and collars. Following are statistics of some of the most important industries, as reported in 1880:

MANUFACTURES.	Capital.	Value of products.
Foundry and machine-shop products	\$3,070,959	\$2,656,685
Liquors, malt	1,948,600	2,641,600
Boots and shoes	652,545	2,287,616
Malt	1,322,688	1,348,888
Bread and other bakery products	547,185	1,157,959
Clothing, men's	405,541	917,646
Printing and publishing	1,032,500	875,025
Slaughtering and meat-packing	193,000	804,773

The entire amount of capital invested in manufactures was \$14,684,130; the number of employés, 11,785; and the total value of prod-

ucts, \$21,751,009. The total valuation of property was \$33,746,992. The bi-centennial of the city's incorporation was observed July 18-22, 1886, with the most elaborate municipal celebration ever known in this country. See **ALBANY, CELEBRATION AT.**

Allegheny, a city of Allegheny County, Pa., on Allegheny river, opposite Pittsburgh. The population in 1870 was 53,180; in 1880, 78,682; in 1886 it was estimated at 89,500. A new fire-proof library building, now in process of erection, is to cost \$250,000. The total valuation of property in 1880 was \$41,157,496. Following are statistics of the most important industries for that year:

MANUFACTURES.	Capital.	Value of products.
Iron and steel	\$1,776,364	\$2,084,364
Leather, curried	505,000	1,617,000
Leather, tanned	547,500	1,529,745
Foundry and machine-shop products	978,700	1,167,187
Paints	925,000	1,005,788
Cotton goods	596,935	734,250
Liquors, malt	556,000	666,712

The entire amount of capital invested in manufactures was \$8,451,059; the number of employés, 6,471; and the total value of products, \$13,731,792.

Atlanta, a city of Fulton County, Ga., capital of the county and State, 171 miles west by north of Augusta. The population, which was 21,789 (9,929 colored) in 1876, is now estimated at 60,000 (24,000 colored). There are practically eight railroad lines centering in the city, each having extensive through connections and branch-line feeders. The water for fire and sanitary purposes is furnished from water-works near the city; but the drinking supply, which, till lately, has been dependent on private wells, is now drawn from a single artesian well, affording a supply of pure water from a depth of 1,600 feet, all except the first 54 feet being through solid granite, and distributed through pipes, free of charge, to consumers. It is estimated that this well will furnish drinking-water for a population of 300,000. The entire value of property in the city, including the State and Government buildings, is estimated at \$31,670,894. It has been selected as the site for a permanent U. S. military post. The lumber-trade is very large, and is estimated to be doubling itself every year. There are 25 dealers and mill-owners, and the local trade will amount this year to 40,000,000 feet, the foreign to over 50,000,000. Atlanta is headquarters for yellow-pine lumber. There are three cotton factories, and the cotton receipts for the last season amounted to 171,000 bales. Other branches of trade and manufacture are increasing rapidly.

Auburn, a city, and the county-seat of Cayuga County, N. Y., 174 miles, by rail, west of Albany, and two miles north of Owasco Lake; latitude, $42^{\circ} 55'$ north, longitude, $76^{\circ} 35'$ west. The population in 1870 was 17,225; in 1880, 21,924; and in 1886 it was estimated at 26,-

000. A new Government building, to cost \$150,000, is in course of construction. The total valuation of property in 1880 was \$8,-804,449. The following are statistics, for the same year, of the principal manufactures:

MANUFACTURES.	Capital.	Value of products.
Agricultural implements.....	\$1,231,000	\$2,416,075
Woolen goods.....	940,000	1,292,901
Boots and shoes.....	181,800	591,498
Foundry and machine-shop products.....	152,000	299,177

The whole amount of capital invested in manufactures was \$4,423,950; the number of employés, 4,518; and the total value of products, \$7,719,409.

Augusta, a city of Georgia, capital of Richmond County, at the head of navigation on the Savannah river, 132 miles by rail north-north-west of Savannah. The population has increased rapidly in consequence of the erection of extensive cotton-factories. In 1876 it was 15,386; the census of 1885 fixes it at 35,000. The annual cotton-trade amounts to 175,000 bales. Among the industrial establishments, besides the cotton-factories, are flour-mills, fertilizer-manufactories, lumber-mills, cotton-seed-oil factories, an ice-factory, and a cotton-compress. Augusta now ranks third in wealth and population among the cities of Georgia.

Baltimore, the chief city and port of entry of Maryland, on an arm of the Patapsco river, twelve miles from Chesapeake Bay, and 178 miles from the Atlantic, 38 miles by rail northeast of Washington, and 185 miles southwest of New York. The population, 267,354 in 1870, had increased to 332,313 in 1880, and 412,000 in 1886. There are now sixteen public squares in the city, and the parks, Patterson and Druid Hill, contain, respectively, 112 and 93 acres. The churches, of which there were 220 ten years ago, now number 300. Water is supplied by two systems, the Jones's Falls and the Gunpowder river, which furnish about 165,000,000 gallons daily. The Gunpowder system is of more recent construction than the Jones's Falls system, having been begun in 1875 and finished in 1880. It includes Loch Raven, Lake Montebello, and Lake Clifton. Loch Raven and Lake Montebello are connected by a tunnel, nearly seven miles long, having an internal bore of twelve feet and a fall of one foot to the mile, and running 4½ miles through solid rock. Its cost was \$1,779,-610.24. Lake Montebello is the receiving reservoir of the Gunpowder supply. The water passes from it through a twelve-foot conduit 5,410 feet long, to Lake Clifton, a storage reservoir just beyond the city limits. Six distributing mains, each forty inches in diameter, bring the water into the city. The cost of the system was about \$4,500,000. The total storage capacity of the two systems is 2,305,000,000 gallons, and the total cost was about \$10,000,000. Baltimore has fourteen lines of street-cars, ample railroad facilities, and nine

lines of steamers to European ports, while there were but two lines ten years ago. In 1875 the value of imports was about \$27,788,992, and of exports about \$27,616,822; in 1885 the value of imports amounted to \$11,853,317, and of exports to \$45,041,634. In 1884, 38,507 immigrants arrived, and 15,927 in 1885. The depth of the channel has been increased from 17 feet at mean low water to 27 feet, with an average rise of tide of about 18 inches. The number of public schools has risen within the last ten years from 110 to 122, with 880 teachers and 38,036 pupils, and costing from \$650,000 to \$675,000 a year. Two medical schools have been established, making five in all, and one dental college, of which the city now has three. The Pratt Free Library has about 40,000 volumes, and the number is constantly increasing.

Boston, the capital of the Commonwealth of Massachusetts and of Suffolk County, and the chief city of New England, in latitude 42° 21' north, longitude 71° 4' west, at the western extremity of Massachusetts Bay, 213 miles by rail northeast of New York. The population in 1870 was 250,526; in 1880, 362,839; and in 1885, 390,393. The immigrants for the year ending June 30, 1886, numbered 23,950. The assessed value of property in 1875 was \$793,961,895; in 1886 it was \$710,581,700. The total debt on April 30, 1876, was \$43,938,165; in 1886 it was \$43,803,322.

The following table shows the increase in trade during the same period:

ITEMS.	1874-'75.	1885-'86.
Imports.....	\$51,982,226	\$58,480,707
Exports.....	30,866,088	63,428,513
Entrances in foreign trade.....	2,389	2,592
Tonnage of same.....	768,678	1,183,067
Clearances in foreign trade.....	2,189	2,498
Tonnage of same.....	632,878	1,018,911
Entrances in coastwise trade.....	1,117	783
Tonnage of same.....	1,079,488	\$12,590
Clearances in coastwise trade.....	1,608	838
Tonnage of same.....	1,245,208	898,626
Vessels belonging in the district.....	999	763

It should be noted that there is a large number of vessels in the coastwise trade that are not required to report at the custom-house. The number of entrances of steamships in 1885 was 522, with tonnage of 749,924, clearances 438, with tonnage of 622,736. The average weekly sales of wool, reported at about 1,000,000 pounds in 1875, now range from 4,000,000 to 7,000,000 pounds. The annual sales of merchandise have increased in the same time from \$1,200,000,000 to \$1,500,000,000. The industries showing the largest advance in the value of products from 1875 till 1880 are, leather, from \$1,884,745 to \$3,381,156; metallic goods, from \$2,398,588 to \$7,324,458; clothing, from \$16,738,244 to \$19,833,959; machinery, from \$4,223,996 to \$5,950,628. The number of national banks has risen from 53 to 59; the number of savings-banks has fallen from 20 to 15, but the deposits in them have increased from \$70,000,000 to \$86,011,644. Brighton, the great cattle-

mart of New England, has slaughtering and packing establishments with a capacity of 500,000 hogs annually, which furnish a large part of the foreign exports of the city. There are also extensive manufactures of oleomargarine in the same section. The original area of Boston proper, or Old Boston, has been increased from 690 acres to 1,829 by reclaiming flats and widening the Neck. By annexation of suburbs, the city has been further increased, till it now numbers, exclusive of islands, 22,921 acres. The public park system, established in 1875, consists of a chain of parks, 1,042 acres in all, extending from the Charles River Embankment, an esplanade of 10 acres, west of the Public Garden, to Franklin Park, 518 acres, in West Roxbury, and including Bussey Park and Arnold Arboretum, 167 acres, Back Bay, 106 acres, and Riverdale, 110 acres. There are also included in this system Marion Park, at City Point, South Boston, 50 acres, with a pier $\frac{1}{2}$ mile in length, and New Island Park in East Boston, 81 acres. A new court-house was begun in 1885 on Pemberton Square. The Army and Navy Monument, 70 feet in height, with statues and bas-reliefs, standing on the Common, designed by Martin Milmore, was erected in 1877. The church organizations have increased to 220. The new Trinity Church, on Copley Square, is one of the finest church-buildings in the country. It is in the Romanesque style, in the shape of a Latin cross; the extreme length is 160 feet, width, 121 feet; the great central tower is 211 feet high. The cost was \$750,000. The New Old South Church was built in 1875, at a cost of \$500,000. It is in the North-Italian Gothic style, and has a tower 248 feet in height.

The average number of pupils in the public schools was 49,317 in 1875-'76, and 60,823 in 1885-'86; the total expenditure for them was \$2,015,381 in 1875-'76, and \$2,036,469 ten years later; \$362,796 was expended for new school-houses in 1885-'86. A Latin School for Girls was established in 1878. There are about 100 private schools with an attendance of about 7,250. The Public Library, which contained about 300,000 volumes ten years ago, now has over 460,000 and 115,000 unbound pamphlets, besides manuscripts, engravings, and periodicals in the reading-room. The new Library Building, on Dartmouth and Boylston Streets, was begun in 1886. The number of volumes in the Boston Athenaeum has increased from about 100,000 to over 150,000. New theatres are the Park, 1879, and the Hollis Street, 1885. The last-named occupies the site of the historic Hollis Street Church, dating from 1752.

Binghamton, a city, capital of Broome County, N. Y., at the junction of the Chenango and Susquehanna rivers, 142 miles by rail west-southwest of Albany; latitude 42° 7' north, longitude 75° 56' west. The population was 12,692 in 1870, 17,317 in 1880, and 22,040 in 1886. It is on the main lines of the Erie,

Delaware and Lackawanna, and Syracuse, Binghamton and New York Railways, and is the terminus of the Utica and Chenango Valley and the Albany and Susquehanna. The Chenango Canal is now abandoned. Water-power for manufacturing purposes is obtained from both the Susquehanna and Chenango rivers. Among other manufactures, that of cigars has grown rapidly, so that the city now ranks among the leading cities of the country in this industry. During the year ending June 30, 1886, 79,330,976 cigars were manufactured there. Four street-railways are in operation; there are 9 public schools, 18 churches, 7 banks and 3 daily newspapers. A new State Armory has been erected and the building formerly in use as the State Inebriate Asylum has been enlarged and made a State Asylum for the Chronic Insane.

Bridgeport, a city, and one of the capitals of Fairfield County, Conn., on Long Island Sound, at the mouth of Pequonnock river, 59 miles by rail northeast of New York; latitude 41° 10' north, longitude 73° 11' west. The population, 18,969 in 1870 and 27,643 in 1880, has increased by annexation and otherwise to 40,000 or more. There are five national and four savings banks, with a united capital of \$5,500,000. There are 28 churches, a hospital, an orphan asylum, and a system of associated charities; also a free public library and reading-room, with about 12,000 volumes. The public-school system includes a high-school; and there are three public parks, the finest of which is Seaside Park. The total valuation of property was \$11,720,503 in 1880. The most important manufacturing industries in 1880 were:

MANUFACTURES.	Capital.	Value of products.
Foundry and machine-shop products.....	\$222,726	\$486,185
Cutlery and edge tools.....	213,000	443,800
Shirts.....	112,950	442,490
Springs, steel, cast and carriage.....	65,250	351,341
Hardware.....	261,850	324,876

The whole amount of capital invested in manufacturing was, \$9,751,785; the number of hands employed, 7,508; and the value of products, \$10,458,212.

Brockton, a city of Plymouth County, Mass., twenty miles south of Boston, on the main line of the Old Colony Railway; latitude 42° 8' north, longitude 72° 1' west. It was originally known as a part of Duxbury plantation or Sackett, afterward as a part of Bridgewater and as North Bridgewater. The name was changed to Brockton in 1874. It was made a city in 1882. The population in 1870 was 8,007; in 1880, 13,608; in 1886, 22,000. The principal industry is the manufacture of boots and shoes, especially men's shoes. There are about 90 manufactures, with 5,000 employés, whose annual wages amount to \$2,500,000. The value of the manufactures amounts to \$10,000,000. Other industries are the manufacture of machinery, boxes, sewing-machine needles, furni-

ture, lasts, dies, and shoe machinery and tools. Brockton has 3,330 dwellings, 15 business blocks of brick, a public library of 11,000 volumes, 15 churches, 3 banks, 3 newspapers, two of which are dailies, and a street railroad with nine miles of rails. In the town are valuable deposits of fine granite, which as yet have been only partially worked. The total valuation of property in 1880 was \$5,977,488.

Brooklyn, a city and the capital of Kings County, N. Y., on the west end of Long Island, opposite New York city, from which it is separated by East river; latitude $40^{\circ} 41' \text{ north}$, longitude $73^{\circ} 59' \text{ west}$. The population was 396,099 in 1870, of whom 144,718 were foreigners; and in 1880, 566,663, of whom 177,694 were foreigners. Very recently the city limits have been extended to take in the town of New Lots, thus largely increasing the area and population, which latter is now estimated at 725,000. In connection with Prospect Park has been laid out and completed a number of boulevards 200 feet wide leading to it from various directions. The Concourse at Coney Island, covering an area of 70 acres and having a beach-front of 750 feet, is under the control of the Brooklyn Park Committee. The city and the county are jointly interested in it. The most important public work of recent years is the East River Bridge, which was formally opened May 24, 1883. (See EAST RIVER BRIDGE, under ENGINEERING, in the "Annual Cyclopædia" for 1883.) An elevated railroad runs from Fulton Ferry to the end of the bridge, and from that point to East New York. A steam-dummy road runs on Third Avenue from Greenwood to Fort Hamilton. Four steam-railroads and one horse-car line run from within the city limits to Coney Island. The total length of horse-railroads is 151 miles (1880). The number of churches has increased from about 260 to 306, and the 48 public schools to 66. Seven daily and 14 weekly newspapers are published in the city, as well as 11 monthly and 2 semi-monthly periodicals. The Brooklyn Library, formerly the Mercantile, now numbers 90,000 volumes. The Young Men's Christian Association also has a fine library. Two new theatres have been built within the last ten years. The extensive Erie and Brooklyn Basins, on Gowanus Bay, are completed. The value of merchandise (chiefly molasses, sugar, grain, coffee, oil, hides, and wool) annually stored between Red Hook Point on the south and Main Street on the north is estimated at \$300,000,000. There are 12 national and State banks and 13 savings-banks. On January 1, 1886, the latter had deposits amounting to \$79,278,297; the number of depositors was 214,483. The water-supply has been added to by wells driven between Hempstead and Jamaica, and the number of pumps is constantly increased. The total valuation of property in 1880 was \$232,925,699. Although many of its inhabitants find employment in New York, Brooklyn ranked in 1880 as the

fourth city of the country in manufactures, while in population it was the third. The following table presents statistics of some of the principal industries:

MANUFACTURES.	Capital.	Value of products.
Sugar and molasses, refined.....	\$10,946,000	\$59,711,168
Slaughtering and meat-packing.....	1,125,000	8,010,492
Foundry and machine-shop products.....	4,079,250	6,984,582
Bread and other bakery products.....	1,020,375	5,694,975
Paints.....	2,602,800	6,284,201
Varnish.....	716,500	874,655
Carpentering.....	1,229,678	5,124,407
Drugs and chemicals.....	8,449,650	4,900,838
Patent medicines and compounds.....	55,000	730,046
Liquors, malt.....	8,888,500	4,871,772
Cordage and twine.....	2,566,700	3,915,566
Clothing, men's.....	932,445	2,937,262
Flouring- and grist-mill products.....	662,500	2,896,508
Cooperage.....	918,700	2,512,741
Tobacco, chewing, smoking, and snuff.....	1,059,890	2,802,708
Tobacco, cigars, and cigarettes.....	276,590	977,450
Ship-building.....	768,050	1,999,788
Hats and caps (not including wool hats).....	538,915	1,978,145
Lumber, planed.....	676,500	1,707,821
Boots and shoes.....	311,885	1,819,998
Boxes, wooden packing.....	998,500	1,767,640
Leather, dressed skins.....	691,650	1,755,144
Stamped ware.....	870,000	1,656,829
Printing and publishing.....	889,254	1,549,748

The whole amount of capital in manufacturing was \$61,646,749; the number of employés, 47,587; and the total value of food-products, \$177,223,142.

Buffalo, a city, port of entry, and the capital of Erie County, N. Y., at the eastern extremity of Lake Erie, at the head of Niagara river, and at the mouth of Buffalo creek; 422 miles by rail west of New York city; latitude $42^{\circ} 53' \text{ north}$, longitude $78^{\circ} 52' \text{ west}$. The population in 1870 was 117,714, of whom 46,237 were foreigners; in 1880, 155,184, of whom 51,268 were foreigners. Very many of the streets are paved with asphalt, and there are four public parks connected by eighteen miles of boulevard. Nineteen railroads enter the city, and the railroad-yard facilities are unequalled. Four steamboat lines afford regular communication between this port and other ports on Lakes Erie, Huron, Superior, and Michigan, using 56 first-class steamers, with capacity ranging from 1,750 to 2,800 tons. The number of pupils in the public schools was 15,875 in 1876, and in 1886, 28,372. The number of volumes in the Grosvenor Free Reference Library has increased in the same time from 20,000 to 32,000 volumes, and the Circulating Library of the Young Men's Association from 30,000 to over 53,000. The Historical Society has over 7,000 volumes, and there are in all 14 public libraries and reading-rooms. The 95 churches have increased to 120. The value of imports from Canada for the year 1874-'75 was \$2,499,004, and of exports to Canada \$766,945. For the year 1885-'86 the imports from Canada amounted to \$5,901,772, and the exports to \$349,860. The receipts of grain and flour were nearly 74,250,000 bushels in 1875, and 90,000,000 in 1886. The total valuation of property in 1880

was \$83,910,533. Following are statistics of the principal manufactures in that year:

MANUFACTURES.	Capital.	Value of products.
Foundry and machine-shop products	\$8,080,918	\$3,577,029
Slaughtering and meat-packing	872,500	2,441,250
Glucose	1,750,000	3,075,000
Clothing, men's	1,090,900	2,747,475
Flouring- and grist-mill products	940,000	2,251,848
Malt	1,842,000	2,002,838
Leather, tanned	1,977,000	1,757,600
Liquors, malt	1,859,975	1,636,020
Lumber, planed	1,188,000	1,219,406
Soap and candles	579,000	1,176,840
Boots and shoes	490,146	1,063,296

The whole amount of capital invested in manufacturing was \$26,847,937, the number of employés 18,021, and the value of products \$42,937,701.

Cambridge, a city, and one of the shire towns of Middlesex County, Mass., latitude $42^{\circ} 23'$ north, longitude $71^{\circ} 7'$ west, directly adjacent to the city of Boston on the west, and separated from it by the Charles river, which is spanned by six bridges, with a seventh proposed, to cost \$425,000. Founded in 1631, and originally called Newe Towne, Cambridge became a city in 1846, with a population of something less than 15,000; in 1870 it had 39,634; in 1880, 52,669; and in 1885, 59,660. The city has 82 miles of streets; the sewerage has been much improved in recent years. There are 33 public schools, six banks, and four weekly newspapers. The streets are lighted with gas and electricity, and a horse-railway uses 40 miles of track. Prominent among the business establishments are the Riverside and University presses, and a noted telescope-manufactory. The total valuation of property in 1880 was \$49,235,098. The principal manufactures were as follow:

MANUFACTURES.	Capital.	Value of products.
Slaughtering and meat-packing	\$560,500	\$7,179,625
Soap and candles	375,500	1,958,604
Printing and publishing	813,200	785,443
Bookbinding and blank-book making	144,000	202,455
Musical instruments, organs, and materials	593,000	788,222
Musical instruments, pianos, and materials	54,200	161,900
Furniture	275,000	615,191
Bread and other bakery products	121,600	579,856
Foundry and machine-shop products	187,734	509,326

The whole amount invested in manufacturing was \$6,480,799, the number of employés 7,543, and the total value of products \$26,605,688.

Camden, a city, and the capital of Camden County, N. J., in latitude $39^{\circ} 57'$ north, longitude $75^{\circ} 7'$ west, on a plain on the Delaware river, opposite Philadelphia, with which it is connected by ferries. The population in 1870 was 20,045; in 1880, 41,656. It is a terminal point of four railroads. It has a fine new courthouse, three national banks, and two hospitals. The total valuation of property in 1880 was \$11,566,085. The principal manufacturing industries were:

MANUFACTURES.	Capital.	Value of products.
Foundry and machine-shop products	\$815,000	\$1,298,050
Woolen goods	570,000	754,500
Drugs and chemicals	800,000	751,613
Ship-building	454,400	485,576
Lumber, sawed	445,000	307,900
Boots and shoes	23,415	240,975

The whole amount of capital invested in manufacturing was \$5,032,835, the number of employés 4,370, and the total value of products \$7,644,705.

Charleston, the chief port and largest city of South Carolina, capital of Charleston County, on the peninsula at the confluence of the Ashley and Cooper rivers, 100 miles south-southeast of Columbia and 82 miles northeast of Savannah; latitude $32^{\circ} 45'$ north, longitude $79^{\circ} 57'$ west. The population was 56,540 in 1875; in 1880, 49,984; and about 60,000 in 1886. The ship-channel over the bar formerly had 16 feet of water at ebb; but this depth has been materially increased by the construction of jetties, springing respectively from Sullivan's Island and Morris Island. When they are completed it is believed that a channel will be formed showing a depth of 26 feet. The city suffered greatly from the effects of a cyclone in 1885; and in August, 1886, it was visited by a severe earthquake. About 40 persons were killed by the falling buildings, and the loss of property within the corporate limits is estimated at \$5,000,000. The value of imports and exports has materially increased in recent years.

Chelsea, a city of Suffolk County, Mass., latitude $42^{\circ} 25' N.$, longitude $71^{\circ} W.$. It is separated from Charlestown on the southwest by the Mystic river, there crossed by a long bridge, from East Boston by Chelsea creek, and connected with Boston proper by the Eastern Division of the Boston and Maine Railroad. Two lines of horse-cars enter the city. Originally a part of Boston, it was set off in 1739, and became a city in 1857. The population was 18,547 in 1870, 21,782 in 1880, and 25,709 in 1885. The largest industries in 1880 were the manufacture of foundry and machine-shop products, with \$516,000 capital and \$464,000 worth of products; curried leather, \$53,300 capital, \$793,263 worth of products; cotton goods, \$405,000 capital, \$511,340 worth of products; tobacco, cigars, and cigarettes, \$84,950 capital, \$110,284 value of products. The entire amount of capital invested in manufacturing was \$1,822,250, the number of employés 1,647, and the total value of products \$3,846,250.

Chicago, the principal city of Illinois, capital of Cook County, the commercial metropolis of the Northwestern States, on the west shore of Lake Michigan, 18 miles north of its extreme southern point; latitude $41^{\circ} 50'$ north, longitude $10^{\circ} 33'$ west from Washington. The population in 1870 was 298,977, including 144,557 foreigners; in 1880 it was 503,185, including 204,859 foreigners; estimated by the school

census in 1886, it was 703,461. In 1876 there were four trunk lines, furnishing communication with the East, and six with the West; two running southward to the Gulf of Mexico and the Southwestern States, and two northward to the Lake Superior region. In 1886 there were eight lines to the East, five to the West, six to the Southeast, South, and Southwest. Three of the great railway systems reaching West from Chicago embrace from 4,000 to 5,000 miles of line each, and the aggregate mileage of the roads having termini at Chicago, including nothing east of Pittsburg, is nearly 30,000 miles, or one fourth of the railway mileage of the country. The harbor has recently been further improved by the construction of a new breakwater, built by the Government at a cost of over \$1,000,000. The 24 miles of improved water-frontage on the river and its branches have been increased to 30 miles. The facilities for street-travel are improved by the addition of cable-cars traversing the North and South Divisions of the city. In 1876 there were sixteen national banks, with resources to the amount of \$41,364,479, capital stock and surplus \$12,027,500, and deposits \$25,687,802. Other commercial banks had an aggregate capital of about \$5,000,000, and deposits probably exceeding \$7,000,000. There are now fourteen national banks, with resources to the amount of \$96,000,000, capital stock and surplus \$15,000,000, and deposits \$67,000,000. Other commercial banks have an aggregate capital of about \$10,000,000, and deposits probably exceeding \$15,000,000. The public schools have increased in number in ten years from 41 to 60, occupying 82 buildings; the number of teachers from 700 to 1,195; the number of pupils enrolled from 49,121 to 76,044, and the total expenditure from \$827,503 to \$1,537,172, \$924,229 of which is for teachers' wages. There are now three high-schools, and also night-schools for those who can not attend by day. The number of newspapers and periodicals published in the city has risen from about 120 to about 400, ten of which are dailies. Ten years ago there were about 250 churches; there are now about 350. The County Hospital affords room for 800 patients. The city and county have built a court-house and city-hall of granite and marble, two connected buildings of the same design, at a cost of \$3,000,000 each. A Board of Trade Hall, begun in 1880, was finished in 1885, at a cost of \$1,700,000. In the neighborhood of this hall twenty great office-buildings were built between 1880 and 1886, averaging eight stories in height, and costing from \$300,000 to \$1,250,000 each. In 1875 the valuation of property for the purpose of taxation was \$293,188,950, the tax levied thereon \$5,123,905, and the bonded debt of the city \$13,456,000. In 1885 the valuation of property was \$139,958,288, the tax \$5,152,515, and the debt \$12,695,500. The value of duty-paying goods imported in 1875 was \$3,844,884, in 1885 it was \$8,624,117. In 1875 there were 17 elevator ware-

houses, with an aggregate capacity of 15,250,000 bushels; there are now 29, with a capacity of 27,025,000 bushels. The number of pork-packing firms has increased from 32 to 40. In the year ending March 1, 1886, they packed 4,928,780 hogs—about 50 per cent. of the pork-packing in the entire Mississippi valley. The value of the live-stock receipts in 1875 was estimated at \$117,533,941, and in 1885 at \$173,598,002. Live-stock arrivals averaged, during the last named year, 600 car-loads a day. The Union Stock-Yards cover 350 acres, 275 of which are roofed. In the winter, 25,000 men are employed at the stock-yards in receiving, preparing, packing, and shipping. A single firm uses 23 acres of floor-space. The fresh-beef trade has grown rapidly in the last four years. The number of cattle slaughtered for the refrigerator-car trade in 1885 was 1,334,775. The entire annual value of manufactured products has risen from \$150,000,000 to \$370,000,000. The following table shows the advance in the quantity of the receipts of some leading articles of trade:

ARTICLES.	RECEIPTS.	
	1875.	1885.
Flour, barrels.....	2,625,888	5,985,722
Wheat, bushels.....	24,206,370	18,909,717
Corn, bushels.....	28,341,150	62,980,597
Oats, bushels.....	12,916,428	87,675,758
Rye, bushels.....	699,583	1,892,760

Hogs, number.....	8,912,110	6,970,255

Cincinnati, the chief city of Ohio, capital of Hamilton County, on the north bank of the Ohio river, 466 miles below its head at Pittsburg, 500 miles above its mouth, and 390 miles (direct) west of Washington; latitude 39° 6' north, longitude 84° 27' west. The population in 1870 was 216,239, of whom 79,612 were foreigners; in 1880 it was 255,189, of whom 71,659 were foreigners. The public schools had 28,999 pupils in 1875, and in 1885, 36,301 besides an average attendance in night-schools of 2,009. There are also more than 100 Roman Catholic parochial schools. There are at present 8 medical colleges, a law-school is maintained by Cincinnati College, and an art-school amply endowed is connected with the Cincinnati Museum. A college of music with a fine endowment has also been established, and has a fine building. The Public Library has grown in ten years from 62,000 to 148,000 volumes, and that of the Young Men's Mercantile Library Association from 35,500 to 50,000. The number of daily papers has increased from 8 to 14, and of weekly from 37 to 65; and there are 190 churches to the 160 of ten years ago. A third railroad-pier bridge across the

Ohio is under contract, and 24 lines of railroad radiate from the city, while ten years since there were but 15. There were 6 national banks, with an aggregate capital of \$4,400,000, and 17 private banks and banking-houses, with a capital of \$2,385,000. There are now 13 national banks, capital \$9,600,000, and 7 private banks, capital \$1,513,000. The assessed value of property in 1875 was \$184,498,565; in 1885 it was \$170,086,968. The disbursements of the city government in 1875 were \$3,865,274, including interest which amounted to \$900,566; the revenue, \$4,186,570; the bonded debt, Jan. 1, 1876, was \$17,325,500. In 1885, the disbursements were \$5,047,858.90, including interest, \$1,694,956.23; the revenue was \$5,866,524.33; the bonded debt, Oct. 1, 1886, was \$25,940,707.25. The following table shows the value of some important manufactured products in 1875 and 1885:

PRODUCTS.	VALUE.	
	1875.	1885.
Iron	\$16,088,835	\$9,919,260
Leather	7,570,175	4,268,590
Boots and shoes		6,328,912
Soap, candles, and oils	9,919,143	10,263,000
Liquors	23,040,267	29,468,071
Paper	2,213,887	5,154,440
Printing and publishing	6,200,454	5,114,060
Tobacco	4,198,177	9,367,750
Carriages, etc.	2,128,262	9,161,492
Clothing	18,896,900	17,169,111

In 1875 about 61,000 hands were employed; in 1885, about 91,000. The table below gives statistics of the receipts of important articles:

ARTICLES.	RECEIPTS.	
	1874-'5.	1884-'5.
Iron and steel	\$6,882,214	\$12,499,317
Leather	1,527,518	1,402,082
Lumber	2,019,350	4,950,500
Sheep	1,299,880	2,020,512
Sugar	5,828,385	4,671,658
Tobacco	14,116,740	15,049,900
Whisky	19,388,074	12,371,377
Coal	3,185,127	4,495,548

Clarksville, the capital of Montgomery County, Tenn., 40 miles northwest of Nashville, on the north side of the Cumberland river, at the mouth of Red creek, the head of navigation in the dry season. It is on the Louisville and Nashville system of railway, and is now the southern terminus of the Indiana, Alabama, and Texas Railway, a projected road from Evansville, Ind., to Birmingham, Ala. The population is 8,000. It is the seat of the Southwestern Presbyterian University. There are also three seminaries for girls, and a system of public schools. There are street-railways, a system of water-works, and gas and electric lights. A small amount of manufacturing is done, but the city is noted as a great tobacco-market. It is in the center of that part of Kentucky and Tennessee known as "the Clarksville tobacco-district." In the sale of natural leaf it ranks as the second tobacco-

market in the world, and the first in the sale and shipment of export tobacco. There are seven large warehouses for the sale, and six stemmerys where the leaf is made into strips for direct shipment to European ports. These establishments will handle about 90,000,000 pounds the present year. The Tobacco Exchange is one of the finest buildings in the State.

Cleveland, a port of entry and the capital of Cuyahoga County, Ohio, the second city in size and importance in the State, on the southern shore of Lake Erie, at the mouth of Cuyahoga river, latitude $41^{\circ} 30'$ north, longitude $81^{\circ} 46'$ west, 120 miles northeast of Columbus, 225 miles northeast of Cincinnati, and 170 miles southwest of Buffalo. The population in 1870 was 92,829, of whom 38,815 were foreigners; in 1880 it was 160,146. The police census of 1886 shows a population of 214,013, while the directory canvass for the same year, which takes in the suburbs, the census being confined to the corporate limits, places the number at 238,953. The present entrance to the river has been extended by two piers 200 feet apart, stretching several hundred feet into the lake. A breakwater, just west of the river's mouth, the cost of which was \$1,200,000, incloses 180 acres of water. This is to be extended eastward of the entrance to the river. There are 34 improved public docks, with a frontage of 2,415 feet and 82 unimproved public docks, with a frontage of 2,071 feet. The river and the two runs flowing into it, are crossed by 9 city swing- or draw-bridges, 10 railroad swing- or draw-bridges, and 40 stationary bridges, city and railroad. The most important of these is the Viaduct, 3,211 feet long, begun in 1874 and finished in 1878, at a cost of \$2,250,000. In 1886 was begun the Central Viaduct, 2,838 feet long. Another is to be built, 1,092 feet long, over Walworth Run, to the west side of the city, making altogether a belt elevated roadway, connecting the three divisions of the city. Still another elevated roadway, finished in 1886, is the Kingsbury Run Viaduct, 835 feet long. The total area of the city parks is 93 acres, and plans are under consideration for additional parks. In Lake View Cemetery, on Euclid Avenue, a monument has been built to President Garfield. Adelbert College, of Western Reserve University, was removed to Cleveland from Hudson, O., in 1882, on a conditional gift of \$500,000 from Amasa Stone, one of the conditions being the adoption of the name Adelbert, that of his dead son. It occupies an elevated position on Euclid Avenue, near the fine building of the Case School of Applied Science, founded on a bequest by Leonard Case, Jr., of landed property valued at \$1,250,000, which, by increase in value and subsequent bequests, has risen to an estimated value of over \$1,500,000. The Cleveland Manual Training-School was built and equipped in 1886 by a corporation of

business men. The Cleveland Medical College is a large and handsome brown-stone building, built in 1885 at a cost of \$150,000, the gift of J. L. Woods, on the site of the old building. The number of volumes in the Public Library has increased in about ten years from 24,000 to 48,000. The Case Library has 20,000 volumes. The number of churches has increased from about 125 to 150. Two new theatres were built in 1886, 10 or more railroad lines enter the city, and 13 regular lines of steamers connect Cleveland with other ports on the Great Lakes. Five of the lines of railroad lead directly to the bituminous coal-fields of the State. In 1876 there were six national banks, with an aggregate capital of \$4,550,000; there are now nine, with capital of \$6,581,700. There are 19 banks in all, and the total banking capital is about \$20,000,000. There were about 20 newspapers published, 5 with daily editions. There are now 8 daily, 3 tri-weekly, 47 weekly, and 28 monthly and quarterly publications. The receipts of bituminous coal amount to about 2,000,000 tons annually, more than one fourth of which is shipped to lake-ports, and about 120,000 tons of anthracite are brought from Pennsylvania. About 1,000,000 tons of iron-ore, mostly from Lake Superior mines, is received annually, and about 80,000 tons of pig-iron. There are 150 establishments manufacturing iron and steel in some form, employing about 18,000 persons, the capital invested being \$22,000,000, and the annual product about \$35,000,000. In 1876 the value of all manufactured products was placed at \$25,000,000 or \$30,000,000. The annual receipts of lumber average 350,000,000 feet. There are 20 oil-works, including those of the Standard Oil Company, whose headquarters are in Cleveland. There are five ship-yards for the manufacture of wood and steel vessels, and the city has a larger amount of tonnage registered than any other port on the lakes.

Columbus, a city, capital of Ohio and of Franklin County, on the Scioto river just below the mouth of the Olentangy, in the center of the State, 120 miles by rail northeast of Cincinnati, at the intersection of the 40th parallel and the 83d meridian. The population in 1870 was 31,244; in 1880 it was 51,647 and in 1886, estimated by the school census, it was 76,000. Fifteen railroads enter the city. A Government Building for court-rooms, post-office, and other Government offices, is in process of erection, the appropriations for it already exceed \$300,000. The State Agricultural Society has recently purchased nearly 100 acres within the city limits which it is laying out for fair-grounds and upon which permanent exhibition buildings are in process of erection. There are now two medical colleges and an art-school. The manufactures of the city are increasing. Prominent among them are the iron and steel manufactures, and those of agricultural implements and buggies.

Covington, a city, one of the seats of justice of Kenton County, Ky., and the second city in the State, is situated on the Ohio river, opposite Cincinnati, and immediately below the mouth of the Licking, which separates it from Newport. The population in 1875 was 24,505; in 1880 it was 29,720; and Jan. 1, 1886, it was estimated at 34,872. The Chesapeake and Ohio Railroad Company has begun building a bridge over the Ohio river at Covington, which will give it a continuous route from Newport News to Cincinnati. The Elizabethtown, Maysville, and Big Sandy Railroad Company has begun a track from Ashland, connecting with the Chesapeake and Ohio, with the intention of bridging the Licking at Newport, and passing through Covington to Cincinnati. The present Holly system of water-works by which water is pumped from the river in front of the city, is to be abandoned; the citizens have voted to issue \$600,000 of bonds for the purpose of building works and a reservoir about nine miles up the river in order to secure purer water. Fine fair-grounds have been laid out near the city, which has also a new post-office and a new jail. Street-railways connect the city with Cincinnati over the long wire suspension-bridge, and with Newport over the truss-bridge. There are in the city five banks with an aggregate capital of \$2,200,000, three newspapers, 32 churches, and 8 public, 12 Catholic parochial, and many private schools. The taxable property is assessed at \$15,646,525. Among the manufactories are 2 rolling-mills, 14 tobacco-factories, 48 cigar-factories, 15 carriage and wagon factories, 3 breweries, 6 distilleries, and glass-works.

Dayton, a city, and the capital of Montgomery County, Ohio, on Great Miami river at the mouth of Mad river, 60 miles by rail north-northeast of Cincinnati; latitude 39° 44' north, longitude 84° 11' west. The population in 1875 was 30,473; it is now 45,000. The capital invested in manufacturing business amounts to \$8,000,000, and 10,000 hands are employed, with a product of \$15,000,000 per annum, chiefly in railway-cars, bridges, mill-machinery, farm-implements, and the products of many paper-, oil-, and grain-mills, foundries, machine-shops, wood-working establishments, and 300 other shops. In addition to the water-power formerly sufficient for manufacturing purposes, steam is now largely employed. There are five national banks and one savings-bank, with an aggregate capital of \$1,600,000; the banking resources are \$5,600,000; eight insurance companies have paid-up capital amounting to \$1,200,000. Seven railways with their branches have stations in the city, besides the three steam-roads to the Soldiers' Home, and there are four street-railroads. The two rivers, Wolf creek, and the Miami Canal are spanned by iron and stone bridges. There are fifteen public schools, with an average daily attendance of 7,600, and parochial

and private schools have 2,100 more. Four daily and 22 weekly newspapers are issued from offices in the city and there are about 60 churches, a library building, a court-house, a jail, and five large market-houses. A State Insane Asylum is located one mile south of the city, and the National Soldiers' Home, with 5,000 inmates, occupies about 640 acres of land four miles west.

Denver, the chief city of Colorado, capital of the State and of Arapahoe County, on South Platte river, 15 miles east of the foot-hills of the Rocky mountains, and 5,203 feet above the level of the sea; latitude $39^{\circ} 44'$ north, longitude $105^{\circ} 4'$ west. In 1858 the place was uninhabited; in 1870, the population was 4,759; in 1880, 35,629; in 1885, 54,308; and in 1886 it was estimated at 75,000. The rapid growth of the city, as well as of the State, is largely due to the immense mineral resources of the region. It is, besides, a resort for invalids, the climate being especially beneficial in pulmonary diseases. The city is substantially and handsomely built. The Opera-House block cost about \$800,000, and the Court-House \$350,000. Appropriations for the Custom-House and Post-Office, now in process of erection, amount to \$750,000. Foundations are just laid for a State Capitol, for which \$1,000,000 have been appropriated. Other buildings, the cost of which is estimated at more than \$3,000,000, are now in progress. There are six national and several private banks, a United States Mint, numerous churches, and seven public schools. Many of the artesian wells afford mineral water, notably the Court-House well, 933 feet in depth. Six railway lines connect the city with other parts of the continent. The commercial, manufacturing, and cattle interests are rapidly advancing. There are four immense smelting establishments. The Denver, South Park, and Pacific Railroad connects the city with Leadville, another city of remarkably rapid growth, situated in a great mining district. It is but ten years of age, and has a population of 10,925. The product from its silver-mines amounted in one year to about \$10,000,000, and the mining products of two smelters in Denver to \$12,000,000.

Des Moines, a city and the capital of Iowa, in Polk County, at the head of steam navigation on Des Moines river, at its junction with the Raccoon, 357 miles by rail west of Chicago; latitude $41^{\circ} 35'$ north, longitude $93^{\circ} 40'$ west. The population, in 1875, was 14,443; in 1880, 22,408; in 1885, 32,469. The daily papers have increased from three to five, the weekly or monthly publications from 7 to 26, the 20 churches to 45. Water-works were constructed in 1871. The public district and high-schools, Drake University, Des Moines University, and Callanau College for young ladies, furnish facilities for education, and there are a City, Public, and a State Library. Fifteen railroads or branches have stations in the city. Coal abounds in the vicinity, and mining and

manufacturing are largely carried on, the mines alone employing about 2,000 persons. Among the manufacturing establishments are starch and glass factories, and a very large distillery. Pork-packing is also an important industry.

Detroit, a port of entry and the chief city of Michigan, capital of Wayne County, on the northwestern side of Detroit river, about 20 miles from Lake Erie, 7 miles from Lake St. Clair, and 250 miles east by north of Chicago; latitude $42^{\circ} 20'$ north, longitude $82^{\circ} 3'$ west. The population, in 1870, was 79,577, including 35,381 foreigners; in 1880, it was 116,340, of whom 45,645 were foreigners; in 1886, it was estimated at 219,192. Considerable territory was added to the city, in 1885, by the annexation of suburbs. Twelve railroads center in the city, and steamers run to all the lake-ports. Warehouses, factories, and other business buildings line almost the entire river-front of seven miles. A bridge, to cost \$300,000, is in process of construction, to connect with the city the principal park, Belle Isle, on an island in the middle of the Detroit river, containing about 700 acres. A boulevard, partly finished, is designed to form a crescent, 9 miles long and 150 feet wide, leading from this bridge around the city. An appropriation has been made and land bought for a Government building, to cost \$1,000,000. The total value of new buildings erected in 1885 was \$3,103,873. The assessed valuation of the city, July 1, 1886, was \$133,448,580; the net debt, \$36,490. The number of daily newspapers is eight, the same as it was ten years ago, but the other periodicals published have increased from about 12 to 46, the churches from 75 to 139. There are 92 schools and colleges, with 30,296 pupils. Ten years ago the public schools had about 13,000 pupils. The foreign commerce is mostly with Canada. The following table shows the increase in trade:

ITEMS.	For the year ending June 30, 1875.	For the year ending Sept. 30, 1886.
Imports	\$1,329,826	\$3,070,849
Exports.....	\$2,851,766	\$4,283,810
		For the year ending Dec. 31, 1885.
Entrances.....	4,197	5,390
Tonnage of entrances.....	973,886	1,014,749
Clearances.....	4,166	5,400
Tonnage of clearances.....	972,475	1,022,977
Vessels enrolled in the district	852	298
Tonnage of same.....	83,505	98,889

In the latter year the receipts of grain were 13,059,032 bushels; the shipments, 9,309,319 bushels; 346,718 loaded cars crossed Detroit river, having an estimated tonnage of 4,160,616. The capital employed in the iron industry has increased in about ten years from \$4,000,000 to \$5,000,000. Detroit is the largest center in the world for the following manufacturers: Railroad-cars, annual product, \$6,000,000 to \$7,000,000; stoves, annual product, \$2,500,000; pharmaceutical supplies; and emery-wheels. Tobacco is largely manufact-

ured, and there are also saw-mills, flour-mills, breweries, distilleries, malt-houses, brick-yards, tanneries, copper-smelting works, and other important industries.

Dubuque, a city and port of delivery, capital of Dubuque County, Iowa, on the Mississippi river, opposite the boundary-line between Illinois and Wisconsin, 440 miles by river above St. Louis, and 185 miles by rail west-northwest of Chicago. The population in 1880 was 22,254; in 1885, 26,330. An inclined-plane cable-railway has been built to one of the bluffs, on which some of the finest dwellings are situated. A new bridge is now in process of construction, to be 76 feet above low-water mark and 2,000 feet long, and to cost \$125,000. Public schools, including a high-school, are maintained at an annual cost of \$55,000. Water is supplied by water-works and artesian wells. The railroad and lumber companies recently expended several hundred thousand dollars for reclaiming low lands and sloughs. Communication is furnished by five railroads, two of them lately built. The Chicago, Milwaukee, and St. Paul Railway has shops at Dubuque. The mining industry, once so important, has declined, the value of the lead-ore for 1885 having been but \$16,000, and of the zinc-ore \$12,000. Formerly from \$500,000 to \$1,000,000 worth of lead was shipped annually. The grain-trade is large, and a great part of the wealth of the city has of late years been invested in manufactures. Steel steamers are made at the Iowa Iron-Works. The value of manufactures in 1885 amounted to \$10,737,300; the business of the jobbing trade to \$16,196,500; the retail sales to \$9,729,500; and the value of other activities to \$6,962,758.

Duluth, a port of entry, the capital of St. Louis County, Minn., at the southwestern extremity of Lake Superior, and at the mouth of St. Louis river, 155 miles by rail north-northeast of St. Paul. It was founded in 1856, but had in 1875 a population of only 2,953; in 1886 the population was estimated at 26,469. In 1856 a steam saw-mill and a blacksmith-shop were built; in 1858 the United States Land-Office was located there; in 1872 the customs district was organized. The financial crisis of 1873 retarded the growth of the place, but in 1878, through the development of the lumber interests and its inauguration as a distributing point, its prosperity was renewed. As a result of the panic the city became insolvent and took the form of a village. The place has a fine natural harbor, with an average width of $1\frac{1}{2}$ mile, formed by two points of land 7 miles long, extending into the lake—Minnesota Point and Rice's Point. Besides the natural entrance, the "Entry," a canal has been cut through at an expense of \$200,000. The Government protects navigation by two light-houses and a fog-horn, and the Forty-ninth Congress appropriated \$56,250 for the improvement and enlargement of the basin in

the harbor between Minnesota and Rice's Points. Authority has also been granted for a life-saving station. Superior City, Wis., lies along the border 4 miles northward, bounded on the Minnesota side by Rice's Point. Between the two points is the flat on which the docks are built, laid out in blocks with railroad-tracks between. In the rear are elevators for coal and wheat. In 1885, nine lake transportation companies were represented, with 3,501 entrances and 1,200,000 tonnage. Fully 50 per cent, may be added for 1886. Improvements made on the slips during 1886 by railroad companies, other corporations and individuals, amount to \$1,500,000. More than 41,000 piles have been driven. The docks built and improved have cost, including the dredging, \$2,200,000. Ten passenger steamers ply between this port and Buffalo, four running to Chicago, three to Sarnia, and three to Collingwood, carrying from 100 to 250 cabin passengers each. The run from Duluth to Buffalo is made in five days. A cold-storage warehouse stores more than 500 dressed cattle, not including sheep and hogs, and the slaughter-houses have a capacity of 100 cattle per day; 4,000 cattle were handled during the season of 1886. The value of exports during the months of May and June, 1886, was \$649,800, and of imports, \$47,306. More than 2,500,000 tons of iron-ore were shipped from Lake Superior mines in the season of 1886, the gross gain over the shipments of 1885 being 1,000,000. Shipments of flour, sheep, wool, hides, copper and silver ore, and bullion reached 43,000 tons in one week. Salmon packed near Victoria on Vancouver Island is brought here by rail and shipped by propeller to Toronto. Following shows receipts and shipments of some articles:

ARTICLES.	Receipts.	Shipments.
Steel rails, tons, 1886.....	100,000	
Flour, barrels, 1886.....		1,500,000
Wheat, bushels, 1886.....	25,000,000	
Lumber, feet, 1885 (east).....		40,000,000
Lumber, sales in 1885.....		78,000,000
Coal, tons, 1885.....	600,000	
Coal, tons, 1886.....		700,000

The amount of flour handled in 1886 was more than three times the amount of the previous year. The wheat shipped during May, 1886, was 2,903,697 bushels against 1,562,000 in May, 1885. The freight bills for wheat arriving in one day over one line of railroad aggregate \$25,000. There are eleven elevators and warehouses, and contracts have been drawn for five more. In 1885-'86 the railroad companies expended over \$3,500,000 in improvements, and other improvements raised the sum to nearly \$6,000,000. Four railroads now enter Duluth, and two others are in process of construction. There are nine lumber-mills having a capacity of 170,000,000 feet. There are vast forests of pine and black or yellow birch and basswood in the country tributary to Duluth. The mills and lumber-

yards occupy half a mile square at the west end. The fishing interests employ 175 men, 1 steamer, 6 tugs, and 50 sail-boats. The catch averages 12 to 16 tons a week. The following are the figures for 1885: White-fish, 506,826 pounds; trout, 1,258,452 pounds; other fish, 125,000 pounds; total, 1,890,278 pounds; value, \$121,186.50.

The Forty-ninth Congress appropriated \$10,000 for a fish-hatchery. In the spring of 1886, 15,000,000 lake-trout from the hatcheries of St. Paul were planted in the fishing waters along the north shore to Pigeon river and along the south shore to Apostle Islands. The principal manufactures are iron products, lumber, wood-work, brick, soap, brooms, and there are some minor industries. One lime-kiln company has three kilns, making 250 barrels of lime daily. An iron company controlling 1,000 laborers in the mines has headquarters here. The bank transactions in 1885 amounted to \$288,267,857, an increase of \$132,000,000 over the previous year. There are four banks, two of them national, with capital of \$712,000 and deposits \$1,200,000. The postal revenue for the last year was \$26,000. Quarries of granite, slate, trap, and sand-stone are worked in the vicinity, and mines of amethyst yield stones of great size and brilliancy. There are sixteen churches, seven public schools, a fine opera house and a court-house, a fire department, electric lights, water-works, and a street-railway. The Board of Trade has a fine building. Five hundred buildings were erected during the first half of 1886. There are four daily and three weekly newspapers, a semi-weekly and a monthly publication.

Elizabeth, a city and the capital of Union County, N. J., on Newark Bay and Staten Island Sound, 11 miles by rail west-southwest of New York. Latitude, $40^{\circ} 40'$ north; longitude, $74^{\circ} 13'$ west. The population in 1870 was 20,832; in 1875, 25,923; in 1880, 28,229; in 1886 it was estimated at upward of 30,000. More than eighty passenger-trains are run to New York daily. The total valuation of property in 1880 was \$11,540,835. A large business in coal-shipping is done at the port. The most prominent business enterprise is that of the Singer Sewing-Machine Company, in which an average of about 1,500 hands are employed. Capital to the amount of \$105,000 was employed in 1880 in the manufacture of other foundry and machine-shop products, the total value of which was \$248,000. The entire amount of capital invested at that time in manufactures was \$2,453,180; the number of employés, 3,849; and the value of products, \$6,828,027.

Elmira, a city and the capital of Chemung County, N. Y., on both sides of the Chemung river, 273 miles west-northwest of New York. Latitude, $42^{\circ} 5'$ north; longitude, $76^{\circ} 50'$ west. The population was 15,863 in 1870; 20,541 in 1880; 21,814 in 1886; including, however, the

territory not included within the corporate limits but covered by the mail delivery, it has about 25,000. Six railroads touch the city, and there are three large car-shops located there. New manufacturing enterprises of importance are the La France Steam-Fire Engine and the Hay's Truck and Ladder establishments, and the Payne Manufactory of Boilers, Steam-Engines, etc. The value of boots and shoes produced in 1880 was \$760,425; of tanned leather, \$540,600; of planed lumber, \$207,900; and of men's clothing, \$260,250. The entire amount of capital invested in manufactures was \$2,698,762; the number of hands employed, 2,728; and the value of products, \$4,877,300.

Fall River, a city and port of entry of Bristol County, Mass., on Mount Hope Bay, an arm of Narragansett Bay, at the mouth of Taunton river, 49 miles by rail south by west of Boston; latitude $41^{\circ} 43'$ north, longitude $71^{\circ} 9'$ west. The population in 1870 was 26,766; in 1880, 48,961; in 1886, 59,021. Three railroads touch the city, and horse-car tracks are laid in the principal streets. A new custom-house and post-office building has recently been erected, and a fine high-school building is approaching completion. The coastwise trade of the city is considerable. In 1880, 20 vessels in foreign trade were entered and 17 cleared; 732 in coastwise trade, with tonnage of 1,183,743, were entered and 683 cleared; vessels enrolled in the district, 124. Steam has been largely substituted for water-power in the mills, which now run 1,770,764 spindles and 41,506 looms. The amount of capital employed in cotton-manufacture in 1880 was \$22,707,043, and the value of the product \$14,510,007. The whole amount of capital invested in manufacturing at that time was \$25,076,518, the number of employés 17,085, and the value of products \$18,913,584.

Galveston, a city and port of entry, capital of Galveston County, Texas, the chief city of the State in population and commerce, on the northeastern extremity of Galveston Island, at the mouth of Galveston Bay, 214 miles by rail east-southeast of Austin; latitude $29^{\circ} 19'$ north, longitude $94^{\circ} 46'$ west. The population in 1870 was 13,818; in 1880, 22,248; in 1886 it is estimated at 42,000. It has nine public schools with 80 teachers, 4,000 pupils, and \$215,500 worth of school property. The value of taxable property in the city is \$22,000,000. Galveston is entered by the Gulf, Colorado, and Santa Fé, and the Galveston, Houston, and Henderson Railroads, and has a street-railroad service. There are two lines of steamships plying between it and New York city. In 1885, 215 transient steam-vessels and 211 sail-vessels, with tonnage of 356,596, were employed in trade to European and North and South American ports, while the home fleet consisted of 146 sail, 32 steam, and 5 unrigged vessels, with tonnage of 7,148. Ten years ago there were two national banks; there are

now five, besides six private banks and banking-houses; capital, \$2,100,000; dealings in exchange in 1885, \$56,900,000. A new custom-house is in process of erection. There are five cotton-presses with 13 storage-yards built of brick, with a capacity of 140,000 bales; power of compress, 6,000 bales per day; aggregate capital, \$1,100,000. There are 47 firms in the wholesale trade, with an aggregate capital of \$12,000,000, whose sales for 1885 amounted to more than \$29,000,000. The Galveston Oil-Mills have a capital of \$300,000, and the Texas Star Flouring-Mill \$100,000. Another flouring-mill is in process of erection, with a capital of \$1,000,000. The value of exports to foreign ports in 1874-75 was \$15,876,632; in 1885, \$16,531,766. The chief business is the shipment of cotton.

Harrisburg, a city, capital of Pennsylvania and of Dauphin County, on the east bank of the Susquehanna river, 105 miles by rail west by north of Philadelphia; latitude $40^{\circ} 16'$ north, longitude $76^{\circ} 53'$ west. The population in 1870 was 23,104; in 1880 it was 30,762; in 1886, estimated at 40,000. The South Pennsylvania Railway Company is now building a new railroad-bridge over the river. Two great railway systems intersect at Harrisburg, the Pennsylvania, Philadelphia, and Reading, and the Cumberland Valley, while the Northern Central connects it with Baltimore and with the North. The manufacture of iron and steel is extensive. In 1880 the capital employed in that industry was \$2,021,692, with a product worth \$2,839,500. Steelton, an adjoining suburb, is the seat of the Pennsylvania Steel-Works. The capital invested in the manufacture of planed lumber the same year was \$205,000, the product \$110,019; in printing and publishing \$172,550, product \$465,920; in foundry and machine-shops \$145,000, product \$174,000. The total capital of all establishments was \$4,026,457; the number of hands, 3,660; the total product, \$7,663,416.

Hartford, a city, capital of Connecticut and of Hartford County, on the west bank of the Connecticut river, at the head of sloop navigation, 50 miles by the river from Long Island Sound, 110 miles by rail northeast of New York, and 114 miles west-southwest of Boston; latitude $41^{\circ} 46'$ north, longitude $72^{\circ} 41'$ west. The population in 1870 was 37,180; in 1880, 42,015; it is now estimated at 45,000. A new high-school building was erected in 1884. The Soldiers' and Sailors' Memorial Arch, standing at the entrance to the Capitol-grounds, was dedicated in 1886. The library of the Connecticut Historical Society has increased in ten years from 16,000 volumes to 23,000, and the Watkinson from 27,000 volumes to 36,600. There are in all 23 libraries in the city, containing 277,765 volumes. The number of pupils enrolled in the public schools has risen from 7,000 to 10,000. The capital invested in fire-insurance companies has increased from \$6,400,000 to \$10,000,000, and that in life and

accident insurance companies from \$100,000,-000 to \$150,000,000. The following table shows the value of the most important industries in 1880:

MANUFACTURES.	Capital.	Value of products.
Foundry and machine-shop products .	\$1,007,000	\$821,705
Clothing, men's.....	112,686	657,212
Printing and publishing.....	929,700	518,600
Flouring- and grist-mill products.....	122,000	405,296
Boots and shoes.....	142,300	369,100
Saddlery and harness.....	47,575	306,589
Plated and britannia ware.....	63,500	227,175

The entire amount of capital invested in manufacturing was \$9,679,126, the number of hands employed was 6,300, and the total value of products \$11,437,200.

Hoboken, a city of Hudson County, N. J., on the Hudson river, opposite New York, joining Jersey City on the northeast; latitude $40^{\circ} 44'$ north, longitude $74^{\circ} 1'$ west. The population was 20,297 in 1870; in 1880 it was 30,999; it is now estimated at 39,000. Hoboken is the terminus of the Delaware and Lackawanna Railway and of four lines of European steamships. An elevated traction-cable road from the ferries to Jersey City Heights began operating in 1886, and a new ferry to Fourteenth Street, New York, was completed the same year. A large city hall was built in 1881, and a new opera-house in 1886. There are now 8 public schools, including a high, a normal, and an evening school, with an enrollment of 5,415, and 2 newspapers. The capital employed in foundries and machine-shops in 1880 was \$123,000, and the value of products \$141,056; in the manufacture of silk and silk goods a capital of \$74,300 was employed, and the value of the product was \$101,000. The entire amount of capital invested in manufactures was \$486,320, the number of hands employed 723, and the value of products \$1,051,136.

Holyoke, a city of Hampden County, Mass., on the west bank of the Connecticut river, 8 miles by rail north of Springfield, 11 miles by rail northeast of Westfield; latitude $42^{\circ} 12'$ north, longitude $72^{\circ} 36'$ west. The population in 1870 was 10,733; in 1880, 21,915; in 1885, 27,895. Nearly one half of the population is foreign-born. Its water-power, derived from a fall of 60 feet in the Connecticut river, is equal to 30,000 horse-power. The Connecticut River Railroad passes through, and a branch connects it with the New Haven and Northampton. The City Hall, built of granite, cost \$400,000. There are 4 national banks, 3 savings-banks, 10 churches, an opera-house, 1 daily, 4 weekly, and 4 monthly newspapers, and 12 public schools. The largest manufacturing industry is that of paper, more fine writing and envelope papers being made here than in any other city in the country. The largest blank-book works in the country also are located here. The average daily product of paper is 200 tons. Following are the statistics of the principal industries in 1880:

MANUFACTURES.	Capital.	Value of products.
Paper.....	\$3,476,979	\$4,610,947
Cotton goods.....	2,810,000	3,056,851
Woolen goods.....	895,794	899,851
Foundry and machine-shop products.....	282,500	521,592

The whole amount of capital invested in manufacturing was \$8,913,903, the number of hands 9,011, and the value of products \$13,667,327.

Jersey City, a city, the capital of Hudson County, N. J., on the west bank of Hudson river at its entrance into New York Bay, opposite the city of New York; latitude $40^{\circ} 43'$ north, longitude $74^{\circ} 1'$ west. The population in 1870 was 82,546; in 1880, 120,722; in 1885, 155,300. Thirteen railroads enter the city, and it is the terminus for the Inman, Red Star, Monarch, and Netherlands lines of steamships. There are three national and many savings banks. As the city forms a part of the New York customs district, its commerce is not separately returned. The statistics of the most important manufacturing industries in 1880 were as follow:

MANUFACTURES.	Capital.	Value of products.
Sugar and molasses, refined.....	\$2,100,000	\$22,799,614
Slaughtering and meat-packing.....	1,272,200	18,551,783
Drugs and chemicals.....	563,000	1,517,214
Iron and steel.....	850,000	1,446,500
Foundry and machine-shop products.....	768,300	1,041,471
Cooperage.....	167,700	630,529
Ship-building.....	263,500	541,766
Bread and other bakery products.....	75,150	459,888
Liquors, malt.....	856,500	416,886

The entire amount invested in manufacturing in that year was \$11,899,915, the number of employés 11,138, the total value of products \$60,473,905.

Kansas City, a city of Jackson County, Mo., the second in the State in population and importance, on the right bank of the Missouri river, near the mouth of the Kansas, and close to the Kansas border. It is 283 miles by rail west by north of St. Louis, and 135 miles west-northwest of Jefferson City. The population in 1870 was 32,260; in 1880 it was 55,787; and in 1885 was estimated at 105,042. This does not include the population of the suburbs across the river, which have this year been organized under the name of Kansas City, Kansas, and virtually form a part of the city. The total population is 128,477. The assessed valuation of property has risen from \$13,378,950 in 1880 to \$46,886,790 in 1886; the rate of taxation has fallen from 25 mills to 15; and the city indebtedness from \$1,430,219 in 1872 to \$965,000 in 1885. The number of building permits has increased from 741 in 1880 at a valuation of \$1,813,841 to 2,914 in 1885 at a valuation of \$5,758,629. The real-estate transfers amounted to \$5,461,250 in 1880, and to \$17,745,750 in 1885. The following table will serve to show further the advance from 1880 to 1885:

TRANSACTIONS.	1880.	1885.
Real-estate transfers.....	\$5,461,250	\$17,745,750
Internal-revenue receipts.....	\$253,929 25	\$961,298 24
Post-office receipts.....	\$123,753 09	\$238,562 95
Cattle received.....	244,709	506,627
Hogs received.....	676,477	2,358,718
Sheep received.....	50,611	221,801
Horses and mules received.....	14,086	24,506
Cattle slaughtered and packed.....	80,922	78,963
Hogs slaughtered and packed.....	539,097	1,529,415
Sheep slaughtered and packed.....	...	32,915
Bushels of wheat received.....	4,093,528	4,763,844
Bushels of corn received.....	4,421,700	7,894,584
Bushels of oats received.....	366,456	881,867
Tons of coal received.....	820,897	583,282

The clearing-house was organized in 1875, and clearances show a gradual growth of trade from \$20,407,967 of that year to \$223,582,933 of 1885. There are 18 public schools and four more in process of erection. There are about 60 churches, three medical colleges, three hospitals, a Roman Catholic college for girls, and four libraries and reading-rooms. The six daily newspapers have increased to eight, and 31 other periodicals are published. There are water-works and four horse-car lines. One cable line is in operation and others are projected. An elevated road is in process of construction, running between the city and Wyandotte, a suburb. A new building for the Board of Trade, to cost \$300,000, is partly built, and a new hotel valued at \$700,000. There are 13 banks and two in process of organizing, with capital of \$1,000,000 and \$500,000, respectively. A large smelting establishment is located at Argentium. Thirty firms deal in farm implements, 30 in lumber, and 50 in grain. Fourteen lines of railroads enter the city, using a common depot, and three other roads are in process of construction.

Lancaster, a city, capital of Lancaster County, Pa., on the right bank of Conestoga creek, 12 miles from its junction with Susquehanna river, 68 miles by rail west of Philadelphia; latitude $40^{\circ} 3'$ north, longitude $76^{\circ} 21'$ west. The population in 1870 was 20,233; in 1880, 25,769; in 1886 it was estimated at 30,000. Lancaster is reached by the Pennsylvania Railroad and the Quarryville Branch of the Columbia and Reading. It is the site of a crematorium, the second completed in the United States. It is surrounded by one of the largest and most productive limestone regions of the State. The largest industry is the making of cotton goods. Following are statistics of the largest establishments for 1880:

MANUFACTURES.	Capital.	Value of products.
Cotton goods.....	\$1,882,000	\$1,654,182
Carriages and wagons.....	151,600	242,760
Tobacco, cigars, and cigarettes.....	125,720	236,435
Foundry and machine-shop products.....	184,650	225,623
Clothing, men's.....	121,265	214,875
Leather, tanned.....	66,400	178,128
Leather, curried.....	51,300	177,455
Liquors, malt.....	180,000	139,275

The entire amount invested in manufacturing was \$3,792,740, number of employés 4,252, and total value of products \$5,404,937.

Lawrence, a city, capital of Douglas County, Kansas, on both banks of the Kansas river, 40 miles above its mouth, 25 miles east by south of Topeka, and 28 miles southwest of Leavenworth. It was settled in 1854. The population in 1875 was 7,268; in 1886, 10,300. It is on the Union Pacific, the Atchison, Topeka, and Santa Fé, and the Southern Kansas Railroads. The State University and Haskell Institute, a Government Indian school, are located there. The city possesses good water-power, has five corn- and flour-mills, two machine-shops, and other manufacturing establishments.

Lawrence, a city and one of the shire towns of Essex County, Mass., on both sides of the Merrimack river, about 26 miles from its mouth, 26 miles by rail north of Boston, and nine miles below Lowell; latitude $42^{\circ} 42'$ north, longitude $71^{\circ} 9'$ west. The population in 1870 was 28,921; in 1880, 39,151, of which about 44 per cent. are of foreign birth. In 1845, there was not one dwelling on the ground now covered by the most populous part of the city. A dam was built across the river in that year, and in 1853 Lawrence received a city charter. The water-power afforded by the dam is estimated at about 10,000 horse-power. The Government has so improved the river below the city that barges and steamboats of light draught can reach the lower part of the city without difficulty. Four railroads afford communication with Boston and with the north. There are two daily papers and a street-railroad. The great water-power furnished by the fall of the river is utilized for manufactures, mainly of woolen, cotton, and worsted goods. Ten years ago it was reported as having eight cotton and woolen corporations, with an aggregate capital of \$7,590,000, about 360,000 spindles, 8,600 looms, and 11,000 operatives. In 1880 there were seven establishments for making cotton goods, three for woolen goods, five for worsted goods, and three for mixed textiles, in all 18, with an aggregate capital of \$15,232,285, and employing 13,218 hands, besides three for dyeing and finishing textiles, with a capital of \$1,645,000 and employing 1,311 hands. Capital to the amount of \$410,000 was employed in the manufacture of paper, and \$296,362 in that of foundry and machine-shop products. The entire capital of all establishments in 1880 was \$18,698,977, the whole number of employés 16,719, and the total value of products \$25,058,246. The value of the product of cotton, woolen, worsted, and mixed goods amounted to \$18,002,508.

Leavenworth, a city, the largest and oldest in Kansas, and the capital of Leavenworth County, on the right bank of Missouri river, 500 miles above its mouth, 25 miles northwest of Kansas City, Mo., and 45 miles northeast of Topeka. The population in 1875 was 15,136; in 1880, 16,546; in 1886 it was estimated at 30,431. A system of water-works has been completed, and several miles of the Waring

system of sewers are in use. A large Union depot, and a Government building for a court-house and post-office are in process of construction. The Southwestern Branch Soldiers' Home was placed at Leavenworth in 1884, and occupies 640 acres two miles south of the city. There are ten large buildings nearly completed, and others begun. Several hundred veterans have a home there. A school of application, for training young officers, has been established at Fort Leavenworth, two miles north of the city, and a United States military prison. A large river-trade was formerly carried on; but the carrying-trade is now almost monopolized by the railroads. The development of the bituminous coal-beds that underlie the city has given a strong impetus to manufacturing. The chief establishments are foundries, stove, boiler, machine, and brass works, planing- and flouring-mills, box, barrel, cigar, and furniture factories, and wagon, bridge, and glucose works. New elevators have been built to accommodate the increasing grain-trade. The apple-trade is very large, thousands of barrels being shipped every year.

Los Angeles, a city, capital of Los Angeles County, Cal., on the west side of Rio de los Angeles, which falls into San Pedro Bay, 350 miles south-southeast of San Francisco, and 300 miles south-southeast of Vallejo; latitude 34° north, longitude 118° west. The population in 1875 was 5,728; in 1880, 11,000; in 1886 it was estimated at 40,000. The assessed value of real and personal property has risen from \$5,947,580 in 1878 to \$16,273,535 in 1885. Several colonies have grown up within 20 miles of Los Angeles in the past fifteen years, many within five years. The wealth of the county increased from \$16,228,106 in 1878 to \$35,494,027 in 1885. The city is a railroad center, and a favorite winter resort for invalids.

Louisville, a port of delivery, the chief city of Kentucky, and capital of Jefferson County, on the south bank of Ohio river at the falls, about 400 miles above its mouth, and 600 miles below the head of navigation at Pittsburg, 150 miles below Cincinnati, and 45 miles west of Frankfort. The population in 1870 was 100,753; in 1880 it was 123,758; in 1886 it was 155,000, about one fifth of whom were colored. In 1870 there were 8 national banks, 15 or 20 State banks, 6 daily newspapers, several medical schools, 95 churches, and 3 public libraries, the State Library having 30,000 volumes, and a museum and natural history department with 100,000 specimens. There are now 9 national and 18 other banks with a capital of \$9,113,500, 5 daily and 32 other newspapers and journals, 32 school-buildings, 5 medical colleges, 128 churches, and 3 public libraries. Formerly the trade of the city was mainly by the river; but it now has ample railway facilities, besides several lines of freight and passenger steamboats running up as far as Pittsburg and down as far as New Orleans. An elevated railroad along the river-

front, two miles in length, connects the northern and southern lines of railway. Besides the bridge at the head of the falls, an iron railway, wagon, and foot bridge with stone piers crosses the river at Portland, the southwest suburb of the city, at the foot of the falls. The total value of property at the last assessment was \$62,763,461. The whole number of manufacturing establishments in 1870 was 783; the capital invested, \$11,119,000; the hands employed, 11,549. There are now nearly 1,300 establishments with \$22,000,000 capital and 22,000 hands, and production amounting to a value of \$50,000,000. The largest business is the trade in whisky. The manufacture of five distilleries in 1874 amounted to 1,037,644 gallons. The amount distilled in the Louisville district in 1884 was 15,511,000 gallons—in bond, the same year, 23,573,448 gallons. There are 75 wholesale liquor-houses. Four leading plow-factories produce annually 225,000 plows and 35,000 cultivators. The production of wagons is over 10,000 annually; the value of furniture made, \$1,500,000. In 1885, 900,000 barrels of hydraulic cement were manufactured. There are 12 tobacco-factories. Other important manufacturing products are those of architectural iron material, boilers, bridges, beer, and leather. Pork-packing is an important business, the sugar-curing of hams being a specialty. Large quantities of leaf-tobacco are exported to Europe and Canada.

Lowell, a city and one of the shire towns of Middlesex County, Mass., on the Merrimack river, at the mouth of the Concord, 26 miles by rail northwest of Boston; latitude $42^{\circ} 38'$ north, longitude $71^{\circ} 19'$ west. The population in 1870 was 40,928; in 1880 it was 59,475; in 1885, 64,107. Water-power equal to 14,000 horse-power is furnished by the two rivers. The number of pupils in the public schools has risen in ten years from 5,000 to 10,000, the number of daily newspapers from three to five, of churches from 30 to 36, the number of volumes in the City Library from 17,000 to 30,000, and of those in the Mechanics' Library from 13,000 to 16,000. Seven railroads enter the city. There are four parks, the largest of 22 acres. The manufacture of cotton goods is the most important industry. In 1880 capital to the amount of \$11,279,011 was invested in cotton-mills, \$1,975,509 in the manufacture of woolen goods, \$634,862 in that of worsted goods, and \$3,000,000 in establishments for dyeing and finishing textiles. The value of the product of cotton goods was \$19,510,955; of woolen goods, \$3,326,945; of worsted goods, \$1,367,320; and of the dyeing and finishing establishments, \$1,993,751. The foundries and machine-shops, with a capital of \$1,216,860, produced goods of the value of \$2,378,799. The entire capital of all establishments was \$20,465,192, the number of hands employed 20,039, and the total value of products \$33,935,777. The following table shows the advance from 1875 to 1885:

ITEMS.	1875.	1885.
Looms.....	15,159	28,234
Spindles.....	678,521	884,494
Hands employed.....	16,000	18,000
Yards of cotton goods made per week.....	2,660,000	4,882,000
Yards of carpeting made per week.....	37,500	60,000
Dozens of hosiery made per week.....	16,800	17,046
Yards dyed and printed per annum.....	64,951,200	82,483,960

The Lowell Machine-Shop, having at the former date a capital of \$600,000 and employing 1,100 hands, has now a capital of \$900,000 and employs 1,600 hands.

Lynn, a city of Essex County, Mass., on the north shore of Massachusetts Bay, ten miles northeast of Boston; latitude $42^{\circ} 27'$ north, $70^{\circ} 57'$ west. The population in 1870 was 28,233; in 1880, 38,274; in 1885, 45,861. The Government has recently made an appropriation for improving the harbor, which, though well protected, is shallow and not available for vessels of heavy draught. The work has been begun, the ultimate object being to divert the current of Saugus river to a new channel in the harbor, that it may act as a scourer. Lynn is entered by two railroads, and has a street-railway system, extending not only through the city but to outlying towns and cities, one line to Boston. The City Hall was erected at a cost of \$300,000; there are 72 schools, with 139 teachers; the school population is 7,527. Opposite the City Hall is a soldiers' monument, in bronze, cast in Munich from designs by Jackson; it cost \$30,000. The Public Library has more than 33,000 volumes. There are five national banks of discount, with an aggregate capital of \$1,100,000 and deposits amounting to \$1,750,000, and two savings-banks, with deposits of \$4,624,634. Five weekly and two daily papers are published. Work was begun in 1885 on a new system of sewerage. The largest park in the city is the Common, 7.25 acres. A movement is on foot to secure the forest-lands of northern Lynn, some 3,300 acres in extent, for a park. The great industry is the manufacture of shoes. The annual product of this trade is more than \$20,000,000. There are besides large morocco-factories, shoe-machinery factories, and last, pattern, and box factories. In 1880 the value of curried leather made was \$2,283,672, and that of tanned leather, \$1,669,087. Prominent among recently established industries is that of the Thomson-Houston Electric Company, manufacturing electric-dynamo machines, lamps, etc., and employing about 700 men.

Malden, a city of Middlesex County, Mass., on the Malden river, six miles north of Boston; latitude $42^{\circ} 26'$ north, longitude $71^{\circ} 4'$ west. It was originally a part of Charlestown, was granted an independent existence in 1649, and made a city in 1882. The population in 1870 was 7,370, in 1880, 12,017, and in 1885, 16,407. It is on the Boston and Maine and Eastern Railroads, has a horse-car line, water-works constructed in 1870, and had, in 1880, 11 schools with 50 teachers and an average at-

tendance of 1,825. The Converse Memorial Building, designed by H. H. Richardson, has been recently erected for the Public Library. The principal manufactory is that of the Boston Rubber-Shoe Company, one of the largest establishments of its kind in the country. The works are valued at \$377,400. Other manufactures are those of leather, sand-paper, emery-paper, lasts and boot-trees, wire and picture-cords, hose and twines. There are also establishments for dyeing silk and cotton fabrics.

Manchester, one of the shire towns of Hillsborough County, N. H., and the largest city in the State, on both sides of the Merrimack river, 18 miles south by east of Concord, 40 miles east by south of Portsmouth, and 55 miles northwest of Boston; latitude $42^{\circ} 59'$ north, longitude $71^{\circ} 28'$ west. The population was 23,536 in 1870, 32,630 in 1880, and 37,593 in 1884. The villages Amoskeag and Piscataquog, on the west side of the river, have now a village between them, built since 1880, connected with Manchester proper by an iron bridge. Four railroads, with their connections, give facilities for communication. There are a horse-railroad and five public parks, aggregating 20½ acres. A Government Building, to cost \$200,000, is about to be erected. The public schools have 76 teachers and 3,800 pupils. There are 18 churches, five national and five savings banks, two daily and three weekly newspapers, and a free library of 29,000 volumes. The State Industrial School is at Manchester. The growth and prosperity of the city are due to the water-power afforded by the Amoskeag Falls in the Merrimack, and applied principally to the manufacture of cotton and woolen goods. Steam-power is used in dry seasons. In 1880, capital to the amount of \$8,808,584 was invested in the manufacture of cotton goods alone. It yielded \$7,604,568 worth of products. Over 6,200 operatives were employed; \$354,000 was invested in foundries and machine-shops, the products were valued at \$717,851. The entire amount of capital invested in manufactures was \$15,149,153, the number of hands employed, 10,838, and the total value of products, \$14,136,305. Between the years 1874 and 1886 the number of looms increased from 7,654 to 13,435, the number of spindles from 303,600 to 441,100, the number of employés from 9,000 to 10,825, and the number of yards manufactured per week from 1,430,000 to 2,479,000. The Manchester Locomotive-Works, incorporated in 1854, had turned out 786 complete engines up to 1875.

Memphis, a city and port of delivery, capital of Shelby County, Tenn., and the largest city in the State. It is in the southwest corner of the State, on Mississippi river, just below the mouth of Wolf river, on the fourth Chickasaw bluff, about 35 feet above the highest water, 780 miles above New Orleans, 420 miles below St. Louis, and 232 miles by rail Southwest of Nashville. The population in 1880 was 83,592.

It is the principal business city on the Mississippi, between St. Louis and New Orleans, having a large trade throughout the Southwest. The sewerage system has been changed and the sanitation greatly improved since the yellow-fever epidemics of recent years. Eight lines of railroad and several steamboat lines furnish ample facilities for transportation. There are 4 daily and 13 weekly and monthly newspapers, 17 public and 19 private schools, and 59 churches, of which 31 are colored. There are 11 local insurance companies, with a capital of \$1,750,000, and a banking capital of \$1,670,000, with aggregate clearings in 1885 of \$84,000,000. Memphis ranks as the largest inland cotton-market in the world, and its trade in this staple is rapidly increasing, having risen from 112,296 bales in 1865-'66 to 430,127 in 1885-'86. One cotton-compress system has a capital of \$1,000,000, and has capacity for compressing 6,000 bales every twenty-four hours, and a storage capacity of 150,000. There are in the city about 300 manufacturing concerns, among them 11 saw- and planing-mills employing more than 400 hands, 5 large carriage-factories, 11 cotton-seed-oil mills, a cotton-factory, wood-working establishments, and others. The grocery-trade is very large; there are 29 exclusively wholesale houses. The wholesale trade in dry-goods, boots and shoes, and drugs is also very large, and the milling system and flour-trade are growing. The bulk meat-trade in 1885 aggregated 33,000,000 pounds. The old charter of the city was abolished in 1879, the city having become involved in debt, and the conduct of its affairs being generally unsatisfactory. The Legislature made it a "taxing district," with a new government, which has no power to contract debts or levy taxes. The Governing Council is composed of three commissioners and a Board of Public Works of five, elected for four years, and serving without compensation. Under its *régime* the debt has been settled and funded, and numerous improvements have been made. The new order was approved by the people at the election of January, 1886.

Milwaukee, the chief city and port of entry of Wisconsin, capital of Milwaukee County, on the west shore of Lake Michigan, 75 miles east of Madison, and 85 miles north by west of Chicago; latitude $43^{\circ} 2'$ north, longitude $87^{\circ} 54'$ west. The population in 1875 was 100,775; in 1880, 115,712; in 1885, 158,509, by the census returns. The estimate from the "Directory" in May, 1886, was 170,000, of whom about 100,000 were born in the United States. The Government has built a breakwater at the northern end of the bay on which the city is situated, at a cost of more than \$1,000,000. The Milwaukee river, which flows through the city, has been rendered navigable and docked to the heart of the city. The new buildings erected in 1885 cost \$4,500,000. The Northwestern Mutual Life-Insurance Company has built a very large stone business block on the site of

the Newhall House, which was burned with great loss of life in 1883. Among other new buildings are the depot of the Chicago, Milwaukee, and St. Paul Railway, St. Paul's Church, the Board of Trade Building, and the Light-Horse Squadron Armory. The city is the headquarters of three railways; the Chicago and North Western Railway also passed through. The public schools were attended in 1873 by about 12,000 pupils, and the private schools by about 7,000. Now the 28 public-school buildings accommodate nearly 30,000 pupils. A new high-school building was erected in 1886 at a cost of \$75,000. There are also a State Normal School, a Girls' College, and many other institutions of learning, among them a German-American Teachers' Seminary, and a German-American Academy. In 1885 work was begun on a new park on the lake-front, commanding a fine view of the lake from a height of 80 to 100 feet. It is named Juneau Park, in honor of Solomon Juneau, the pioneer of Milwaukee, and contains a monument to his memory—a figure in copper on a base of marble. A Washington monument was raised on Grand Avenue in 1885. A National Soldiers' Home is three miles west of the city. Milwaukee is the market for the products of a large section of country north and west, including the ore from the newly discovered Gogebic iron-range, an immense deposit of Bessemer ore. The grain-trade of Milwaukee has fallen off greatly within ten years, owing to the western extension of railroad lines. It reached its maximum in 1873, when the combined receipts of wheat and flour were over 40,000,000 bushels. The grain-trade, however, is still large. Ten elevators, with a storage capacity of 5,630,000 bushels, are employed in it. The total net receipts of all kinds of grain in 1885 were as follow:

Wheat, bushels.....	9,846,894
Corn, bushels.....	637,068
Oats, bushels.....	1,666,948
Barley, bushels.....	5,392,106
Rye, bushels.....	279,264
Total.....	17,822,230
Flour, reduced to bushels.....	10,046,480

The receipts of lumber from the Michigan saw-mills in 1885 were 238,000,000 feet, with 86,718,000 shingles, besides lath, posts, etc. The receipts of coal in 1875 were 228,644 tons; in 1885, 775,750 tons. The number of persons employed in 1870 in manufactures was 8,433; in 1880, 20,866. This does not include the employés in the Bay View or West Milwaukee Iron-Works. An important industry is the manufacture of beer. In 1885, 969,420 barrels of 31 gallons each were made, valued at \$6,054,336; 400,000 gallons of whisky; and 3,907,000 gallons of vinegar, valued at \$426,560. In 1873 the product of the breweries was valued at \$2,600,000; of the distilleries, \$1,500,000.

Minneapolis, a city, capital of Hennepin County, Minn., on both sides of the Mississippi river, at the Falls of St. Anthony, 14 miles above St. Paul by the stream, and 8 miles in a direct line west-northwest of that city. The

population in 1875 was 32,721; in 1880, 46,887; in 1885 it was estimated at 129,200. Among the finest buildings are the Exposition Building, the West Hotel, which cost \$1,500,000; the Post-Office, which cost \$750,000; the Lumberman's Exchange, the Tribune Building, the Syndicate Block, and the Masonic Temple. It has about 30 public schools, two daily newspapers, and 100 churches. Among the higher institutions of learning are the State University, Macalester College, Hamline University, and Augsburg Theological Seminary. About \$70,000,000 is invested in banking; 16 railroads have connections in the city, representing 15,000 miles of track. There are 20 elevators, with a capacity of 15,000,000 bushels. The commerce in 1885 exceeded \$140,000,000 in value. Minneapolis is said to be the greatest wheat-market in the world. There are 19 lumber-mills, cutting 300,000,000 feet of lumber annually; 26 flouring-mills, with a daily capacity of 36,148 barrels. The Pillsbury "A" Mill is the largest flouring-mill in the world. The manufacturing interests aggregate \$54,000,000; \$8,975,200 was expended in building operations in 1885.

Nashville, a city, capital of Tennessee and of Davidson County, on both sides of the Cumberland river, 192 miles above its mouth, a little north of the center of the State; latitude 36° 10' north, longitude 86° 49' west. The population in 1875 was 25,865, of whom 9,709 were colored; in 1886 75,000 (colored, 18,000), within the post-office delivery limits. The river is navigable for steamboats nearly 400 miles above the city. In 1883 a new charter was given to the city, abolishing the ward system, and providing for the government by an unpaid Council of ten elected from the city at large, with a mayor elected for two years, and a salaried Board of Public Works, holding the general control of affairs. There are 66 churches, 47 periodical publications, and 2 free libraries; 14 public-school buildings accommodate 8,000 children. The school property is valued at \$233,000. Higher institutions are Fisk University for colored teachers, Central Tennessee College for colored students, Vanderbilt University with over \$1,000,000 endowment, 3 medical colleges, Roger Williams's University, colored, and 28 academies, seminaries, and private schools, with an attendance (1885-'86) of more than 18,000 pupils and 423 teachers and professors. A new wagon and foot iron truss-bridge has been built over the Cumberland, 639 feet in length. The capital of the national banks is \$3,100,000. The individual deposits in these and the private banks aggregate \$4,000,000. The manufacturing interests of Nashville are large. Of a capital of \$10,865,000 invested in manufacturing in the four leading cities of Tennessee in 1884, it had \$4,995,500. Of the 2,670 business firms and companies, 708 are engaged in manufacturing; 700 commercial travelers are employed in the wholesale trade, which aggregates annually

more than \$70,000,000. About 5,300 mechanics and skilled laborers are employed within the postal delivery limits, excluding those in the railroad-shops. During the year 1883, \$1,215,000 was invested in machinery. There are three large cotton-factories, one of which employs 800 hands, and a woolen-factory. A chewing-gum factory employs 140 hands, and crackers and candy are manufactured in great quantities. There are 25 saw- and planing-mills, and 33 firms engaged in the lumber-trade. Nashville is the first hard-wood lumber-market in the country. In hardware, stoves, and hollow-ware, a large business is done. The flouring-mills have a daily capacity of 1,800 barrels. The iron interests of the South are largely controlled there. One firm alone, representing \$9,000,000, is engaged in mining and manufacturing in Tennessee and Northern Alabama.

Newark, a port of entry and the chief city of New Jersey, capital of Essex County, on the west bank of Passaic river, 4 miles above its entrance into Newark Bay, and 9 miles west of New York; latitude $40^{\circ} 44'$ north, longitude $74^{\circ} 10'$ west. The population in 1870 was 105,059; in 1880, 136,508; in 1886, 154,000. Over 80 passenger-trains pass through the city daily, over the five lines of railway. There are graded public schools, incorporated academies, German theological schools, 2 public libraries, 7 daily newspapers, and about 100 churches. Newark is noted for the extent and variety of its manufactures. The manufacture of celluloid and cellulose goods is almost wholly confined to this city. The report of the Board of Trade for 1872 gave the total product of the sales of manufactured goods and wares as \$72,879,036. Of this about \$52,000,000 was the product of the manufacturers of the city. In 1880, the total value of products manufactured in the city was \$69,252,705. The number of establishments increased in about the same time from 1,015 to 1,319, and the number of hands employed from 29,174 to 30,046. Following are some of the most important manufactures, with the capital invested, and the total value of products in 1880:

BUSINESS.	Capital.	Value of products.
Leather.....	\$3,515,433	\$14,646,578
Gold, silver, and metal refining.....	212,000	8,794,600
Jewelry.....	2,517,899	4,002,677
Malt and malt liquors.....	2,592,300	4,508,707
Hats and caps.....	691,300	2,262,894
Cotton, woolen, and silk goods.....	1,460,000	2,212,250
Trunks, bags, and frames.....	811,800	2,138,928
Men's clothing.....	438,619	2,055,105
Boots and shoes.....	411,075	1,886,504
Slaughtering and meat-packing.....	288,000	1,653,016
Machinery.....	1,450,850	1,630,077
Saddlery hardware.....	700,200	1,496,008
Building.....	223,050	1,409,974
Chemicals.....	1,570,000	1,402,880
Fertilizers.....	475,000	1,400,000
Celluloid and cellulose goods.....	1,209,000	1,251,540
Harness.....	494,375	1,197,204
Sewing-machines.....	203,370	1,062,500
Rubber, enameled, and oil-cloth.....	355,000	1,039,040
Iron and steel.....	950,125	1,014,023

New Bedford, a city, port of entry, and one of the capitals of Bristol County, Mass., on the west side of Acushnet river, near its mouth in Buzzard's Bay, 56 miles by rail south by east of Boston; latitude $41^{\circ} 39'$ north, longitude $70^{\circ} 56'$ west. The population in 1870 was 21,320; in 1880, 26,845; in 1885, 33,393. The whale-fishery, for which New Bedford has been noted, has steadily declined in recent years. The total value of the importations of oil and bone was greatest in 1853, amounting to \$10,763,107.83. The amount of capital, vessels and tonnage employed in the industry, reached its highest point in 1857. The number of whalers at that date was 329; in 1876 it was 116; and in 1886, 78. But, while this industry has declined, owing to the discovery of petroleum, the growing scarcity of whales, and other causes, large manufacturing interests have grown up in the city. The Wamsutta Cotton-Mills were established in 1848, with a capital of \$160,000 and 15,000 spindles. In 1876 they had 86,000 spindles; in 1886, 202,000. The Potomac Mills, for print-cloths, had 22,500 spindles in 1876, and 106,000 in 1886. The Grinnell and Acushnet Mills have 62,500 spindles each. Other important manufactures are those of soap and candles, boots and shoes, iron and copper, leather, glass, cordage, and paints. The amount of capital invested in the manufacture of soap and candles in 1880 was \$900,000, and the value of products, \$1,288,981. There are two manufacturing photographic establishments, a glass decorating establishment, two electric-light companies, three carriage-factories, and Prussian-blue works. The total value of manufactured products in 1873 was about \$8,000,000; in 1880 it was \$9,835,955.

New Haven, a town, city, and port of entry, capital of New Haven County, and the largest city of Connecticut, at the head of New Haven bay or harbor, 4 miles from Long Island Sound, 36 miles by rail south-southwest of Hartford, and 74 miles east-northeast of New York; latitude $41^{\circ} 18'$ north, longitude $72^{\circ} 57'$ west. The population in 1870 was 50,840; in 1880, 62,882; in 1886, 76,600. The harbor has been improved at its entrance by a jetty built on the west shore, and by a breakwater surmounted by a lighthouse two miles south of the old lighthouse. The city owns 350 acres on the summit of East Rock, used as a public park; \$100,000 has already been spent upon it, about one half of which was the gift of private individuals. A soldiers' monument, 125 feet in height, stands on the highest point of the rock. Five railroads enter the city. In 1880 the entrances and clearances of vessels in the foreign trade were 96 and 37; of those in the coastwise trade and fisheries, 952 and 733; the number of vessels in the district, 227; the number built during the year, 35. Prominent among the manufactures are those of carriages, corsets, hardware and tools, iron products, India-rubber goods, and fire-arms.

The Marlin, Whitney, and Winchester Arms Companies have their establishments there, the last named having a capital of \$1,000,000. Following is a table of the capital and products of some branches of manufacture in 1880:

BUSINESS.	Capital.	Value of Products.
Slaughtering and meat-packing.....	\$222,000	\$4,160,780
Corsets	500,600	2,109,459
Hardware.....	978,500	1,954,260
Tools.....	283,000	248,085
Carriages and wagons.....	910,400	1,699,154
Carriage and wagon materials.....	899,199	860,675
Men's clothing	463,966	1,122,080

The whole amount of capital invested in manufacturing was \$9,703,737, the number of hands employed 15,156, and the total value of products \$24,040,225.

New York, a city of the State of New York, coextensive with the county of the same name, the commercial metropolis of the United States, and the most populous city in the Western hemisphere, situated at the mouth of the Hudson river, 18 miles from the Atlantic Ocean; latitude of the City Hall $40^{\circ} 42' 48''$ north, longitude $74^{\circ} 0' 3''$ west. The population in 1870 was 942,292, of whom 419,094 were of foreign birth; in 1875 it was 1,046,037; in 1880, 1,206,299. No census was taken in 1885. But from a comparison of the names in the city directories since 1880 it was calculated that the population is increasing at the rate of about 37,000 a year. Of the population in 1880, 727,629 were native-born and 478,670 of foreign birth. The number of dwellings in 1870 was 64,044; in 1880 it was 73,684, giving an average in 1870 of 14.72, and in 1880 of 16.37 persons to each dwelling. The number of families in 1880 was 243,157, with an average of 4.96 persons to each family. The average transient population in 1870 was estimated at 30,000; in 1880, at from 50,000 to 100,000. The facilities for transit between the various parts of the city have been greatly improved within ten years. The great suspension-bridge across the East river to Brooklyn was opened to the public in 1883, and cable-roads across it are in operation. There are four lines of elevated railroads, known as the Second, Third, Sixth, and Ninth Avenue lines; the Third Avenue line has a branch from Chatham Square to the City Hall, and one running through Forty-second Street to the Grand Central Depot. The Sixth Avenue line crosses Fifty-third Street to Ninth Avenue. The Second Avenue line has bridged the Harlem river, and extended its tracks over the mainland. At the termination of the Sixth and Ninth Avenue lines, which, above Central Park, run over Eighth Avenue, is the depot of the New York City and Northern Railroad. All the elevated roads are leased by one corporation, known as the Manhattan Railway Company. There is a cable-road on Tenth Avenue from One Hundred and Twenty-fifth to One Hundred and

Eighty-fifth Street; and another is nearly completed on One Hundred and Twenty-fifth Street, from river to river. The cars run every few minutes during the day, and most of them through the night. Railroad connections have been improved; seven roads enter the city, but the majority have their depots in Brooklyn, Jersey City, or Hoboken. The West Shore Railway, now controlled by the Central, passes up the west shore of the Hudson and through the principal cities from Albany to Buffalo. Connection will soon be made from New York with the Baltimore and Ohio. There are nineteen ferries across the East river, two to Staten Island, one to Bay Ridge, Long Island, and nine across the Hudson river. Regular lines of steamships run to nearly all European ports. There are numerous lines of coast and river steamboats running to points on the sea-coast and the rivers. Steam for heat and power is supplied through pipes underground to many buildings. It is intended to place the telegraph and telephone wires under-ground. For some years past operations have been carried on for the removal of the obstructions in the East river at Hell Gate, and much has been accomplished for the improvement of navigation, though the work is not yet completed. The Bartholdi Statue of Liberty, presented to the Republic by the Republic of France several years ago, has been placed on its pedestal at Fort Wood, Bedlow's Island, in the harbor, and was dedicated with appropriate ceremonies in 1886. Riverside Park, extending from Seventy-second to One Hundred and Twenty-ninth Street, and bordering on the Hudson, has been improved, and contains the tomb of Gen. U. S. Grant. It is proposed to lay out large parks on the mainland north of Harlem river, and the Legislature has authorized the purchase of the necessary land. Prominent among new buildings are the Barge Office, a handsome granite building at the Battery, and the Produce Exchange on Whitehall Street. The total amount of business done at the post-office in 1885 was \$70,534,363.01. Much of the vacant space on the west side of the city and beyond the Harlem river is used for market gardens. The census of 1880 reported 2,229 persons engaged in agricultural pursuits within the city limits. The police force has been increased in ten years from about 2,500 to 3,000 men, the number of steam fire-engines from about 45 to 54. In about the same time the number of hospitals has increased from 25 to 36; of dispensaries, from 30 to 47; and the number of orphan asylums and homes to 103. There are 20 colleges and seminaries, and 24 medical institutions, colleges, and societies for instruction. The total number of libraries is 33. The number of churches has increased from 350 to 424, and of periodicals from 400 to 631, of which 30 are daily. Some handsome armories for the State militia have recently been built. A new aqueduct is in process of construction.

CITIES, AMERICAN. (NORFOLK.)

The following table shows the valuation of property, the debt, etc., in 1876 and 1886:

ITEMS.	1876.	1886.	ARTICLES.	1875.	1885.
Assessed value of real estate.	\$892,428,165	\$1,208,941,065	Dutiable merchandise.....	\$285,898,509	\$264,142,862
Assessed value of personal property.....	218,626,178	217,027,221	Free merchandise.....	91,791,583	119,397,654
Total valuation.....	\$1,111,054,843	\$1,420,968,286	Specie and bullion.....	18,488,557	17,701,094

Foundry and machine-shop products.....	287	10,635,508	14,710,835
Sugar and molasses, refined.....	5	2,730,000	11,330,888

The relative value of imports and exports for 1875 and 1885 is shown by the following tables:

ITEMS.	ARTICLES.	1875.	1885.
IMPORTS:			
Dutiable merchandise.....	\$285,898,509	\$264,142,862	
Free merchandise.....	91,791,583	119,397,654	
Specie and bullion.....	18,488,557	17,701,094	
Total.....	\$840,628,119	\$401,241,550	
EXPORTS:			
Merchandise, domestic.....	247,681,724	821,149,580	
Merchandise, foreign.....	8,780,444	9,669,118	
Specie and bullion.....	67,556,650	24,641,266	
Total.....	\$824,018,818	\$355,459,959	

The following tables show the movements of shipping for the years ending June 30, 1875, and June 30, 1885:

FOREIGN TRADE.	1875.	1885.
Number of entrances.....	5,541	5,824
Tonnage of entrances.....	4,421,074	5,659,788
Number of clearances.....	5,221	5,304
Tonnage of clearances.....	4,811,488	5,440,724

DESCRIPTION.	VESSELS BELONGING—	
	In the district in 1875.	To the port of New York in 1885.
Number of sailing-vessels.....	2,792	2,487
Tonnage of sailing-vessels.....	606,856	573,905,12
Number of steamers.....	796	1,028
Tonnage of steamers.....	840,191	864,169,58
Number of canal-boats.....	2,218	209
Tonnage of canal-boats.....	216,663	21,178,54
Number of barges.....	587	465
Tonnage of barges.....	128,880	98,407,05
Total number.....	6,888	4,189
Total tonnage	1,287,040	992,668,29

The whole number of aliens landing at this port from 1847 to 1874, inclusive, was 5,438,544, an average of 194,234 a year. The whole number from 1875 to 1885, inclusive, was 2,696,921, an average of 245,175 a year. Of those that landed in 1885, 33,009 came from England, 35,597 from Ireland, 98,111 from the German Empire, 16,033 from Italy, 15,707 from Sweden, and 16,578 from Russia.

Norfolk, a city and port of entry of Norfolk County, Va., on the north bank of Elizabeth river, opposite the city of Portsmouth, which is connected with it by ferry, and virtually forms a part of it. It is 8 miles above Hampton Roads, 32 miles from the Capes of Virginia, 17 miles by land from the Atlantic, and 88 miles southeast by east of Richmond; latitude $36^{\circ} 51'$ north, longitude $76^{\circ} 19'$ west. The population in 1875 was 19,229; it is now 22,000. That of Portsmouth is 14,000. The port is the terminus of seven railroads, and regular lines of steamers connect it with the large seaports of the country. Communication with inland towns is furnished by the Albemarle and Chesapeake and the Dismal Swamp Canals. A Chamber of Commerce and a Cotton Exchange are common to the two cities. Large quantities of oysters and early fruits and vegetables are shipped to Northern ports. In this trade the city ranks first in the country, and in cotton third. The value of exports from the customs district, which in-

cludes Portsmouth, for 1874-'75 was \$5,243,986; for 1884-'85 it was \$10,341,403. The shipments of cotton during the latter year amounted to 552,806 bales. This port is also the largest pea-nut market in America; nearly 1,500,000 bushels are handled in a year.

Northampton, a city, and the shire town of Hampshire County, Mass., on the west bank of Connecticut river, 80 miles west of Boston, and 17 miles by rail north of Springfield; latitude $42^{\circ} 19'$ north, longitude $72^{\circ} 38'$ west. The population in 1875 was 11,108; in 1886, 13,680. It was incorporated as a city in 1882. Smith College, an institution for the higher education of women, is located here. The John Clarke Library contains 20,000 volumes, and will soon be greatly increased by the bequest of Judge Forbes. Three railroads pass through, and the city has a street-railway and electric lights. A stream passing through affords good water-power, which is utilized for manufacturing purposes, chiefly of silk and cotton goods.

Omaha, the largest city of Nebraska, a port of entry and the capital of Douglas County, on the Missouri river, opposite Council Bluffs, Ia., with which it is connected by an iron bridge, and 490 miles by rail west by south of Chicago. The population in 1870 was 16,083; in 1875 it was about 20,000; in 1880, 30,518; in 1886, about 72,000. It was laid out in 1854, and incorporated in 1857. The highest of the bluffs, once occupied by the Capitol of the State, is now crowned by the high-school building, one of the finest in the West. The Court-House is a handsome building of sandstone. A system of water-works distributes water from the Missouri river over the whole city. The Waring system of sewerage has been introduced into the more thickly settled parts. The streets are lighted by gas and electricity. The headquarters of the Department of the Platte are here, and 4 miles northwest is Fort Omaha, where a regiment of troops is stationed. Omaha is the eastern terminus of the Union Pacific Railway, and is also a terminus of five other railways. A new bridge over the Missouri river is in process of construction, and when it is completed several other railroads will enter the city and find station-room in a union depot now building. The Union Pacific shops cover a large area, and give employment to more than 1,300 men. The largest smelter in the country is here, and employs 450 men. The Willow Springs Distillery is the fourth in size of its kind in the United States, employing 125 men. Among other manufacturing establishments are nail-works, linseed-oil works, lead-works, foundries, packing-houses, and breweries. Adjoining the city proper is South Omaha, where are large stock-yards and the packing-houses of a number of Eastern and European firms. A large wholesale trade is done here in dry-goods, boots and shoes, groceries, and drugs, Omaha being the chief market for the Territories west of Nebraska.

Oswego, a city, port of entry, and one of the capitals of Oswego County, N. Y., on the south-east shore of Lake Ontario, at the mouth of the Oswego river, 305 miles by rail northwest of New York, and 170 miles west of Albany; latitude $43^{\circ} 28'$ north, longitude $76^{\circ} 30'$ west. The population in 1870 was 20,910; in 1880 it was 21,116; and in 1885, about 25,000. The city has communication by four railroads. Large quantities of coal are brought from the coal-fields of Pennsylvania and shipped to Canada and the West. For many years the business of the city was mainly confined to shipping, forwarding, and the manufacture of flour. Since 1865 these industries have declined, owing to the increase of railroad facilities and the manufacture of flour in the West. Other manufactures, meantime, have largely increased. The Oswego Starch-Factory, with a capacity of 35 tons a day, is the largest in the world. There are four flouring-mills, iron-works where portable steam-engines, agricultural implements, steam shovels and dredges, stationary and marine engines and boilers, steam-pumps, land-excavators, water-wheels, mill-machinery, brass and iron castings, and other products are made; ship and boat yards, malt-houses, planing-mills, and other manufacturing establishments. The flour- and grist-mill products for 1880 amounted to \$1,591,759; the foundry and machine-shop products to \$552,780; and the planed lumber to \$238,932. The whole amount of capital invested in manufactures was \$2,611,238, and the entire value of products was \$5,619,944. The total value of imports was \$5,403,710, and of exports, foreign and domestic, \$997,872. In the foreign trade there were 2,264 entrances with a tonnage of 374,216, and 2,256 clearances with a tonnage of 370,088. In the coast trade and fisheries the entrances were 411, with 80,030 tonnage, and the clearances 465, with 72,584 tonnage. The number of vessels registered, enrolled, and licensed in the district was 130, with tonnage of 22,219. During the year four vessels, with 724 tonnage, were built.

Peoria, a city, capital of Peoria County, Ill., on the Illinois river, at the foot of an expansion called Peoria Lake, 160 miles by rail southwest of Chicago. The population in 1875 was 22,849; in 1886, 40,000. It has unusual transportation facilities—twelve railroads, besides the river and a canal. Street improvements are rapidly carried on and many fine buildings have been recently erected, notably a court-house, completed in 1879 at a cost of \$300,000; a Board of Trade building, finished in 1877; a new hotel, in 1885, at a cost of \$245,000; a union depot, and a workhouse. Others in process of erection are a post-office and United States court-house, to cost about \$250,000; a high-school building, \$75,000; a cathedral, \$225,000; and a Congregational church, \$100,000. Among the leading manufactures are distilled spirits—the total capacity of the 13 distilleries being 44,510 bushels

of grain in each twenty-four hours, and the internal revenue upon the product amounting to about \$1,250,000 each month—glucose, corn-starch, pottery, watches, agricultural implements, foundry and machine-shop products, wagons and carriages, and planed lumber. Peoria is also a large market for grain, especially corn and oats. There are six elevator warehouses for the storage of grain, with an aggregate capacity of 2,400,000 bushels, and a total transfer capacity of 600 cars. The following table shows the receipts and shipments of some of the leading articles for the years 1884 and 1885:

ARTICLES.	RECEIPTS.		SHIPMENTS.	
	1884.	1885.	1884.	1885.
Oats, bushels..	12,947,370	15,354,780	13,905,860	15,408,720
Corn, bushels..	9,501,280	11,602,855	5,402,300	7,087,600
High wines and liquors, bbls.	4,191	8,858	211,730	208,688
Starch, lbs..			1,503,000	3,110,800
Bulk meats, lbs.	1,028,600	2,800,700	1,996,500	1,952,500
Broom-corn, lbs.	1,089,700	1,509,400	608,670	965,960
Hides and pelts, lbs.....	268,000	476,100	995,250	1,166,400

Philadelphia, the chief city of Pennsylvania and the second of the United States in population, coextensive with the county of the same name, on the Delaware river, at the mouth of the Schuylkill, 96 miles from the Atlantic Ocean, 125 miles in a direct line northeast of Washington, and 85 miles southwest of New York; latitude $39^{\circ} 57'$ north, longitude $75^{\circ} 9'$ west. The population in 1870 was 674,022; and in 1880, 847,170. The number of families, at the last-named date, was 165,044, with an average of 5·13 persons to a family; the number of dwellings, 146,412, averaging 5·79 persons in each. The assessed value of property in 1886 was \$611,309,615, the true value at least twice that sum. In 1874 the true value was estimated at \$1,025,785,831. The tax on real estate in 1886 was \$10,879,121.16; in 1875 it was \$10,518,462.86. The funded debt, Jan. 1, 1875, was \$55,272,132.40; Jan. 1, 1886, it was \$62,305,245.22. The floating debt in 1875 was \$4,018,931.25; in 1886 it was \$521,558.55. The number of national banks has increased in about ten years from 30, with an aggregate capital of \$17,135,000, to 35, with capital of about \$18,000,000, while the number of State banks has fallen from 12, with capital of about \$1,000,000, to 6, with about \$720,000. The 5 safe deposit and trust companies have increased to 8, and the number of savings-banks has fallen from 6 to 3. The number of public schools has increased from 424 to 472, and the average attendance at them from 79,565 to 99,446. The number of volumes in the Mercantile Library has grown from 126,000 to 142,000; in the Philadelphia, from 100,500 to 125,000; in that of the Academy of Natural Sciences, from 30,000 to 35,000. In 1880, Philadelphia had communication by 8 railroads, and the size of the Delaware gives it the advantages of a sea-

port. The growth of its foreign commerce is shown by the following table:

YEARS.	Imports.	Exports—foreign and domestic.
1870	\$14,500,797	\$16,984,610
1875	24,236,887	25,611,654
1880	85,961,292	49,649,693
1885	88,365,242	87,281,739

The increase in manufactures from 1870 to 1880 is shown by the following table:

ITEMS.	1870.	1880.	1882.
Number of establishments	8,184	8,567	12,068
Number of hands	187,496	155,527	242,483
Amount of capital	\$174,016,674	\$187,148,851
Value of materials	\$150,325,718	\$199,155,477
Amount of wages	\$55,780,180	\$64,265,966
Value of products	\$322,004,517	\$324,842,935	\$481,226,809

The following gives the figures for 1880 of some of the leading manufactures:

INDUSTRY.	Capital.	Products.
Sugar and molasses, refined	\$6,072,000	\$24,294,929
Woolen goods	11,752,000	21,349,510
Mixed textiles	8,391,651	14,998,779
Worsted goods	4,459,639	8,327,282
Cotton goods	8,832,550	14,268,696
Dyeing and finishing textiles	2,359,846	4,816,405
Carpets	7,194,458	14,268,510
Clothing, men's	8,726,276	18,506,749
Clothing, women's	792,950	2,466,410
Foundry and machine-shop products	12,231,058	18,455,288
Drugs and chemicals	10,158,164	11,804,718
Boots and shoes	2,970,190	9,084,496
Hosiery and knit goods	3,402,690	8,178,415
Slaughtering and meat-packing	1,965,625	7,869,114
Printing and publishing	5,728,911	6,884,964
Leather, dressed skins	2,584,747	6,741,796
Liquors, malt	7,255,350	5,897,811

The deposits of gold of domestic production made at the United States Mint from its earliest period to the close of 1880 amounted to \$873,097,015.62, and of native silver to \$121,924,919.14.

Pittsburg, the second city of Pennsylvania in population and importance, county-seat of Allegheny County, at the confluence of the Allegheny and Monongahela rivers, which here form the Ohio, opposite Allegheny City, 466 miles above Cincinnati, and 256 miles west by north of Philadelphia; latitude $40^{\circ} 27'$ north, longitude $79^{\circ} 59'$ west. The population in 1870 was 86,076; in 1875, after annexations, it was estimated at 140,000; in 1880 it was 156,389; in 1886 it was estimated at 186,700, and that of Allegheny City 89,560. Three new railroads entering the city have been built during the past ten years, and several small branch roads have been chartered and surveyed. The introduction of natural gas, and its almost universal use in the manufactories, have made a very important change. It is estimated that its use has displaced 190,000 bushels of coal a day, or in 250 working-days over 48,000,000 bushels. There are now six chartered gas companies doing business in the city, one of which has more than 350 miles of pipe. It is estimated that the gas has increased the productive ca-

pacity of the mills over 20 per cent. Pittsburg is the great center of the iron industry. The value of the production of iron and steel alone in 1880 amounted to \$35,490,634. During the first half of 1886, 2,637,687 tons of pig-iron were produced, and the following figures are given in regard to the leading industries:

INDUSTRY.	Capital.	Hands.	Value of products.
Coal and coke	\$20,000,000	25,000	\$20,000,000
Rolling-mills	23,000,000	25,000	85,000,000
Engines and mill-machinery	3,500,000	2,750	5,000,000
Boilers, etc.	850,000	1,200	2,000,000
Steel-works	15,000,000	10,000	28,000,000
Railroad supplies and bridges	8,000,000	2,450	6,000,000
Blast-furnaces	6,00,000	3,000	10,000,000
Total.....	\$81,850,000	69,400	\$106,000,000

These figures, however, are far beyond those of the census of 1880, which gives the capital employed in all manufacturing industries as \$52,645,010, the number of hands employed as 36,930, and the total value of products, \$75,915,033.

About one quarter of the pig-iron produced in the United States is consumed in Pittsburg and Allegheny. The annual product of the rolling-mills is about 1,305,212 tons, two thirds of which is steel. The number of rolling-mills has increased in about ten years from 16 to 46, and the 8 steel-works to 20. The glass-manufacturing establishments, which numbered 45, now number 84, and the annual value of the product is more than \$10,000,000. The leading firms are competing with the best manufacturers of Limoges, Carlsbad, Bohemian, and other celebrated glasswares. Over \$4,000,000 of capital is invested in insurance business, and the risks average annually over \$150,000,000. A new court-house and jail, of Massachusetts granite, is in process of construction, to cost nearly \$3,000,000. A Government building, to be used as a post-office, begun seven years ago, is now little above the foundation.

Portland, a city and port of entry, capital of Cumberland County, Maine, the largest city in the State, on a peninsula projecting into Casco Bay, 63 miles by rail south-southwest of Augusta, and 108 miles north-northeast of Boston; latitude 43° 39' north, longitude 70° 15' west. The population in 1870 was 31,413; in 1880 it was 33,810; in 1886 it was estimated at 36,000. The suburbs, or adjoining towns of Deering, Cape Elizabeth, and Falmouth have about 14,000 inhabitants, who contribute to the business prosperity of the city. The valuation of property in 1880 was \$30,184,928; and in 1886, \$33,432,000. There are in the city six national banks, a trust company, several private banking firms, and two savings-banks, whose deposits aggregate \$10,000,000. The Public Library has about 30,000 volumes, and the Maine Historical Society has a library and cabinet here. There are 21 public schools, with an average attendance of 4,327. Six

railroads enter the city. The total value of imports in 1880 was \$1,391,086, and of exports \$3,967,250. The number of persons employed in the fisheries in the same year was 1,651, the capital invested was \$755,951, and 41,060,900 pounds of fresh fish were taken; 82,000 barrels of mackerel were packed in 1885. The canned provision trade is of growing importance. The lumber-trade is large; 85,000,000 feet of long spruce lumber alone was shipped from the port in 1885. The whole amount of capital invested in manufactures in 1880 was \$4,243,225, and the entire value of products \$9,832,931. Following are statistics of some of the most important of them:

INDUSTRY.	Capital.	Value of products.
Fruits and vegetables, canned and preserved	\$700,000	\$1,050,000
Slaughtering and meat-packing	150,000	667,000
Boots and shoes	166,000	629,000
Foundry and machine-shop products	527,000	600,400
Clothing, men's	146,800	345,500
Lumber, planed	85,000	291,056
Ship-building	112,400	242,818
Printing and publishing	155,900	227,189

Poughkeepsie, a city, capital of Dutchess County, N. Y., on the east bank of Hudson river, 75 miles by rail north of New York, and 70 miles below Albany; latitude 41° 40' north, longitude 73° 55' west. The population in 1870 was 20,080; in 1880, 20,207. The total valuation of property in the latter year was \$11,799,293. The city is on the Hudson River Railroad, and is the western terminus of the Poughkeepsie, Hartford, and Boston. Piers have been built for a new bridge across the Hudson. Following are statistics for 1880 of some of the principal manufacturing industries:

INDUSTRY.	Capital.	Value of products.
Iron and steel	\$918,000	\$746,548
Boots and shoes	511,400	202,596
Cooperage	64,000	200,000
Clothing, men's	60,500	176,500
Liquors, malt	76,000	185,301

The whole amount of capital invested in manufactures was \$3,728,700; the entire value of products, \$4,392,900.

Reading, a city, capital of Berks County, Pa., on the east bank of the Schuylkill river, and on the Schuylkill and Union Canals; 54 miles by rail east by north of Harrisburg, and 58 miles northwest of Philadelphia; latitude 40° 20' north, longitude 75° 55' west. The population was 33,930 in 1870, and 43,278 in 1880. It is now (1886) estimated at 55,000. The total valuation of property in 1880 was \$19,343,858. The city has unusual railway advantages, being the center of the Philadelphia and Reading, and the terminus of the East Pennsylvania, Lebanon Valley, Reading and Columbia, and Wilmington and Northern roads. Following shows the statistics of the principal manufactures in 1880.

INDUSTRY.	Capital.	Value of products.
Iron and steel.....	\$2,315,000	\$4,074,447
Wool hats.....	511,000	1,142,384
Foundry and machine-shop products.....	668,262	967,200
Hardware.....	422,268	579,789
Liquors, malt.....	576,000	889,200

The whole amount of capital invested in manufactures was \$7,498,256; the entire value of products, \$13,251,095.

Richmond, a city, port of entry, and the capital of Virginia and of Henrico County, the largest city in the State, on the north bank of James river, at the head of tide-water and at the lower falls, about 100 miles from the mouth of the river, and 97 miles south-southwest of Washington; latitude $37^{\circ} 32'$ north, longitude $77^{\circ} 27'$ west. The population in 1870 was 51,038, of whom 23,110 were colored; in 1880 it was 63,882; in 1883 it was estimated at 70,945, the adjoining suburbs at 4,683, and the city of Manchester, on the opposite side of the river, 7,000, all together 82,628. Improvements are in progress in the river which are expected to render the docks accessible to vessels drawing 22 feet. Six lines of railroad intersect here, and regular lines of steamers run to Norfolk, Baltimore, Philadelphia, and New York. The chief articles of export are tobacco and flour. About 16,520 hands are employed in manufactures, the most important of which are iron-works, foundries and machine-shops, flouring-mills, and tobacco-factories. Among the articles most largely manufactured are smoking and chewing tobacco, cigars and cigarettes, agricultural implements, stoves, tobacco fixtures, nails and spikes, bar-iron, fertilizers, cedar-ware, boots and shoes, boxes, paper, cotton goods, and earthenware. Ten years ago the number of hands employed was about 16,000.

Rochester, a city, port of entry, and the capital of Monroe County, N. Y., on Genesee river, 7 miles from its mouth, and 229 miles by rail west-northwest of Albany; latitude $43^{\circ} 8'$ north, longitude $77^{\circ} 40'$ west. The population in 1870 was 62,386; in 1880, 89,366; in 1886 it was estimated at 122,000. From 1875 to 1886 the number of public schools increased from 20 with 11,275 pupils, to 32 with 14,156 pupils. About 30 periodicals are published, of which 6 are daily, 4 English, and 2 German. An Academy of Science was incorporated in 1881. The Powers Art-Gallery has one of the finest collections in the country, and the university one of the best cabinets and Museums of Natural Science. The Warner Observatory was built in 1883 at a cost of \$100,000, and furnished with a telescope costing \$13,000 more. The Reynolds Library was incorporated in 1884, and opened to the public in 1886. The Central Public Library has about 10,000 volumes, the Law Library 10,000, the University Library 22,000, and the Theological Seminary Library 21,000. The Reynolds Memorial Chemical Laboratory has just been added to the Uni-

versity buildings at a cost of \$25,000, and Rockefeller Hall within a few years to those of the Theological Seminary at a cost of \$38,000. Among other new buildings are the Powers Hotel, which cost \$630,000, and the Warner Building, \$500,000. A Government Building, to cost \$500,000, is in process of erection. A new street has been opened near the center of the city at a cost of \$165,000. The semi-centennial of the city's incorporation was celebrated in 1884. Eight railroads enter the city. In 1882-'83 the tracks of the New York Central through the greater part of the city were elevated, and a new train-house and depot were built, at an entire cost of about \$2,000,000, the streets, river, and race being spanned by iron bridges, and 38,812 yards of masonry built in retaining-walls. The New York, Lake Erie, and Western has a new train-house and depot in process of construction. Railroads to Lake Ontario and Irondequoit Bay have multiplied cottages and hotels at these resorts, and the travel often amounts to several thousand passengers a day. There are six banks of circulation and discount, with a total capital and surplus of over \$2,000,000. Four savings-banks, in their reports of July 1, 1886, show deposits of \$19,623,962, surplus \$2,890,737, and 41,071 depositors. The savings of many citizens go into the loan and building associations, of which there are 42. Rochester owes the beginning of its prosperity to the water-power afforded by the falls of the Genesee. It was formerly noted for its manufacture of flour, being at one time first in the country and even in the world in that manufacture. This is still an important industry, although it has relatively declined. The nursery business done here exceeds that of any single State except New York. Some of the leading seed-houses of the country also are located here. A large amount of men's clothing, boots and shoes, beer, tobacco, proprietary medicines, and perfumery are manufactured. In clothing, Rochester does an amount of business which gives it rank as the fourth city in the Union in this respect. Following are some statistics of 1880:

MANUFACTURES.	Capital.	Value of products.
Clothing, men's.....	\$1,976,200	\$4,342,000
Boots and shoes.....	1,180,940	8,686,985
Flouring- and grist-mill products.....	568,500	2,550,515
Liquors, malt.....	1,083,071	1,411,992
Foundry and machine-shop products.....	988,500	1,262,129
Tobacco, including cigars and cigarettes.....	582,975	1,837,470
Carpentering.....	194,075	1,099,000
Printing and publishing.....	474,883	660,888
Furniture.....	219,000	647,900
Furniture, chairs.....	200,000	265,000
Patent medicines.....	851,900	597,800
Carriages and wagons.....	564,000	461,989
Bread and other bakery products.....	136,890	381,583
Tin-copper- and sheet-iron ware.....	212,200	328,510
Clothing, women's.....	74,000	298,000
Leather, tanned.....	116,000	265,677
Marble and stone work.....	264,300	247,828
Wood, turned and carved.....	103,200	245,300
Looking-glass and picture frames.....	75,500	207,000
Cutlery and edge-tools.....	204,500	200,700

The whole amount of capital invested in manufacturing was \$13,161,870, the number employed 14,607, and the total value of products \$26,478,266.

Sacramento, a city, capital of California and of Sacramento County, the fourth city in the State, 83 miles by rail east-northeast of San Francisco; latitude $38^{\circ} 33'$ north, longitude $121^{\circ} 20'$ west. The population, in 1875, 16,283; in 1886, 22,490. New and important buildings are the State Printing-House and Exposition Building, and the E. B. Crocker Art-Gallery. New institutions are a public high-school, a business college, and an art school. There are large shops for the manufacture of furniture, one of the largest potteries in the State, and flouring and woolen mills.

Saint Joseph, a city, port of entry, and capital of Buchanan County, Mo., on the great east bend of Missouri river, 260 miles west by north of St. Louis, and 390 miles west southwest of Chicago. The population in 1875 was 19,565; and in 1886 estimated at 60,000. The city has river communication downward to the Gulf and upward to the mouth of the Yellowstone, and good railroad facilities. New railroads are in process of construction and others are projected. The Government is building a custom-house to cost \$300,000. One of the fish-hatcheries of the State is here. The city has water-works, electric lights, good sewerage, and many miles of paved streets. The citizens have invested \$6,745,000 in the cattle-trade of the West. The wholesale trade has rapidly increased. In 1874 it amounted to about \$18,000,000; in 1885, to \$93,427,623. Manufacturing industries also are developing rapidly. In 1885 the amount of capital employed in them was \$7,040,000; the number of hands, 6,121; the wages paid were \$1,899,000; and the value of products, \$18,861,981. Among the new establishments opened in 1886 are stone-works, coffee and spice mills, several overall and shirt factories, employing 500 to 1,000 hands each, and an additional roller flour-mill.

Saint Louis, the chief city of Missouri, and the commercial metropolis of the central Mississippi valley, on the right bank of the Mississippi river, 20 miles below the entrance of the Missouri, about 175 miles above the mouth of the Ohio, 1,170 miles above New Orleans, and 125 miles east of Jefferson City; latitude $38^{\circ} 37' 28''$ north, longitude $90^{\circ} 15' 16''$ west. The population in 1870 was 310,864, 112,249 of whom were foreigners and 22,088 colored; in 1880 it was 350,518, and in 1886 estimated at 420,000. More than half of the registered voters in that year were foreigners. In 1875 the city was separated from the old county of St. Louis, and under the present charter stands in the same relation to the State as a county. Under the same act the city limits were extended so that the city covers an area of nearly 40,000 acres. The former city of Carondelet is now incorporated with St. Louis. Since

1870 the business portion has spread over many blocks to the west, crowding out the dwellings; and all the churches there, except the cathedral, have followed the movement and built new edifices. In 1885, 1,991 new brick and 504 frame buildings were erected, at a cost of \$7,376,519, nearly double the outlay for that purpose in 1876. Important buildings recently erected are a custom-house and post-office, which cost \$6,250,000; the Exposition and Music Hall Building, which cost over \$800,000; the Art Museum, built at a cost of about \$200,000; the Chamber of Commerce, \$1,500,000; and Armory Hall. The Equitable Insurance Company's building has been built five stories higher, making in all eleven stories, at a cost of \$200,000. The Fair-Grounds have been enlarged to 147 acres, and a race-track made, at a cost of \$300,000. The number of steam railroads entering the city is 34, and of street-railways 14. One of these has a cable line $3\frac{1}{2}$ miles in length. In 1874-'75 there were 57 day-schools, with an average attendance of 24,438, and 21 evening-schools, with an average attendance of 2,644. In 1886 there were 89 day-schools, with an average attendance of 38,468, and 27 evening-schools. The expenditure for schools in the former year was \$792,019; in 1885 it was \$1,109,000. The number of churches has increased from 150 to 216. The trade in horses and mules exceeds that of any other city in the world, and the trade in hay that of any other in the country. St. Louis was made a port of entry under the act of 1870, permitting the shipment of foreign goods in bond to interior ports from the port of first delivery. The value of the direct importations under this act in 1873 was \$1,120,455; in 1874, \$843,313; in 1885, \$2,261,906. The following table shows the advance in the receipts and shipments of bread-stuffs:

ARTICLES.	RECEIPTS.		SHIPMENTS.	
	1874.	1885.	1874.	1885.
Flour, barrels.....	1,683,898	1,032,506	2,981,760	2,551,499
Wheat, bushels....	8,255,221	10,690,677	1,938,541	2,382,609
Corn, bushels.....	6,991,677	26,114,782	4,148,556	20,491,418
Oats, bushels.....	5,296,967	7,888,529	3,027,663	3,680,829
Rye, bushels.....	288,743	726,793	166,183	686,640
Barley, bushels.....	1,421,406	8,017,362	227,418	210,340

St. Louis is noted for the manufacture of flour, in which it is only surpassed by Minneapolis. The amount handled in 1885 was but little more than one half the capacity of the mills—a fact accounted for by the nearly total failure of the winter-wheat crop in the central belt of country from which the supply comes. In 1874 there were twenty-four mills in operation, and the production was 1,573,202 barrels. There are now twenty-seven, eleven outside the limits, with a total capacity of 6,000,000 barrels per annum, capital to the amount of \$2,500,000, and 1,500 employés. The following table shows the receipts and shipments of live-stock, meats, etc., at the two dates:

ITEMS.	RECEIPTS.		SHIPMENTS.	
	1874.	1885.	1874.	1885.
Cattle.....	860,92	836,329	226,675	283,249
Sheep.....	11,491	362,858	85,577	283,391
Hogs.....	1,126,54	1,455,535	453,710	789,487
Pork, barrels.....	51,43	6,632	90,943
Bacon and cut meat, pounds.....	52,104,88	75,319,861	183,486,880
Lard, pounds.....	6,877,56	8,956,536	27,112,210
Hams, pounds.....	6,184,179

The number of hogs packed in 1873-'74 was 463,793; in 1884-'85 it was 442,087. The cotton-trade is large. The receipts in 1874 were 155,943 bales; the shipments, 122,694 bales. The receipts for the year ending Aug. 31, 1886, were 472,640 bales. According to the census of 1870 the number of manufacturing establishments in the county, most of which were within the city, was 4,579; the capital invested, \$60,357,001; and the value of products, \$158,761,013. In 1880 the number of establishments in the city proper was 2,924; the capital, \$50,832,835; and the value of products, 114,333,375.

Saint Paul, a city and port of delivery, capital of the State of Minnesota and of Ramsey County, on both banks of Mississippi river, 2,200 miles from its mouth, 8 miles in a straight line, and 15 by the river, below the Falls of St. Anthony, and 409 miles northwest of Chicago; latitude $44^{\circ} 52' 46''$ north, longitude $93^{\circ} 5'$ west. The population was 12,976 in 1866; in 1875 it was 33,178; in 1880, 41,473; in 1886, estimated at 135,000. Its increase in population is due, in part, to annexation. In 1874 West St. Paul, on the opposite bank, was added, and in 1884 the suburban villages of Hamline, Merriam Park, Union Park, and Macalester. Thirteen railroads center here, and 191 passenger-trains arrive and depart daily. Regular lines of boats ply between the city and St. Louis. The river freightage for 1885 amounted to 70,000 tons. Among new buildings are a hotel that cost \$800,000; a city hall and court-house, \$1,000,000; a Chamber of Commerce, \$230,000; and a Government building of granite. Cable-car lines are in process of construction. Besides the public schools, there are Macalester College, Hamline University, St. Thomas Seminary, four medical colleges, and several parochial schools. St. Paul has a large wholesale trade; there are 412 houses employing 7,165 men, and doing an annual business of \$82,000,000. Its banking capital is \$7,898,885, and the annual exchange business amounts to \$121,000,000. The real-estate business is from \$13,000,000 to \$15,000,000 annually. The principal establishments are extensive stock-yards rivaling those of Kansas City; manufactures of agricultural implements, brass goods, stoves, clothing, lumber, machinery and mill supplies, carriages, brick and tile, sash, doors, and blinds, and boots and shoes. The shops of the Northern Pacific Railway are at St. Paul.

Salem, a city, port of entry, and one of the

shire towns of Essex County, Mass., on a peninsula between two arms of the sea called North and South rivers, and adjacent territory, 16 miles by rail northeast of Boston; latitude $42^{\circ} 31'$ north, longitude $70^{\circ} 53'$ west. The population in 1870 was 24,117; in 1880, 27,563; in 1885, 28,090. An improvement has been made on the North river by the filling up of a large basin thereby making a tract of new land for business purposes and improving sanitation. During the past three years, horse-car tracks have been extended to Marblehead, Danvers, North Beverly, and Wenham. Many new business blocks have been built. The number of pupils in the public schools has increased in ten years from 4,500 to 5,000. The Naumkeag Steam Cotton Company, which ten years ago had 1,438 looms, now has 2,700. Following are statistics of the leading manufactures for 1880:

MANUFACTURES.	Capital.	Value of products.
Leather, curried.....	\$708,050	\$8,589,511
Leather, tanned.....	452,500	2,396,684
Boots and shoes.....	98,000	789,650
Carpentering.....	20,150	185,655
Boot and shoe findings.....	16,250	107,800

The entire amount of capital invested in manufacturing in that year was \$8,978,850; the number of hands employed, 4,181; the total value of products, \$9,926,564. The number of persons employed in sea-fisheries the same year was 320, the amount of capital invested \$209,784, the catch of fresh fish 5,437,800 pounds. The total value of imports in the customs district of Salem and Beverly was \$9,216 in 1879, and \$27,832 in 1880; the value of exports, \$7,719 in 1879, and \$7,080 in 1880. The number of entrances in the foreign trade in 1880 was 96, tonnage, 8,905; clearances 106; tonnage, 10,256; entrances in the coastwise trade, 41; tonnage, 7,107; clearances, 7; tonnage, 1,931. Vessels enrolled in the district, 68; tonnage, 6,650.

San Antonio, a city, county-seat of Bexar County, Texas, on the San Antonio and San Pedro rivers, 75 miles southwest of Austin and 250 miles north by west of Brownsville; latitude $29^{\circ} 25'$ north, longitude $98^{\circ} 29'$ west. The population has risen within the last ten years from 12,256 to 39,991. There are 30 churches, 7 public and 17 private schools, 3 national banks, and 7 newspapers. The city has water-works, electric lights, and street-railroads. It is the principal city of western Texas, and has a large trade; it is entered by three railroads. The Pecos and Rio Grande Mining Company was chartered in 1882; capital stock, \$150,000; paid-up capital, \$100,000.

San Francisco, the chief city of California and the leading seaport of the Pacific coast of America, on a peninsula between San Francisco Bay and the Pacific Ocean; latitude $37^{\circ} 46'$ north, longitude $122^{\circ} 24'$ west. The population in 1870 was 149,473; in 1880, 233,859; in 1886, it was estimated at 301,773, of which

25,000 are Chinese. In 1875 there were 19,000 Chinese. The Chinese population have six large joss-houses, besides many smaller temples and private joss-chambers in the buildings of the various societies. There are several Christian missions in their quarter; the number of converts is 600, and the average attendance at the evening-schools where English is taught is 900. Two Chinese daily papers are published in the quarter. The only railroad terminating within the city is the northern division of the Southern Pacific, to meet the main line in Los Angeles County. Others connect by ferry. There are now ten lines of cable street-roads, and six more are projected. Six of these have been built within six years, and four of them extend to Golden Gate Park. Three climb steep hills inaccessible to carriages. The number of fares collected by the cable and horse railroads in 1885 was \$4,630,000. About 50 ocean-steamer run from the port in regular lines to Japan, China, Australia, the Sandwich Islands, and ports on the Pacific coast; and a large number of small steamers of light draught run to various points on the inland waters having outlets at the bay. The amount expended in new buildings in 1885 was \$7,143,999, an excess of \$5,389,564 over the amount expended in 1880. The number of pupils in the public schools in 1875 was 30,900; in 1885 it was 73,896. The number of books in the Mercantile Library has been increased in the same time from 40,000 to 56,000, that in the Mechanics' Institute Library from 25,000 to 42,000. The Free Library has 68,000. The number of academic institutions has risen from three to seven, the number of medical colleges from two to four, and the number of newspapers and periodicals from 75 to 100. The movement of business is westward on Market Street. Huge retail stores are found nearly as far out as the new City Hall, two miles from the old business center. A radical change has been made in business architecture within a few years. The dread of earthquakes is past, and most of the newer buildings are six and seven stories in height. The new City Hall, begun in 1871, is only partly finished. More than \$3,500,000 has been spent on it, and the estimated cost of completing it is \$4,500,000.

The mint has a capacity for coining 1,000,000 ounces a month. The Stock Exchange, which cost \$900,000, was built when the mining-stock excitement was at its height. The stock transactions have shrunk to small proportions, owing to the failure of the Comstock Silver-Mines. The merchandise exports by sea in 1874 were valued at \$27,000,000; in 1885, at \$35,360,430. In 1884 they had been \$37,238,836; in 1883, \$45,730,194; in 1882, \$55,218,674. The total exports of treasure by sea during 1885 amounted to \$19,955,082, against \$15,716,486 in 1884, and \$10,729,351 in 1883. The value of the exports by sea of important articles was as follows:

ARTICLES.	1874.	1885.
Wheat.....	\$14,000,000	\$16,145,515
Flour.....	2,900,000	5,216,198
Barley.....	289,000	244,100
Wines.....	600,000	629,279
Quicksilver.....	711,000	454,765
Salmon.....	909,100

In 1885, 93,160 centals of barley were sent by rail to Eastern cities, 10,000 flasks of quicksilver, 36,122,580 pounds of wool, 3,059,927 gallons of wine, and 87,500 packages of salmon. The overland merchandise exports for that year amounted to 226,421,000 pounds. The imports of merchandise in 1885 amounted to \$33,586,360. The imports of staple groceries by sea were as follow: Sugar, 185,634,285 pounds; tea, 6,783,784 pounds; rice, 33,871,951 pounds; coffee, 19,423,677 pounds. Of the sugar, 163,028,491 pounds were admitted free of duty from the Hawaiian Islands. The following figures also are given for 1885:

Coinage.....	\$23,508,869
Duties on imports.....	6,215,757
Internal revenue.....	1,783,432
Bank clearings.....	562,844,738
Treasure exports (including shipments by rail to New York).....	20,280,600
Treasure imports.....	9,840,446

The receipts of whale oil and bone for 1885 were the largest on record. Prior to 1879, comparatively few of the Arctic fleet came to San Francisco to discharge, most of them reporting at Honolulu. The number of vessels reporting at San Francisco, in 1874, was 11; in 1876, 7; in 1879, 22; in 1885, 43. For the ten years prior to 1884 the receipts of whale-oil at San Francisco amounted to 114,711 barrels, the largest quantity for any one year being 18,940 barrels. The receipts for 1885 were 30,143 barrels of oil and 448,075 pounds of bone; ivory, 7,066 pounds. Considerable capital is invested in the cod-fisheries in Okhotsk and Bering Seas, and among the Choumagin islands on the coast of Alaska. The number of vessels and the catch for several years are reported below:

YEAR.	No. of vessels.	Fish.
1870.....	21	1,265,500
1875.....	7	504,000
1880.....	8	1,106,000
1883.....	16	1,750,000
1885.....	14	1,874,000

Among the manufactures established within ten years, the most important is the Union Iron-Works at South San Francisco, where are facilities for ship-building equal to any in the country. The materials can be turned out and a man-of-war built with all the latest improvements. Others are the new woolen-mill at Black Point; a large sugar-refinery with improved machinery; a new flour-mill; a whale-oil refinery that works up the entire product from the Pacific coast whaling fleet; wire-works, cable-works that produce the enormous street cables formerly imported from Europe; a cracker-factory, and gas-works. Great prog-

ress has also been made in the manufacture of shirts, boots and shoes, jewelry, artificial stone, cigars, and clothing. The city has had a monopoly of the manufacture of heavy mining machinery. During 1885-'86 an effort was made to supplant the Chinese cigar-makers with white help from Eastern cities, but it failed. The latest addition to the industries is the glass-works, having the most complete machinery west of Pittsburg, and a capacity of eight tons of glassware daily. Several large canneries have been established within ten years, as well as packing establishments for raisins and wineries. The Water-Works Company has begun work on a new dam to be 160 feet high, which will require three years to finish, and will make a reservoir with a capacity of 40 thousand million gallons.

Savannah, a city, capital of Chatham County, Ga., on the right bank of Savannah river, 18 miles from its mouth, and 104 miles by rail southwest of Charleston; latitude $32^{\circ} 5'$ north, longitude $81^{\circ} 8'$ west. The population in 1875 was estimated at 28,235; in 1880 it was 30,709; in 1885, according to local census, 45,000. The depth of the river is being gradually increased by engineering operations at the expense of the General Government, facilitating the ascent of vessels of heavy burden to the city wharves. The chief business is the receipt and shipment of cotton, though the trade in lumber, rice, and naval stores is large. The commerce is growing rapidly, the railroads bringing freight from the interior to connecting lines of steamships. A permanent home for the Georgia Historical Society has been secured, and an Academy of Arts and Sciences established.

Scranton, a city of Lackawanna County, Pa., 167 miles by rail north by west of Philadelphia, and 145 miles from New York; latitude $41^{\circ} 24'$ north, longitude $75^{\circ} 48'$ west. The population in 1870 was 35,092; in 1880, 45,850; in 1885, estimated at 70,350. Scranton has grown up since 1840. A fine court-house has just been finished at a cost of about \$250,000 for the building. A jail to cost about \$200,000 is nearly completed. There are two Bessemer steel-rail mills, two silk-mills, and several car- and machine-shops. An electric street-railway is in process of construction. Four railroads enter the city, and two more are soon to be brought within the limits. Following are statistics of the principal manufactures for 1880:

MANUFACTURES.	Capital.	Value of products.
Iron and steel.....	\$2,294,000	\$5,400,085
Foundry and machine-shop products.....	902,000	630,190
Flouring- and grist-mill products.....	185,000	291,287
Liquors, malt.....	170,000	133,125

The whole amount of capital invested in manufacturing was \$4,470,631; the number employed, 3,549; the total value of products, \$8,561,850.

Somerville, a city of Middlesex County, Mass., on Mystic river, two miles northwest of Bos-

ton; latitude $42^{\circ} 32'$ north, longitude $71^{\circ} 5'$ west. The population in 1870 was 14,685; in 1880, 24,933; in 1885, estimated at 29,992. It was made a city in 1872. About 20 acres of flats and marsh, in part the bed of Miller's river, were filled up in 1878-'80. Four lines of railroad touch the city. There are 4 lines of street-railroads, 28 churches, 28 school-buildings, 2 banks, and a newspaper. Following are statistics of the principal industries for 1880:

INDUSTRIES.	Capital.	Value of products.
Slaughtering and meat-packing.....	\$760,840	\$8,702,601
Flouring- and grist-mills.....	29,200	111,400

The whole amount of capital invested in manufacturing was \$1,682,795; the number employed, 1,296; and the entire value of products, \$5,852,535. The total valuation of property was \$18,590,100.

Syracuse, a city, capital of Onondaga County, N. Y., at the head of Onondaga Lake and on Onondaga creek, 147 miles west by north of Albany, and 151 miles east of Buffalo; latitude $43^{\circ} 2'$ north, longitude $76^{\circ} 14'$ west. The population in 1870 was 43,051; in 1880, 51,792; in 1886, 78,323. The increase during the latter period is partly due to the annexation of the suburbs, Geddes and Danforth. The new park given to the city, containing 100 acres of rolling land, will be laid out at once. The Syracuse Savings-Bank has a fine building, the cost of which was \$300,000, and the Onondaga County Savings-Bank a still finer one. The Government is erecting a post-office and court-house building of stone to cost \$350,000. The new St. Mary's Church will cost about \$200,000. St. Paul's Cathedral has just been built, at an expense of nearly \$100,000. Four daily newspapers have a circulation of 28,000. The Young Men's Christian Association, of 600 members, has just completed a five-story building at a cost of \$60,000, containing reading and reception-rooms, a gymnasium, and a concert-hall. Syracuse is an important railroad center, 53 passenger and a larger number of freight-trains depart daily from the depot, while the freight-trains of the New York Central pass around the city. The freight shipped by rail in 1885 was about 800,000 tons, and the amount received about 850,000 tons. The Erie and Oswego Canals contribute greatly to the trade of the city. During the year 1885 there were cleared from the port 3,648,193 feet of lumber, 420,886 pounds of bacon, 482,699 barrels of flour, 350,131 bushels of grain and malt, 7,488,102 pounds of bran and ship stuff, 16,403 barrels of apples, 42,598 barrels of potatoes, 279,281,434 pounds of salt, and considerable other raw and manufactured products, including tobacco, gypsum, hops, and dairy produce, the total tonnage being estimated at 1,200,000 tons. In manufacturing industries that of salt has always been prominent in Syracuse. In 1874,

6,029,300 bushels were made; in 1885, 6,934,299. The whole amount made from the time when the State took charge of the springs in 1797 to the close of 1885 is 320,319,886 bushels. The value of other articles manufactured in 1874 was estimated at about \$14,000,000. Following are statistics of the principal manufactures in 1880:

MANUFACTURES.	Capital.	Value of products.
Clothing, men's	\$918,800	\$2,542,483
Tobacco, cigars, and cigarettes	256,830	847,093
Foundry and machine-shop products	608,300	656,831
Flouring- and grist-mill products	149,000	644,065
Salt	1,106,581	626,187
Salt, ground	229,200	266,906
Slaughtering and meat-packing	221,000	620,918
Liquors, malt	589,497	586,295
Carpentering	77,200	515,750
Boots and shoes	96,775	495,582
Carriages and wagons	125,600	825,574

The whole amount of capital invested in manufacturing industries at that time was \$8,186,818; the number employed, 10,966; and the total value of products, \$14,695,674. There are now 14 iron manufacturing companies, a milk association, 2 large and 7 small breweries, and manufactories of shoes, agricultural implements, pottery, and powder, which turn out annually a product valued at \$6,000,000, and employ 3,000 workmen. The value of manufactured articles produced by other establishments, not incorporated, is placed at \$16,000,000. The wholesale trade of the city amounts to \$15,000,000 yearly, and the retail to \$25,000,000. The entire trade of the city, including manufactured products of all kinds, is about \$70,000,000. The manufacture of soda from salt is carried on at the rate of 15,000 tons yearly, the amount of capital invested being \$600,000. There are more than 3,000 business concerns in the city.

Taunton, a city, and one of the shire towns, of Bristol County, Mass., at the head of navigation on Taunton river, 24 miles from Narragansett Bay, and 34 miles, by rail, south of Boston; latitude $41^{\circ} 54'$ north, longitude $71^{\circ} 6'$ west. The population in 1870 was 18,629; in 1880, 21,213; in 1885, 23,674. It is on the Old Colony Railroad, has an important coasting-trade, and is noted for its herring-fisheries. There are eight cotton-factories. Other articles manufactured are iron products and brick and tile. More tacks and small nails are made in Taunton than in any other place in the world, and two fifths of all the shoe-buttons used in the United States are made there. The table below shows the statistics of the principal manufactures in 1880:

MANUFACTURES.	Capital.	Value of products.
Cotton goods	\$690,000	\$1,856,881
Foundry and machine-shop products	1,099,300	1,725,826
Iron nails and spikes, cut and wrought	560,000	998,375
Brick and tile	207,100	145,792
Flouring- and grist-mill products	28,500	161,922

The entire capital invested in manufacturing industries was \$4,086,134; the number employed, 5,154; the total value of products, \$7,618,953.

Toledo, a city and port of entry, capital of Lucas County, Ohio, on the Maumee river, 5 miles from its mouth in Maumee Bay, and 8 miles from the western extremity of Lake Erie. Its population was 31,584 in 1875; in 1880, 50,137; in 1886, 76,000. The city has communication by fifteen or more railroads, the Miami Canal, and the lakes. The shipping has increased so far as to outgrow the old channel to the lake, and a Government appropriation of \$110,000 has been made to begin work on a new, straight channel, the entire estimated cost of which is \$3,000,000. Toledo has a very large trade in grain. Its receipts of iron-ore for 1885 amounted to 51,000 tons, and of coal, 2,092,421 tons, a falling off from former years in consequence of labor disturbances and depression in the iron business. The receipts of lumber, shingles, etc., for the same year amounted to 400,000,000 feet. The recent discovery of natural gas and oil in immense quantities in northwestern Ohio promises to give Toledo greatly increased facilities for manufacture. A company has been incorporated having a franchise from the city, open to all competitors, for furnishing natural gas to Toledo from points nearer by more than half than the nearest points to Pittsburg. This company owns the largest producing gas-well yet bored, about 26 miles from Toledo, and has secured other great wells. Other companies have been formed, and are experimenting in the vicinity. The official statistics of manufactures for 1883 show an increase of nearly double over the census figures of 1880. The number of establishments in 1883 was 642, the capital invested, \$12,000,000; the number employed, 11,804; the value of products, \$23,300,000. These represent 117 classes. In the same year 24 new companies were organized, representing large railroad and manufacturing interests. The production of beer and native wines is very large. Toledo has a manual training-school as part of its high-school course. The first lunatic asylum built in Ohio under the cottage system is here, and has 34 buildings in all, erected at a cost of \$300,000, not including the cost of the grounds. It has also a fine memorial hall to the fallen soldiers of the civil war.

Topeka, a city, capital of Kansas and of Shawnee County, on both sides, mostly the south side, of Kaw or Kansas river, 65 miles west of Kansas City, 45 miles southwest of Leavenworth, and 300 miles west of St. Louis. The population in 1875 was 7,272; in 1880 it was 15,452; in 1886, including the suburbs, it was 32,106. It is on 4 railroads, 2 of which were completed in 1886. There are about 7 miles of horse-railway, and a company is organized to build and operate a cable-road on the principal streets. The city has 23 church-buildings; 4

daily, and 22 weekly, monthly, and quarterly publications, and a free library of over 6,000 volumes. The State Art Association is located here. Besides public and parochial schools, Topeka has business colleges, Bethany College for girls, and Washburn College for both sexes. The State Reform School is here also. The Government has built a post-office and courthouse, and the central portion of the State-House, of which one wing was finished in 1867 and the other in 1882, is now in process of erection. The shops of the Atchison, Topeka, and Santa Fé Railroad Company, where locomotives, cars, and all kinds of railroad machinery and tools are made, are here. There are also five large flouring-mills, several foundries, planing-mills, and factories for making agricultural implements and sash and doors, and other smaller manufacturing establishments.

Troy, a city, capital of Rensselaer County, N. Y., on the east bank of Hudson river, at the head of steamboat navigation and of tide-water, 151 miles by the river north of New York city, and 6 miles north of Albany; latitude $42^{\circ} 44'$ north, longitude $73^{\circ} 41'$ west. The population in 1870 was 46,465; in 1880, 56,747. It is entered by 4 railroads. The iron industries of Troy are very important. In 1880 there were 36 iron and steel working establishments and machine-shops. Two new blast-furnaces are now in process of erection, and the Bessemer Steel-Works have been enlarged and remodeled. Horseshoes are made to an extent unequalled elsewhere. The Troy Car-Works are at Green Island, on the opposite side of the river. The annual product of the shirt and collar business is now valued at \$10,000,000; the pay-rolls of some establishments amount to \$1,000 a day each. The largest manufacture of mathematical instruments in the country is here, and one of the largest globe manufacturers. The following table gives the statistics of some of the principal industries for 1880:

MANUFACTURES.	Capital.	Value of products.
Iron and steel.....	\$4,550,000	\$8,702,189
Foundry and machine-shop products.....	2,423,700	3,228,848
Shirts.....	874,000	2,919,591
Furnishing goods, men's.....	830,000	2,636,614
Liquors, malt.....	809,750	895,889
Clothing, men's.....	210,550	654,436
Paper.....	525,465	546,828
Tobacco, cigars, and cigarettes.....	163,025	406,661
Hosiery and knit goods.....	144,000	391,390
Flouring- and grist-mill products.....	183,200	367,855
Bread and other bakery products.....	73,200	358,013
Printing and publishing.....	245,888	810,700
Carpentering.....	48,300	807,533
Slaughtering and meat-packing.....	98,000	259,161

The entire amount of capital invested in manufacturing was \$13,418,853; the number employed, 22,434; and the total value of products, \$26,497,163.

Utica, a city, and one of the capitals of Oneida County, N. Y., on the south bank of Mohawk river, 96 miles by rail west-northwest of Albany; latitude $43^{\circ} 5'$ north, longitude $75^{\circ} 13'$ west. The population in 1870 was 28,804;

in 1880, 33,914; by local enumeration in 1885, 39,529. It is on the Erie Canal and New York Central and West Shore Railroads, and has communication northward and southward by other railroads. There are many newspapers, three of which are daily, and 34 public schools; the attendance in all schools averaged 3,727 in 1880. The city has a large trade in the products of the surrounding country, Oneida county standing third in the Union in 1880 in the value of its farm-products. Utica is the buying and shipping point for a large dairy country in which there are many cheese-factories. Hops also are largely grown. Following are statistics of some of the principal manufacturing industries for 1880:

MANUFACTURES.	Capital.	Value of products.
Clothing, men's.....	\$981,300	\$2,256,875
Boots and shoes.....	557,600	1,125,724
Foundry and machine-shop products.....	589,300	637,721
Sash, doors, and blinds.....	136,000	305,078
Tobacco, cigars, and cigarettes.....	882,500	301,065
Liquors, malt.....	160,660	219,000
Printing and publishing.....	216,500	197,007

The whole amount of capital invested in manufacturing was \$5,905,635; the number employed, 6,710; the total value of products, \$8,873,306.

Watertown, a city, capital of Jefferson County, N. Y., on both sides of Black river, 7 miles above its mouth on Lake Ontario, 145 miles northwest of Albany; latitude $43^{\circ} 58'$ north, longitude $75^{\circ} 54'$ west. The population in 1870 was 9,336; in 1880, 10,697; in 1885, 12,219. There are 12 churches, 9 graded schools, with nearly 2,000 pupils, one daily and four weekly newspapers. Watertown has a large post-office business for a city of its size —\$25,000 a year; it is said to be the smallest city having a postal-carrier system. A new State Armory and a new County Clerk's Office cost each \$25,000. A fine opera-house has recently been built and the "Henry Keep Home" for aged people, the gift of private charity; it has accommodations for 65 inmates and a farm of 35 acres; the building cost \$26,000. A two-mile boulevard leading to the cemetery has been completed, at a cost of \$10,000. Watertown is the center of a rich agricultural region, the dairy interest predominating. Transportation facilities are afforded by two railroads and branches. The manufactures are aided by the water-power afforded by the river, which has a fall of 112 feet within the city. Fully one third of the population are supported by these industries. Among the leading ones are the manufacture of sewing-machines, paper, wagons and buggies, steam-engines, Hitchcock lamps, vacuum-brakes, thermometers, saddlery, foundry and machine-shop products. About 25 tons of paper are made in a day. Pulp is made from spruce, to be used in the manufacture of paper. About 7,000 wagons are made in a year, 35,000 sewing-machines, and 50,000 expensive

metal lamps with clock-work interiors. A factory for manufacturing printing-presses on a large scale has just been established. There are four national banks with an aggregate capital and surplus of about \$715,000, and one savings-bank with deposits of \$1,141,558.

Wichita, a city, capital of Sedgwick County, Kansas, on Big and Little Arkansas rivers, in the southwestern part of the State, 50 miles north of the boundary-line between Kansas and Indian Territory. The town was laid out in 1870, and organized in 1871 with a population of 500. The enumeration of 1886 showed a population of 25,000, making it the third city in the State. There are 14 churches, 6 schools with 3,800 pupils, an academy, a college, a court-house, and an opera-house with a seating capacity of 700. Six railroads enter the city, and 5 others are in process of construction. There are 7 banks, with an aggregate capital of \$2,000,000; clearances, \$500,000 a week. Chief exports are flour, corn-meal, wheat, corn, cattle, horses, mules, hogs, sheep, dairy products, vegetables, and fruits. The 5 flouring-mills turn out 650 barrels of flour a day. The 5 grain-elevators handle nearly 2,000,000 bushels of grain a year. There are 3 foundries and machine-shops, and 2 carriage and wagon works. \$2,300,000 has recently been expended in new buildings, a public park, a fair-ground, water-works, a street-railway, and other improvements.

Wilkesbarre, a city, capital of Luzerne County, Pa., on the North branch of Susquehanna river, about 100 miles north by west of Philadelphia; latitude 41° 14' north, longitude 75° 56' west. The population in 1870 was 10,174; in 1880, 23,339; in 1886 it was estimated at 32,000. It has communication by 5 railroads, and 2 lines of steamers ply between it and Nanticoke, 9 miles below. The growth and prosperity of the city are due mainly to the coal-mining interests. Local industries and trade are chiefly confined to coal and mine and railway supplies, such as lumber, powder, cars and mining implements. Axe-works have recently been established, and lace and silk factories. In 1880 the whole amount of capital invested in manufacturing was \$1,146,500, the number employed 645, and the total value of products \$1,133,344, of which \$297,660 was of foundry and machine-shop products.

Wilmington, a city and port of entry, capital of New Castle County, Del., the chief city of the State, at the confluence of Christiana and Brandywine creeks, 28 miles southwest of Philadelphia; latitude 39° 44' north, longitude 75° 33' west. The limits extend to the Delaware river. The population was 30,841 in 1870; 42,478 in 1880; in 1886 it was estimated at 52,000. Four railroads enter the city; the Baltimore and Philadelphia has an iron bridge over the Brandywine. There are 23 public schools. A court-house was built in 1880, and the courts and records were removed from New Castle in 1881. The banking capi-

tal has been increased \$210,000 within a year. There are 2 savings and 6 other banks, 1 safe-deposit and trust-company, and 2 banking-houses. The Christiana is navigable for vessels drawing 14 feet, and the Brandywine for vessels of 7 feet draught, and wharves extend 6 miles along the two creeks. The total value of imports in 1879 was \$24,076, of exports \$35,467; the value of imports in 1880 was \$7,738, of exports \$270,309. The number of vessels registered, enrolled, and licensed in the district in 1880 was 182, with tonnage of 16,287. The Brandywine has a fall of 120 feet within 4 miles of the city, and mills and factories are placed along its banks. Several old flouring-mills have recently been removed, and new ones built in their places with improved machinery. The match-factories have been enlarged, the car-wheel works have been removed outside the city line and increased in capacity; new rolling-mills have been built and old ones enlarged. Several new morocco-factories have been erected, and another is in process of building. The ship-yards and car-shops also have been enlarged. New enterprises are pulp-works and a fiber company. Following are some statistics of industries for 1880:

MANUFACTURES.	Capital.	Value of products.
Iron and steel	\$1,109,469	\$2,004,570
Ship-building.....	905,500	1,974,298
Leather, dressed skins.....	861,500	1,801,597
Paper.....	2,448,000	682,905
Foundry and machine-shop products.....	755,800	671,125
Cotton goods.....	885,000	645,460
Carriages and wagons.....	415,270	479,067

The whole amount of capital invested in manufactures was \$10,744,389, the number employed 7,852, and the total value of products \$13,205,370.

COLOMBIA, an independent republic of South America. The new Constitution of Aug. 5, 1886, deprives seven of the nine sovereign States of the character of members of a confederacy, and converts them into as many provinces, to be ruled each by a governor. It also reduces two of them, Panamá and Cundinamarca, to the condition of territories or national departments, under governors appointed by the President. The republic is consequently now composed of seven provinces and twelve territories. It covers an area of 586,000 square miles, and has a population of 3,500,000, including 50,000 wild Indians.

Government.—The President of the Republic is Dr. D. Rafael Nuñez, re-elected for six years, from December, 1885. The Vice-President is Gen. Eliseo Payan. The Cabinet was composed of the following ministers: Secretary of State and Minister of War, Dr. Don Felipe Angulo; Finance, Dr. Don Antonio Roldan; Secretary of the Treasury, Don Jorge Holguin; Minister of Public Instruction, Dr. Don Domingo Ospina Camacho; Public Works, Dr. Don Felipe F. Paul; Interior, Dr. Don Aristides

COLOMBIA.

Calderon; and Foreign Affairs, Dr. Don Vicente Restrepo. The United States Minister at Bogotá is Hon. Dabney H. Maury; and the Colombian Minister at Washington, Don Ricardo Becerra. The Colombian Consul at New York is Señor C. Calderon; and the American Consul at Panamá, T. Adamson.

Army and Navy.—The strength of the army in 1886 was 3,000 on a peace footing, to be increased in time of war or insurrection by a contingent of 1 per cent. of the population.

The navy consists of the recently plated war-steamer "Boyacá," a steam-yacht, "Rafael Núñez," built in the United States in 1883, and a coasting-steamer.

Finance.—The public indebtedness, on Dec. 31, 1884, was represented by a foreign debt of \$11,000,000, and a home debt of \$15,000,000. The income of the Government during the fiscal year 1883-'84 was \$5,155,000, and the outlay \$4,000,000, leaving a surplus of \$1,155,000. The amount of national-bank notes in circulation in January, 1886, was by decree reduced to \$1,500,000, small nickel coin to take the place of the notes withdrawn and canceled. In a message to the Assembly of Delegates, March 31, President Núñez said he was able to negotiate a 6 per cent. Government loan in London to the amount of £2,500,000, and asked for authority to conclude it. He added that two years' interest would have to be advanced by him, and that 1 per cent. would have to be set aside toward the sinking-fund of the loan, the republic to pledge for the payment of the loan the rights secured it by the Panamá Canal Company, besides a certain percentage of revenue from customs.

Monopoly.—The Government farmed out to a private syndicate of merchants the monopoly of importing alcoholic beverages into Colombia, for an annual rental of \$300,000. The monopoly does not include either wine or beer.

During the summer, rich placer gold-mines were discovered at Bucaramanga and in other localities of the province of Santander.

Railroads.—In addition to the 142 miles of railroad in operation, there is a project on foot for building a line across the republic from the Atlantic to the Pacific.

The gross earnings of the Panamá Railroad in 1885 were \$3,267,922; operating expenses, \$2,655,272; net earnings, \$612,650; interest, \$541,041; balance, \$71,609. The treasurer's statement of Dec. 31, 1884, showed a surplus of \$1,076,557, out of which a 10 per cent. dividend was paid, amounting to \$700,000, leaving on hand, in December, 1885, \$448,166.

Telegraphs.—No sooner was the country pacified than a new line of telegraph was added to the 2,376 miles then in operation, bringing into direct communication the provinces of Antioquia and Cauca by connecting Manizales with Cartago, a line very much needed on account of the large trade in cattle, cocoa, salt, etc., carried on in that region.

New Ports.—By decree of the President, dated

at Bogotá, July 5, 1886, the ports of Arauca and Orocué were thrown open to commerce as ports of entry and export. They are on the banks of the Casanare, a tributary of the Orinoco. The import duty is the same as per general tariff, less 40 per cent., but with the additional 25 per cent. war duty.

Tariff.—The new tariff became operative on Oct. 1, 1886, the duties ranging from one cent to \$1.20 the kilogramme. The free list includes articles for the use of the Government, property of the representatives of other Governments, and the natural productions of such countries as may enter into reciprocal treaties. All articles not enumerated are dutiable at the highest rate—namely, \$1.20 per kilogramme. The importation of money of inferior standard is prohibited, as is also machinery for making money, arms, and munitions of war. Machinery exceeding 1,000 kilogrammes in weight pays one cent. per kilogramme; not exceeding 1,000 kilogrammes, it pays five cents.

Extra Duties.—The extra import duty of 15 per cent. on goods consumed in the province of Bolívar since 1878 was, on Jan. 1, 1886, reduced to 10 per cent.; but efforts since made to abolish it altogether have failed to receive the consent of the Central Government at Bogotá. On the other hand, the extra 50 per cent. levied on internal taxes paid in the same province as a war-tax has been abolished.

The Government has received proposals from a New York merchant, who asks for a concession to remove the bar obstructing the entrance of vessels at Barranquilla into Magdalena river. No Government aid is to be extended to the enterprise, which proposes to be allowed to levy tonnage-dues for the improvement.

New Steamship Line.—In September the new line of the French Transatlantic Steamship Company was established from Marseilles. One of the steamers is to call monthly at Barranquilla via Italian and Spanish ports, the ports touched at being Genoa, Naples, Cadiz, Teneriffe, Port de France, Trinidad, Barcelona, La Guayra, Barranquilla, and Colon.

Commerce.—The following tabular statement shows Colombian trade with some of the leading commercial countries:

FROM COLOMBIA INTO—

YEAR.	United States.	England.	France.
1881	\$5,991,890	\$6,677,505	\$5,016,006
1882	4,961,470	5,452,281	5,893,696
1883	5,171,455	8,809,798	4,188,336
1884	8,891,543	2,105,533	4,283,606

TO COLOMBIA FROM—

YEAR.	United States.	England.	France.
1881	\$5,383,183	\$5,999,776	\$6,214,845
1882	6,405,346	5,296,660	5,959,846
1883	6,563,971	6,099,414	5,954,852
1884	6,881,821	5,944,571	7,169,408

The United States trade with Colombia in two years has been:

FISCAL YEAR—	Imports from Colombia into the United States.	Domestic exports from the United States to Colombia.
1886.....	\$3,008,921	\$5,294,798
1885.....	2,342,077	5,397,412

The Panama Canal.—M. Ferdinand de Lesseps, President of the Universal Inter-oceanic Panama Canal Company, by letter dated Paris, January 11, asked the President of the New York Chamber of Commerce, James M. Brown, to appoint a delegate or delegates to accompany him on his voyage to Panama, where he intended to begin the period of final execution of the maritime canal, a similar request having been addressed to the Chambers of Commerce of France. He added that delegates from England and Germany would join the French representatives. The invitation was accepted, and John Bigelow, of New York, was appointed as delegate. M. de Lesseps arrived at Colon on February 17. Some months previously he had applied to M. Brisson, then Prime Minister of France, for the Government sanction, necessary, according to French law, before lottery bonds can be issued by a company. The amount that M. de Lesseps desired to raise in this way was 600,000,000 francs. The Government sent out a commission composed of eminent engineers to make a thorough inspection of the work, the four gentlemen composing it being M. Armand Rousseau, Special Commissioner, Inspecteur-Général des Ponts et Chaussées; Chief-Engineer M. Jaquet; Ingénieur Luys, and Major de la Semette. Having concluded their labors, they arrived at New York on February 20 on their return to France *via* Canada.

Mr. Bigelow accompanied M. de Lesseps and party to La Boca, on the Pacific side, returning to New York early in March, about the time of M. de Lesseps's departure for France. On June 27 the committee elected by the French Chamber of Deputies to report on the bill proposed by the Minister of Public Works, authorizing the Panama Canal Company to issue a lottery loan of 600,000,000 francs, met and elected M. Germain Casse president of the committee, and M. Compayre, Secretary. Both these gentlemen were decidedly averse to the project; in fact, out of eleven members composing the committee, eight were strongly against the bill, two favorable under certain conditions, and but one unconditionally so. Simultaneously the report of M. Rousseau was distributed to the members of the Chamber. Its conclusions were, that the canal is a possible undertaking; that it is now carried to such a point that its abandonment can not be thought of, as such a course would bring disaster not only to the share-holders of the company, who are nearly all Frenchmen, but also to French influence in America; that it is evident that, if the enterprise were allowed to fail, it would be immediately taken up by a foreign company, which would reap the credit and profit from it. But

the Government has no control over the plans and contracts of the company, and ought to give no guarantee of any kind to the company. M. Rousseau concluded the report by declaring that the completion of the canal, with the financial means and limit of time calculated by M. de Lesseps, seems to him more than problematical, unless the company makes important alterations in its present plans. When the committee asked that contracts should be produced in order that it might examine them, M. de Lesseps refused to show them. The Government therupon withdrew the Panama Canal Lottery Loan bill from the Chamber of Deputies.

Meanwhile, April 16, Mr. Bigelow had presented to the New York Chamber of Commerce his report, in which he says:

All the conditions under which this work is to be conducted are peculiar and exceptional. It is in a foreign state, under a weak and unsettled government, in one of the most unhealthy regions on the continent, subject to earthquakes, within 450 miles of the equator, and under a tropical sun, where acclimated laborers only are of any service. Should they not increase the present average, it will take from ten to fifteen years to finish their contract, even should they suffer no unforeseen delays or interruptions. It certainly is not progressing at present at a rate which warrants the hope of its completion in 1889.

On July 29 a meeting of the Panama Canal Company was held at Paris. M. de Lesseps read a voluminous report, in which he said there is not a section of the canal which is not contracted for, and that the sanitary condition is satisfactory. During the past year the mortality was 5½ per cent, not more than the average mortality on public works in Europe. The report cited statements of M. Levasseur and the Americans—Admiral Davis and Engineer Kelly—and the Dutch engineer of the Vannehus estates, to prove that the receipts will amply suffice to pay large interest on all the capital—probably 6 or 7 per cent. on a capital of two milliard francs or, in other words, do a traffic of 7,250,000 tons, and earn therefrom a revenue of 108,000,000 francs.

M. de Lesseps pledged himself to open the canal in 1889, within the cost estimated by the Congress of 1879.

The aggregate expenditure, during the fiscal year 1884-'85, was 141,852,777 francs, and, as in former years, since the incorporation of the company, there had been spent 354,009,199 francs, the total amount reached, on June 30, the sum of 495,862,076 francs. But there is to be deducted from it the sum of 24,729,260 francs not yet paid, reducing the actual disbursements to 471,132,816 francs. Deducting the latter from the share capital of the company, the 250,000 bonds of 1882, the 3 per cent. bonds of 1883, and the 341,292, 4 per cent. bonds of 1884—together, 713,104,368 francs—there remained on June 30, 1885, the sum of 241,971,552 francs. The new 6 per cent. loan was for the time being limited to 225,000,000 francs, and placed on the market during the last week of July by all the French

banking institutions, except the Crédit Foncier de France, at between 440 and 450 francs per bond of 1,000 francs. Every two months a drawing is to take place during forty-two consecutive years, the winning numbers to be paid in full the nominal value of the bonds of 1,000 francs, 6,000 bonds to be thus drawn during the first year. The fluctuations in the value of 5 per cent. Panama Canal bonds on the Paris Bourse had been : January, 1885, 390 ; October, 383 ; January, 1886, 372 ; June, 30, 380 ; July, 1, 367, and July, 12, 310. On September 20 the last installment was called on 500 francs Panama Canal shares.

Out of the 458,802 new bonds negotiated in August, 1886, 200,000 were paid at once, 26,000 shortly afterward; in October, 230,000 more had been paid.

Arbitration.—The difficulty that had existed for some years between Colombia and Costa Rica, about their frontier, was submitted in September to the arbitration of Spain.

During the insurrection of 1885 an Italian merchant, Signor Cerruti, was imprisoned because he had espoused the cause of one of the rebel pretenders. The commander of the Italian man-of-war "Flavio Gioja" interfered in the matter, threatening the port of Buenaventura on the Pacific with bombardment if Cerruti were not handed over to him. The demand was complied with; but when he landed at Panamá and was about to take passage on board the steamer "Ilo," he was thrown into prison by the Colombian authorities. Meanwhile all his property in the province of Cauca had been confiscated by the Government. Italy had dispatched several men-of-war to Colombian waters, and the complication was assuming a threatening aspect, when a protocol was signed between the Italian ambassador at Paris, and the Colombian ambassador, laying down the bases of an agreement, which has been submitted to the arbitration of Spain.

Bogotá, a city founded in 1542, and once called Santa Fé de Bogotá, capital of the United States of Colombia and of the State of Cundinamarca; population 100,000. It is situated in latitude $4^{\circ} 36' 06''$ north, longitude $74^{\circ} 18' 59''$ west, 8,870 feet above the level of the sea. It is built on a plateau of the Andes, 80 miles from the mouth of Magdalena river, and at the base of high mountains at the extreme eastern side of the great plain of Bogotá. The temperature ranges from 52° to 62° F., summer and winter. The showers that fall from a cloudless sky are called *para mitos*, and blow over from the barren plains in the rear of the mountains, where, in summer, rain is constantly falling. The gardens abound in heliotropes, rhododendrons, fuchsias, violets, and an infinite variety of flowers which bloom perennially. The exports consist of gold, silver, copper, platinum, tobacco, bark, coffee, dye-wood, cocoanuts, rubber, hats, and other articles. Emeralds of the finest luster and the greatest value are found. All freight is transported on the backs of mules

from the mouth of Magdalena river, 27 Spanish leagues, over the mountains, by a rough, winding, steep, and narrow road, which in some places is worn deep into the sandstone rock. Pianos, the freight on which is \$1,000, are common in the houses. The streets are without vehicles, except street-cars drawn by mules. The town is built principally of adobe houses, with elegant interiors, reached through court-yards tastefully laid out in flower-gardens. The buildings, mostly ancient, are rarely more than two stories in height, with the exception of the convents and churches. They are unpainted, and at a distance the city is almost invisible. They are roofed with tiles, and have low, dark portals, true specimens of Spanish architecture, being built in the form of a square inclosing the court-yard and garden. The streets, forming at intervals the sides of plazas, are narrow, paved with cobblestones, and have a ditch running through the middle, for drainage, rendering it impossible for carriages or carts to pass through them. The common people wash their clothes in these drains. Pipes supply clear water from the sides of the buildings at the corners of the plazas, fed by a reservoir a few miles from the city. The water is carried in jars from these pipes to the houses on the backs of women. The streets are lighted by gas. There is no residence quarter, so called, fine residences and hovels confronting each other indiscriminately. On one side of the Grand Plaza, occupying the center of the city, are the cathedral and postal buildings; on the other sides the President's Palace and Government houses. In the square is a statue of Bolívar, Liberator of Colombia, in bronze, mounted on a large square pedestal composed of various colored stones sent from the several States of the Republic, on which are cut the names of his battles. It was executed in Italy at the expense of a private individual. The cathedral is 300 feet long and 100 feet wide, and is noted for its magnificent decorations and paintings brought here by the Spaniards. There are 37 churches, two of them situated 1,500 feet above the city, on the highest mountains. The popular religion is Roman Catholic, but there is no religion of state. There are 400 resident priests. The President of the Republic resides in the Government Palace. The Senate holds its sessions in the Convent of Santo Domingo, which also accommodates the State, Treasury, and War Departments. The Senate-chamber is large and finely furnished. Above the President's chair are the arms of Colombia. On the walls are life-sized portraits of Bolívar and Santander. The sessions of the Representatives are held in an old Jesuit college, in a hall inferior to the Senate-chamber, but ample and suitable. The Opera-House is furnished with boxes extending in two tiers entirely around the house, with the stage in the center. The market is a conspicuous building, and has on sale the vegetables and fruits of two zones, torrid and temperate.

Fish, crabs, and shrimps are sold in little netted bags. The necessaries of life, although brought here at great expense, are cheaper than at the coast. There are no printed signs over the doors, as the natives can not read; but, instead, are animals painted in large proportions. Hundreds of mendicants lounge in the streets. The police regulations are very strict, the men, on duty by night only, being signaled by a bell to change their posts at the corners of the streets every fifteen minutes. They are armed with lassoes and short bayonets. There are no letter-carriers, for the houses are not numbered, but there are letter-boxes at the general post-office. There are six newspapers, including the official organ of the Government. A large proportion of the printing is on hand-bills, which are posted on the street corners, by individuals on their private affairs as well as by the Government on affairs of state. In the revolution of 1885, fifty different hand-bills were posted daily on the walls of the city. Most of the newspaper reading is done at the street corners by means of these bulletins, and for the announcement of a death the hand-bills are bordered with black. The people dress in the latest Paris fashion, but the ladies have not yet discarded the graceful mantilla. There are convent-schools of a high order. The University of Bogotá, an institution of wide influence, has an astronomical observatory, which has no equal except in the National Observatory in Washington. The Foundling Hospital, capable of accommodating several hundred infants, is no longer used for the purpose. The military are not of the average height of United States troops, but are well drilled, having been trained by a United States army officer who spent three years in the city for that purpose. The officers' uniform is a dark-blue dress-coat lined with scarlet, scarlet epaulets, and scarlet stripes on the dark-blue trousers. The arms used are those known as the Springfield, English, and Austrian patterns.

COLORADO. State Government.—The following were the State officers during the year: Governor, Benjamin H. Eaton, Republican; Lieutenant-Governor, Peter W. Breene; Secretary of State, Melvin Edwards; Treasurer, George R. Swallow; Auditor, Hiram A. Spruance; Attorney-General, Theodore H. Thomas; Superintendent of Public Instruction, Leonidas S. Cornell; State Engineer, E. S. Nettleton; Railroad Commissioner, William B. Felker; Forest Commissioner, E. T. Ensign; Supreme Court: Chief-Justice, William E. Beck; Associates, Joseph C. Helm and Samuel H. Elbert.

Population.—The total population of the State, as shown by the census of 1880, was 199,327. The population on June 1, 1885, was 243,910, an increase of 49,583, or 25.56 per cent., in five years. The present population is divided among the races as follows, Indians upon reservations not included: White, 239,585; negroes, 3,262; Chinese, 861; Indians, 200. It

is further divided as to sexes as follows: Males, 144,781; females, 99,129.

Political.—The Republican State Convention met in Denver on the 28th of September, and nominated the following ticket: For Governor, William H. Meyer; Lieutenant-Governor, N. H. Meldrum; Treasurer, P. W. Breene; Secretary of State, — Rice; Auditor, D. P. Kingsley; Attorney-General, Alvin Marsh; Superintendent of Public Instruction, L. S. Cornell; Congressman, George D. Symes.

The Democratic State Convention met at the same place on the 5th of October, and nominated the following ticket: For Governor, Alva Adams; Lieutenant-Governor, L. H. Gillespie; Secretary of State, Jerry Mahoney; Treasurer, James F. Benedict; Auditor, Casimero Barelli; Attorney-General, Col. Stirman; Congressman, Myron W. Reed. The following are among the resolutions adopted:

Resolved, That we favor the coinage of silver on the same terms as gold, and the adoption in the first instance of unlimited silver coinage by our own Government, to be followed by active measures to bring about its consideration as an international subject.

We denounce the corrupt and wasteful extravagance of successive Legislatures which Democratic members have vainly opposed. The State Legislature has been Republican since 1876. Each successive session has squandered the money of the people with reckless and increasing wastefulness, until the annual expenses of the State are wholly beyond reasonable bounds. To provide places for an army of parasitical Party workers, official positions have been multiplied beyond the necessities of government and far beyond the ability of the State to pay for. As a consequence, the State tax levy of nearly five mills is in excess of the constitutional limitation and void, and the credit of the State is threatened. We pledge the Democratic party, its nominees, and its representatives in the General Assembly, to a reduction of expenditures and of taxation to honest and legal limits.

That the interests of the people of this State, collectively and individually, demand immediate legislation with the power to summarily enforce its observance, whereby railroad corporations shall be limited in their power to fix rates for passenger and freight traffic, such rates to be arranged with due regard as well to the actual amount of capital invested in said companies, as to the amount and cost of business transacted; to prevent and punish fictitious capitalization of said companies, discriminations or rebates in rates, either as between individuals or localities; to compel the granting of common privileges and rights to all classes of people, as well as an interchange of business with connecting or competing terminal lines; to enforce a strict compliance with all constitutional and other legal requirements, having for their object the public weal and the restraint of power, and to prevent any further identification of the business of common carriers with that of dealers in the commodities to be carried. We demand legislation upon this important subject that may be enforced either by means of a commission properly appointed, or directly by summary proceedings in the courts of justice.

That the definition of conspiracy is not confined to strikes and impulsive efforts of the poor by violence to better their condition, but extends as well to the secret conclaves of capital to pool and combine their franchises in aid of unjust exactions from shippers and passengers.

That the interests of the farming classes and of our cities demand that the next General Assembly shall by proper legislation regulate and fix the charges to be

made by ditch, irrigation, and other water companies, for water, so that such charges shall not exceed a fair per centum upon the amount of capital actually invested in such enterprises.

That we demand speedy measures to abolish, by fair purchase, the Indian reservations remaining in Colorado, especially the strip of land in La Plata County, as useless to the Indian tribes and a constant threat and menace to the peace and security of the southern border.

That the only practical solution of the convict-labor question is to keep the convicts employed in some labor not in competition with any recognized industry of the people, and that this can be done by their organized, systematic, and permanent employment in the construction and improvement of public roads.

There was also a Prohibition ticket in the field. The Democratic candidate for Governor was elected by a small plurality, while the Republican candidates for the other places were successful.

Wool-Growers.—The third annual convention of the Colorado State Wool-Growers' Association was held at Greeley, on Oct. 5. It was organized in Denver, on March 12, 1884. Its sessions have not been very well attended. The president gave the following account of the business in the State:

Looking back to the year 1875, the assessors returned from the various counties of the State 424,977 sheep. The numbers increased rapidly in the following years, the returns for 1879 being 779,935, and in 1880, 782,640. The severe drought of 1880 caused losses and exportation, so that the returns for 1881 were reduced to 634,342, increasing to 706,048 in 1882 and 834,785 in 1883. The repeal of ad valorem duty on wool checked the increase, and in 1884 there was a falling off in numbers to 822,273. The flockmasters, notwithstanding the discouragements, renewed their grip, and returned, for 1885, 863,926 sheep. The returns for 1886 are not yet complete. I have been unable to secure accurate information regarding the wool-clip, but 7,000,000 pounds is doubtless a fair estimate for this year's clip. It is impracticable to secure accurate figures regarding the number of sheep sold as surplus from the flocks of the State. The data given show that the Colorado State Wool-Growers' Association represents an invested capital of more than \$5,000,000, and a yearly revenue of more than \$2,500,000.

The following resolutions were adopted as the sense of the meeting:

Resolved, That the great interest of wool-growing in the State, second only in capital invested and annual revenue to mining and cattle-breeding, demands the continuance of the Association to protect and promote our interests, and that every wool-grower in the State ought to join the Association and contribute his share to the common defense.

That we reiterate our demand for the restoration of the tariff of 1887 on wool and woolen goods, as being the best possible adjustment of the interests of manufacturers and producers of wool, evidenced by the unparalleled growth and prosperity of both interests from the date of the adoption of said tariff to the date of its repeal in 1883, and the great disaster to both interests following that repeal.

That the repeal of the bounty on wolf-scalps has resulted in a vast increase in numbers of these pests, and great damage to our flocks; that the rapid increase of these animals not only menaces our sheep, but calves and colts as well, and that the bounty heretofore paid by the State is insignificant compared with the losses we now sustain; we therefore, ask the Legislature, at its next session, to enact a law author-

izing the payment of \$2.50 for each wolf or coyote scalp.

That we respectfully ask of the Legislature at its next session a liberal appropriation for the expenses of the State Veterinary Sanitary Board, to the end that all domestic animals afflicted with contagious diseases may be quarantined and such disease be effectually stamped out.

That in justice to the wool-growing interest, we request that a member of the State Wool-Growers' Association be appointed a member of the State Veterinary Sanitary Board.

That the State Veterinary Sanitary Board be and is hereby requested to adopt a regulation requiring all persons driving sheep into the State to secure from the State Veterinary Surgeon, or a member of the State Veterinary Sanitary Board, a certificate that the flock is free from contagious disease before they cross the boundary of the State.

That it is gross injustice to be compelled to pay \$1.50 and \$1.25 per hundred freight to the Missouri river on our wool, since it is profitably transported from the Missouri river to the seaboard, more than twice the distance, for less than half the freight charge to the river.

The Legislature consists of 18 Republicans and 8 Democrats in the Senate and 25 Republicans and 24 Democrats in the House.

The vote for Congressmen was as follows: George G. Symes (Republican), 27,782; Myron W. Reed (Democrat), 26,929; Joseph Murray, 3,597. Amendments to sections 1, 3, 12, and 14 of Article XI of the Constitution were ratified, and those to sections 5, 24, and 26 rejected. The amendments relate to details of the judicial system. The vote for Governor is not officially canvassed until the meeting of the Legislature.

Cattle.—The number of cattle shipped out of the State in 1885 was 75,579. These required to move them 3,358 cars, and were divided as to class as follows:

Steers	72,857
Cows	21
Bulls	261
Mixed cattle	2,840
Total	75,579

The number of cattle shipped and driven into Colorado during the same period was 132,614. This does not include any cattle which may have passed through the State for parts beyond. By these figures it will be seen that there were brought into Colorado 57,035 more cattle than were sent out during the year. The actual number of cattle slaughtered for home consumption in the State can not be ascertained, but can be closely estimated at 54,560.

The shipments out of the State the previous year did not exceed 60,000.

Finanees.—Colorado has no bonded debt. The assessed valuation for 1885 (Garfield County's returns being unofficial) is \$115,415,929.

The total amount of tax levied for 1886 is \$665,269.48, as against \$640,874.72 for 1885.

The balance in the treasury at the close of the last fiscal term, Nov. 30, 1884, in cash and securities, was \$513,135.61; there was received from all sources during the two years ending Nov. 30, 1886, the sum of \$1,837,395.24, mak-

ing a total of \$2,350,530.85. The total disbursements from the treasury for this period were \$1,515,951.80, leaving a balance at the close of business Nov. 30, 1886, in cash and securities of \$834,579.05. The State debt was:

Outstanding warrants.....	\$594,699 63
Certificates of indebtedness.....	18,483 91
Loco-woed certificates.....	53,690 52
Total.....	\$666,574 11
Less cash in treasury applicable.....	22,236 43

Total indebtedness..... \$644,337 68

The total revenue outstanding to meet this is \$667,822.97. From this the Auditor deducts 20 per cent. as unavailable, leaving \$534,258.38. This leaves the debt payable from the general fund, \$110,879.30 in excess of the revenue.

Railroad Valuation.—The State Board of Equalization placed the following valuations upon the railroads in Colorado in 1885:

BROAD GAUGE.

Burlington and Colorado.....	\$1,883,577 93
Pueblo and Arkansas Valley.....	2,452,192 05
Denver and New Orleans.....	843,274 86
Union Pacific, Union division.....	72,927 97
Union Pacific, Kansas division.....	1,411,204 39
Denver Pacific.....	658,286 02
Golden, Boulder and Caribou.....	42,388 84
Denver and Boulder Valley.....	197,186 75
Denver, Western and Pacific.....	152,615 66
Denver, Western and Pacific (grade only).....	13,665 00
Greeley Short Line and Pacific.....	293,992 24
Greeley Short Line and Pacific (grade only).....	8,500 00
Julesburg division, Union Pacific.....	1,179,929 63
Colorado Central.....	675,350 93

NARROW GAUGE.

Greeley Short Line and Pacific.....	\$75,523 32
Georgetown, Breckenridge and Leadville.....	8,175 00
Georgetown, Breckenridge and Leadville (grade only).....	3,825 00
Denver, South Park and Pacific.....	2,150,342 28
Colorado Central.....	57,407 66
Denver Circle.....	51,048 20
Denver, Utah and Pacific.....	212,967 27
Denver, Utah and Pacific (grade only).....	8,403 50
Denver and Rio Grande.....	7,505,642 21

Total..... \$20,033,164 96

Land-Office.—The United States Land-Office makes the following report of the business transacted during 1885: Number of pre-emption filings, 2,398; number of acres in cash entries, 61,009; number of acres in final homesteads, 21,039; number of acres in original homesteads, 105,580; number of acres in timber-culture entries, 362,258.

Denver Manufactures.—Recent statistics reveal the fact that the city has double the number of establishments it had five years ago, with three times the number of employés, and eight times the capital invested.

Lead.—The production of lead in Colorado has been as follows:

	Tons.	Tons.	
1873.....	50	1879.....	23,674
1874.....	312	1880.....	38,674
1875.....	818	1881.....	40,547
1876.....	667	1882.....	55,000
1877.....	897	1883.....	40,547
1878.....	6,369	1884.....	63,165

To this we may add the product for 1885, which will probably not exceed 57,000 tons, of 2,000 pounds, the Leadville district alone show-

ing a falling off of about 20,000 tons. A very slight gain over 1885 was expected in 1886.

Quarrying.—The work done by the stone department of the Union Pacific Railroad and other quarries in Colorado, is but little understood. Along the foot-hills of the Continental divide, from the Wyoming line to the Raton range, is a series of hog-back elevations. In these upheavals are found inexhaustible quantities of stone and marble, suitable for the manufacture of lime and for building from the rough rubble-stone that sustains the superstructure of buildings, piers, and bridges, to the substantial granite, the various colored sandstone, and the finer varieties of marble equal to that of Tennessee and Vermont.

In almost all cases the material lies above the surface, and the process of quarrying consists in uncovering and removing earth and boulders and revealing the dip of the formation. The Union Pacific Company decided to quarry on its own account and ship directly to consumers, and have established a special department, entitled the "Stone Department, Union Pacific Railroad." The principal quarries are at Stout, where 250 men are regularly employed, the pay-roll being from \$10,000 to \$12,000 per month. There are in addition from 50 to 100 men employed by others, who dispose of their products to the company. The company owns a large area of quarry-ground at Lyons, principally producing red sandstone. Here are employed about 75 men. Ten miles northwest of Loveland, and a short distance south of Stout, the Buckhorn quarries have been opened.

The marble-quarries of Gov. Routt at Marble Glen, ten miles northwest of Fort Collins, are practically inexhaustible, and the deposits of the most beautiful material for building and all kinds of marble-work lie exposed.

There have been transported eastward, during the past three years, about 12,000 car-loads of stone, the value being about \$500,000.

COMMERCE AND NAVIGATION OF THE UNITED STATES.—The total value of the foreign trade during the year ending June 30, 1886, was \$1,314,960,966, being \$4,756,118 less than in 1884-'85. The decline was much less than in the two previous years, the volume of trade having fallen off \$88,494,218 in 1884-'85 from that of the preceding year, when it was \$138,809,014 less than in 1882-'83. The exports of merchandise in 1885-'86 amounted to \$679,524,830, showing a decrease of \$62,664,925. The value of the imports was \$635,436,136, being greater by \$57,908,807 than in 1884-'85. The value of the exports of domestic produce was \$665,964,529 in 1885-'86, as compared with \$726,682,946 in 1884-'85; that of the exports of foreign merchandise, \$13,560,301, as compared with \$15,506,809.

The exports of gold in 1885-'86 were \$42,952,191, as compared with \$8,477,892 in 1884-'85, and \$41,081,957 in 1883-'84. The imports of gold were \$20,743,349 in 1885-'86, \$26,691,696 in 1884-'85, and \$22,831,317 in

1883-'84. The exports of silver in 1885-'86 were \$29,511,219, as compared with \$33,753,-633 in 1885, and \$26,051,426 in 1884; the imports of silver, \$17,850,307 in 1886, as compared with \$16,550,627 in 1885, and \$14,594,-945 in 1884. The total exports of specie in 1886 were \$72,463,410, and the imports \$38,-593,656, showing an excess of exports of \$33,-869,754, as compared with an excess of imports in 1885 of \$1,010,798, and an excess of exports of \$29,707,121 in 1884.

Imports.—The value of free goods imported in 1885-'86 was \$212,159,296, and that of dutiable goods \$423,276,240. The value of manufactured articles imported was \$379,987,-472, and of crude and partly manufactured articles \$255,448,664. The articles that showed the largest increase were sugar, wool, hides and skins, woollen manufactures, and raw silk. There was a marked decrease in the imports of coffee, fish, flax, hemp and jute, and seeds. The imports of sugar and molasses constituted 13·60 per cent. of the total value of imports in 1885-'86; wool and manufactures thereof, 9·15 per cent.; silk and silk manufactures, 7·28 per cent.; coffee, 6·72 per cent.; iron and steel and manufactures thereof, 6·11 per cent.; chemicals, drugs, dyes, and medicines, 5·96 per cent.; flax, hemp, jute, and manufactures of them, 4·87 per cent.; cotton and cotton manufactures, 4·78 per cent.; hides and skins, 4·20 per cent.; fruits, 2·72 per cent.; tea, 2·52 per cent.; wood and manufactures thereof, 1·92 per cent.; India-rubber, 1·91 per cent.; leather, 1·87 per cent.; tobacco, 1·76 per cent.; liquors and wines, 1·58 per cent.; all other articles, 23·05 per cent. The total value of imports was greatest in 1882, when it attained the sum of \$724,639,574, after which the amount declined steadily to \$577,527,329 in 1885, and then rose to \$635,436,136 in 1886. The values of the leading articles imported in 1886, as compared with their importation in 1882, are shown in the following table:

ARTICLES OF IMPORT.	1882.	1886.	
Sugar.....	\$90,451,388	\$80,797,077	
Molasses.....	10,040,511	5,595,670	
Wool.....	11,096,050	16,746,081	
Woollen manufactures.....	87,362,592	41,421,819

Total		\$724,639,574
		\$685,486,136

The ratio of manufactures to crude and partly manufactured articles has steadily declined. In 1860 manufactured articles formed 73·88 per cent. of the total imports; in 1870, 70·74 per cent.; in 1880, 62·44 per cent.; in 1882, 63·51 per cent.; in 1883, 64·27 per cent.; in 1884, 63·98 per cent.; in 1885, 59·90 per cent.; in 1886, 59·80 per cent.

The imports from all the industrial countries of Europe showed an increase in 1886 over those of the preceding year. The increase in value of the imports from Great Britain was \$17,552,274; from Germany, \$5,913,244; from France, \$6,482,078; from the Netherlands, \$2,871,097; from Italy, \$2,377,728; from all Europe, \$38,805,137. The imports from the Spanish West Indies were \$7,294,968 greater. The imports from Brazil were \$3,356,128 less.

in value, which was counterbalanced by an increase of nearly equal amount in the imports from other South American countries.

The following table shows the values of the merchandise imports from the principal foreign countries in 1882 and 1886, and the percentage of the total imports coming from each country in 1886 :

COUNTRIES.	1882.	1886.	Per cent.
Great Britain and Ireland	\$195,588,692	\$154,254,054	24·28
West Indies	91,803,522	71,053,146	11·18
Germany	56,368,549	69,154,997	10·88
France	88,597,606	63,417,430	9·98
Brazil	48,801,578	41,997,532	6·59
British North America	51,118,475	37,496,838	5·91
China	20,214,341	18,972,963	2·99
British East Indies	18,057,918	17,247,825	2·71
Italy	12,114,221	16,570,636	2·65
Japan	14,439,495	14,588,573	2·84
Switzerland	—	14,358,981	2·26
Mexico	5,461,899	10,687,972	1·68
Hawaiian Islands	7,646,294	9,805,707	1·54
Other Spanish possessions	9,970,155	9,566,912	1·51
Belgium	20,999,668	9,173,518	1·44
Netherlands	8,165,728	8,528,846	1·34
Austria	2,444,512	6,608,055	1·05
Spain	5,099,506	5,980,202	0·93
Central America	4,735,398	5,915,413	0·93
Venezuela	6,746,300	5,791,621	0·91
Argentine Republic	5,284,914	5,022,346	0·82
Uruguay	6,837,736	4,925,843	0·78
Australasia	8,689,424	8,859,360	0·61
Dutch East Indies	4,122,850	8,175,980	0·50

The imports from other countries amounted to the value of \$26,815,400 in 1886, forming 4·22 per cent. of the total imports. The imports from Great Britain decreased steadily from \$195,588,692 in 1882 to \$136,701,780 in 1885, and rose again in 1886 with the general improvement in the import trade. The imports from Germany have steadily increased from \$82,509,365 in 1877 to more than double that sum. They embrace a wide range of manufactured products, but the principal increase has been in cotton and woolen manufactures, fancy articles, glassware, silk goods, and manufactures of iron and steel. The exports to Germany have increased, but at a slow rate, and instead of a large excess of exports in the trade with Germany, which excess amounted to \$25,598,068 in 1877, there was a balance of trade of \$7,193,804 in favor of Germany in 1886. The trade with Italy shows the same rapid growth on the side of imports, and a shifting of the balance of trade, notwithstanding an increase of exports. The imports of French products are always large, and in prosperous years expand suddenly, but the export trade to France has fallen away to less than half of what it was six or eight years ago. In 1886 the imports landed on the wharves of New York constituted 65·99 per cent. of the total value of the imports of merchandise; those received at Boston 9·20 per cent., those landed at San Francisco 5·85 per cent., and at Philadelphia 5·76 per cent., while Baltimore imported 1·84 per cent. of the total value, Chicago 1·60 per cent., New Orleans 1·28 per cent., and all other ports 8·48 per cent.

Exports.—The decline in the value of domes-

tic exports, amounting to \$60,718,417, was in the exports of breadstuffs, provisions, refined sugar, cattle, and copper. The falling off of exports to Europe was about \$57,000,000. In the exports to Great Britain it was nearly \$50,000,000, and to France \$4,556,000. There was a decrease in the exports to South America of \$1,689,000. The exports to France, which amounted to \$98,889,209 in 1880, fell away to \$40,096,000 in 1886, owing chiefly to the exclusion of American pork, and also to a decrease in the lard and wheat exports to that country. The exports of cotton to Germany increased from 77,605,283 pounds, valued at \$9,061,899, in 1877, to 284,717,581 pounds, valued at \$28,494,555, in 1886; but the exports of petroleum to Germany fell off, owing to the competition of the Russian oil, from the value of \$17,262,964 in 1877 to \$7,752,121 in 1886.

The exports of agricultural products in 1886 amounted to \$484,954,595, constituting 72·82 per cent. of the total value of the domestic exports; the exports of manufactured products were \$106,419,692, 15·98 per cent. of the total; the exports of mining products, inclusive of mineral oils, were \$57,994,553, or 8·71 per cent. of the exports; the exports of forest products were \$6,743,727, equal to 1·01 per cent.; the exports of the products of the fisheries were \$5,138,806 in value, their percentage being 0·77; and all other exports amounted to \$4,713,156, or 0·71 per cent. of the whole.

The following table exhibits the value of the principal domestic exports in 1885-'86, as compared with the values in 1880-'81, the year of the largest exports:

ARTICLES OF EXPORT.	1881.	1886.
Raw cotton	\$241,693,746	\$205,085,642
Cotton manufactures	14,105,348	18,959,994
Breadstuffs	269,556,720	125,546,558
Provisions	156,809,840	90,625,216
Mineral oils	40,315,609	50,199,844
Vegetable oils	1,606,472	2,475,622

All other articles.....	6,526,676	4,298,822
Total.....	\$883,925,947	\$663,964,29

The quantities of the leading articles exported show a much smaller decrease since 1881

than the values. The quantity of raw cotton exported in 1886 was 2,058,037,444 pounds, being 6·1 per cent less than in 1881, while a comparison of the values shows a decline of 17·3 per cent. The export of Indian corn was 63,655,433 bushels, 30·7 per cent. less in quantity, and 37·4 per cent. in value; that of corn-meal, 293,546 barrels, 32·5 per cent. less in quantity, and 38·3 per cent. in value; that of rye, 196,725 bushels, 89·8 per cent. less in quantity, and 92·9 per cent. in value; that of wheat, 57,759,209 bushels, 61·7 per cent. less in quantity, and 70·2 per cent. in value; that of wheat-flour, 8,179,241 barrels, 2·9 per cent. more in quantity, but 14·6 per cent. less in value. The export of live cattle was 119,065 head, 35·8 per cent. fewer than in 1881, and 23·4 per cent. less in value. The export of fresh beef, 99,423,362 pounds, showed a decline of 6·2 per cent. in quantity, and 5·7 per cent. in value; salted and cured beef, 59,728,325 pounds, an increase in quantity of 2·5 per cent., and in value of 36·3 per cent.

The following table exhibits the average export prices of corn and wheat per bushel, flour per barrel, mineral oil per gallon, and other leading articles per pound in 1886 and the five preceding years, and in 1876, 1866, and 1856:

Total.....	\$605,010,177	\$660,527,980	\$655,152,372

In the export of spirits there was a falling off in 1886 of \$2,819,702; in hides and skins, of

\$948,133; and in clover-seed, \$1,260,401, while other seed showed an increase of \$1,043,717. Of the decrease in the exports of meat products, \$7,757,702 was in pork products, \$3,923,853 in beef products, and \$1,592,812 in other meat products.

The following table exhibits the values of the exports of domestic merchandise, divided into products of agriculture, products of manufacture, and products of mining, forestry, fisheries, etc., for the last ten years, and for the years 1860 and 1870:

YEAR.	Products of agriculture.	Products of manufacture.	Products of forestry, etc.	Total.
1860.	\$256,560,972	\$45,658,873	\$14,022,588	\$316,242,428
1870.	861,188,488	47,921,154	46,098,704	455,208,841
1877.	459,734,148	88,007,773	58,238,938	632,980,584
1878.	536,192,578	91,416,576	68,140,481	695,749,980
1879.	546,476,708	89,117,215	63,944,824	699,588,742
1880.	685,961,091	79,510,447	58,474,815	828,946,358
1881.	780,394,948	89,219,350	64,211,624	883,925,947
1882.	552,219,819	108,182,481	77,887,432	738,229,732
1883.	619,269,449	111,890,001	73,064,182	904,228,632
1884.	536,815,518	113,830,242	77,319,298	724,964,852
1885.	530,172,666	117,259,310	79,250,170	726,682,946
1886.	484,954,595	106,419,692	74,590,242	665,964,529

The values of the principal articles of agricultural production, constituting in 1886 about 95 per cent. of the total value of the exports of all products of agriculture, are given for the same years in the following table:

YEARS.	Cotton, raw.	Breadstuffs.	Leaf-tobacco.	Provisions, comprising meats and dairy products.	Cattle, sheep, and hogs.	Total.
1860.....	\$191,806,555	\$24,422,810	\$15,906,547	\$16,934,368	\$1,463,643	\$250,533,418
1870.....	227,027,624	72,250,988	21,100,420	30,992,305	724,933	832,096,215
1877.....	171,118,508	117,806,476	28,525,521	118,579,676	2,526,740	438,856,921
1878.....	180,091,484	181,777,841	24,803,165	124,845,187	4,497,576	515,955,203
1879.....	162,804,250	210,355,528	25,157,364	119,857,692	10,162,400	527,887,284
1880.....	211,595,905	288,096,888	16,379,107	132,488,201	14,657,931	663,297,979
1881.....	247,695,746	270,892,519	18,737,043	156,809,840	15,639,178	709,514,321
1882.....	199,812,644	182,670,528	19,067,721	122,020,530	8,913,656	532,485,079
1883.....	247,388,721	205,040,850	19,498,066	109,217,119	9,765,803	599,798,559
1884.....	197,015,204	162,544,715	17,763,760	114,358,788	19,353,121	511,012,588
1885.....	201,962,458	160,370,821	22,025,786	107,382,456	18,995,441	505,659,962
1886.....	205,085,642	125,846,558	27,158,457	90,625,216	11,963,095	460,678,968

The values of domestic merchandise exported to the principal foreign countries in 1886, compared with the exports to the same countries in 1881, with the percentage of each country in the total exports for 1886, are shown in the following table:

COUNTRIES.	1881.	1886.	Per cent. for 1886.
Great Britain and Ireland	\$477,450,619	\$844,927,973	51·79
Germany.....	68,858,571	60,923,557	9·15
France.....	89,844,100	40,006,096	6·01
British North American provinces.....	85,793,031	81,058,124	4·80
West Indies.....	29,148,138	25,876,583	3·81
Belgium.....	85,683,574	22,613,399	3·40
Netherlands.....	25,785,004	14,536,664	2·18
Italy.....	8,987,417	18,045,546	1·96
Spain.....	12,593,288	13,047,762	1·96
British possessions in Australasia.....	6,636,180	10,981,915	1·65
Russia in Europe.....	15,818,823	9,705,395	1·47
China.....	5,447,281	7,518,277	1·18
Mexico.....	9,198,077	6,556,077	1·03
Brazil.....	9,183,637	6,480,188	.97
United States of Columbia.....	5,179,866	5,294,798	.79
British East Indies.....	858,069	4,850,141	.65
Argentine Republic.....	2,258,183	4,831,170	.65
Portugal.....	4,291,088	4,306,205	.65
Hong-Kong.....	2,914,668	4,044,384	.61

The exports to other countries besides those enumerated amounted to \$35,562,500, or 5·34 per cent. of the total exports. The exports to European countries amounted to \$533,614,395, constituting 80·18 per cent. of the total value of the exports; to Asia and Oceania, \$36,178,091, being 5·43 per cent. of the whole; to British North America, \$31,953,124, or 4·80 per cent. of the exports; to the West Indies, \$25,376,353, or 3·81 per cent.; to South America, \$25,277,323, or 3·79 per cent.; to Mexico, Central America, and British Honduras, \$9,662,776, or 1·45 per cent.; to Africa, \$2,777,382, or 0·42 per cent.; to all other countries, \$1,125,085, or 0·17 per cent. The exports to Italy, Spain, the Spanish West Indies, and China, showed an increase of over \$1,000,000 each, as compared with 1885, and those to Australasia and the Hawaiian Islands of over \$400,000 each. Those to Belgium and the Netherlands were less by more than \$2,000,000. The export trade with China averaged \$2,264,000 in 1877-'80. The exports to South American countries increased from \$22,169,891

in 1877 to \$31,226,934 in 1884, and have since declined to \$26,131,991. The exports to Australasia, India, Japan, and other countries in Asia, and Oceania show a progressive increase.

The exports from the port of New York constituted 46·26 per cent. of the total value of exports during the year ending June 30, 1886; 12·15 per cent. of the exports were shipped from New Orleans; from Boston, 7·96 per cent.; from Baltimore, 5·27 per cent.; from Philadelphia, 4·97 per cent.; from San Francisco, 4·45 per cent.; from Savannah, 2·99 per cent.; from Charleston, 2·60 per cent.; from Galveston, 2·50 per cent.; from Norfolk, 1·71 per cent.; from Huron, 1·22 per cent.; from all other ports, 7·92 per cent.

The Export Trade in Wheat.—The average production of wheat in Europe for the eight years preceding 1881 was 1,144,000,000 bushels, and the average consumption in both food and seed 1,312,000,000 bushels, requiring a supply from other countries of 168,000,000 bushels per annum. The consumption of wheat in European countries ranges from 9 bushels per capita in France to 1 bushel in Norway, but averages about $3\frac{1}{2}$ bushels for food and $\frac{1}{2}$ bushel for seed. The yield in Western Europe during a portion of that period was abnormally low, stimulating the exports from the United States, and causing an increase of millions of acres in the wheat area. The production in Russia, India, South Australia, and other countries, was increased from the same cause. In the succeeding five years the European production averaged 50,000,000 bushels more than the yield for the period mentioned, being 1,159,826,380 bushels in 1881, 1,287,352,264 bushels in 1882, 1,152,925,514 bushels in 1883, 1,270,383,227 bushels in 1884, and 1,217,809,309 bushels in 1885. During the ten years preceding 1881, when deficient harvests in Europe caused a great increase in American exports, the production of the United States was 366,000,000 bushels. The average production for the last five years has been 436,000,000 bushels. The increase of 120,000,000 bushels in the production of Europe and the United States was no greater than was required for the increment in the population but in India, Al-

geria, and other countries, the production was stimulated in like manner, and from these countries about 42,000,000 bushels per annum have been forced upon the European market. For this reason the American exports, which averaged 174,000,000 bushels in 1878-'80, declined to 116,000,000 bushels per annum for the period 1881-'85. The average export price of a bushel of wheat declined from \$1.11 to 87-2 cents in 1886. The lowest point was reached in 1885, when the average price was 86-2 cents. The world's product of wheat in 1885-'86 was estimated by the Department of Agriculture at Washington at 2,110,000,000 bushels, of which 1,218,000,000 bushels were produced in Europe, 409,000,000 in North America, 25,000,000 in South America, 287,000,000 in India, 37,000,000 in Australasia, and 134,000,000 in Africa and Western Asia. The average annual product of the world between 1870 and 1880 was about 2,000,000,000 bushels. The exports of the countries producing a surplus in 1880 were 208,987,072 bushels, 69-13 per cent. of which represent the exports of the United States. In 1884 the same countries exported 202,352,523 bushels, only 40-34 per cent. of which came from the United States. In 1883 the share of the United States in the exports of the wheat-producing countries was still less, being 34-86 per cent. In 1882 it was 49-78 per cent., and in

1881 55-70 per cent. The exports from Russia in Europe were 36,565,653 bushels in 1880, 48,972,597 in 1881, 76,373,532 in 1882, 83,777,096 in 1883, and 67,719,720 in 1884. The exports from British India were 13,896,168 bushels in 1880, 37,078,571 in 1881, 26,402,893 in 1882, 39,118,791 in 1883, 29,550,741 in 1884, and 39,312,969 in 1885. The exports from South Australia, Victoria, and New Zealand, were 13,999,415 bushels in 1880, 9,729,596 in 1881, 8,506,904 in 1882, 7,481,949 in 1883, and 19,466,921 in 1884. The exports from the Argentine Republic, which were only 42,829 bushels in 1880, 5,772 in 1881, and 62,659 in 1882, rose to 2,292,352 in 1883, 3,986,663 in 1884, and 2,884,138 in 1885. The exports from the United States were 144,483,007 bushels in 1880, 120,451,888 in 1881, 110,343,185 in 1882, 79,065,180 in 1883, 74,962,078 in 1884, and 46,678,257 in 1885. The total exports from these countries, representing very nearly the European demand, showed but little variation, being 208,987,072 bushels in 1880, 216,238,424 in 1881, 221,689,173 in 1882, 203,683,468 in 1883, and 202,352,523 in 1884.

Exports of Provisions.—The following table exhibits the values of the exports of the various classes of provisions for each year since 1880, and at intervals of five years before that year, showing the growth of this branch of foreign commerce since 1860:

YEARS.	Bacon and hams.	Pork.	Lard.	Total hog-products.	Beef-products.	All other meat-products.	Dairy products.	Total value.
1860.....	\$2,273,768	\$3,122,813	\$4,545,831	\$9,951,912	\$4,272,500	\$2,709,951	\$16,984,368	
1865.....	10,596,608	6,850,508	9,134,858	26,522,274	8,324,685	\$142,688	19,026,199	54,015,841
1870.....	6,128,113	8,253,127	5,933,397	15,300,647	5,743,639	813,757	9,614,262	80,992,305
1875.....	28,612,613	5,671,495	22,900,522	57,184,690	9,890,159	735,112	15,290,164	88,100,655
1880.....	50,957,623	5,930,252	27,920,367	84,885,422	18,012,197	16,637,957	18,988,420	132,488,201
1881.....	61,161,205	8,272,285	35,626,375	104,660,063	19,326,673	10,061,379	22,175,742	156,809,840
1882.....	46,675,774	7,201,276	28,975,902	82,532,946	14,687,235	7,856,814	17,124,085	122,020,530
1883.....	38,155,952	6,192,226	26,615,048	70,966,263	15,383,262	9,811,993	18,605,696	109,217,119
1884.....	39,684,845	4,762,715	25,305,958	69,758,519	28,224,506	5,758,277	15,617,492	114,858,788
1885.....	37,083,948	5,203,948	22,595,219	64,888,110	22,421,788	5,710,219	14,899,389	107,382,456
1886.....	31,640,211	5,123,411	20,361,786	57,125,405	18,505,985	4,117,407	10,876,466	90,625,216

The exports of live cattle declined from 185-707 head in 1881 to 119,065 in 1886, a decrease in quantity of 35-8 per cent., while the decrease in value was 23-4 per cent. Beef-products show a decrease of 17-7 per cent. in quantity and 21-5 per cent. in value. The decline in pork-products has been 35-1 per cent. in quantity and 45-4 per cent. in value. The exports of butter and cheese have likewise declined. The exports of bacon and hams to Germany, which were never so large as has been commonly believed, reached their highest point in 1873, when they amounted to 65,708,546 pounds. For the ten years from 1871 to 1880 their average annual value was only \$2,291,967. The imports of American lard have not been prohibited in Germany, and are still large. They were greatest in 1879, when the returns of lard exported to Germany reached a total amount of nearly 90,000,000 pounds. In 1886 the lard exports to Germany were over 62,000,000 pounds, of the value of \$4,126,311. The export trade in bacon, hams, and pork

was more seriously affected by the restrictions placed by the French Government on the importation of American pork-products than by the German regulations.

Exports of Live Animals.—The exports of cattle were only \$159,000 in value in 1865, \$439,987 in 1870, and \$1,593,080 in 1877. They more than doubled in each of the two succeeding years, and rose to \$14,304,108 in 1881, fell off to \$7,800,227 the year following, showed a slight increase in 1883, and then doubled in 1884, reaching their highest point, but then declined from \$17,855,495 in that year to \$12,906,690 in 1885 and \$10,958,954 in 1886. The value of the exports of sheep declined from \$1,154,856 in 1883, when they were greatest, to \$329,844 in 1886. The exports of live hogs suddenly rose to \$1,625,837 in value in 1874, and since that year have averaged \$544,000. In 1886 they were \$674,297.

Imports entered for Consumption.—The total value of merchandise withdrawn from warehouse and that entered for immediate consump-

tion during the year ending June 30, 1886, was \$625,778,055, against \$579,580,054 in 1884-'85, and \$667,575,889 in 1883-'84. The value of dutiable merchandise entered for consumption was \$413,778,055 in 1885-'86, \$386,667,820 in 1884-'85, and \$456,295,124 in 1883-'84. The amounts of duty collected in 1886 was \$188,533,171, the average ad valorem rate being 45·80 per cent.; in 1885, \$177,414,454, or at the rate of 46·074 per cent.; in 1884, \$189,943,297, representing the average rate of 41·702 per cent. The value of manufactured goods entered for consumption in 1886 was \$377,012,646, and that of unmanufactured goods \$249,296,168. Of the total amount of duties collected 27·337 per cent. was paid on sugar, 2·759 per cent. on raw wool, 14·401 per cent. on woolen manufactures, 7·725 per cent. on iron and steel and manufactures thereof, 3·910 per cent. on manufactures of flax, hemp, jute, and other vegetable fibers, 7·358 per cent. on manufactures of silk, 6·205 per cent. on cotton manufactures, 4·388 per cent. on tobacco, 3·798 per cent. on wines and distilled and malt liquors, 2·295 per cent. on chemicals, drugs, dyes, and medicines, and 19·824 per cent. on all other articles. Articles of food paid 32·42 per cent. of the total duties collected, raw materials 6·83 per cent., partly manufactured goods 10·68 per cent., manufactured articles 29·45 per cent., and articles of luxury 20·53 per cent.

The value of merchandise received for in-transit or transshipment in 1886 was \$37,038,264. Goods of the value of \$10,861,020 were received from British North American provinces, and of that of \$26,177,244 from other countries. The value of transit goods shipped to British North America was \$20,241,079, and of those sent to other countries \$16,797,185.

Carrying-Trade.—The proportion of the foreign commerce of the United States carried in American vessels was 15·07 per cent. in 1885-'86, while 79·38 per cent. was carried under foreign flags, and 5·55 per cent. in land-vehicles. The proportion carried in American steam-vessels was 6·95 per cent.; in foreign

steam-vessels, 65·25 per cent.; in American sailing-vessels, 8·12 per cent.; in foreign sailing-vessels, 14·13 per cent. The value of imports carried in American steam-vessels in 1886 was \$54,011,911; of domestic exports, \$31,751,729; of foreign exports, \$1,127,827; total exports, \$32,879,556; transshipment and in-transit trade, \$9,711,701; total foreign commerce, \$96,603,168. The value of imports carried in American sailing-vessels was \$64,930,906; of domestic exports, \$44,663,036; of foreign exports, \$864,094; total exports, \$45,527,180; in-transit and transshipment trade, \$2,244,740; total foreign commerce, \$112,702,776. The total value of imports carried in American vessels was \$118,942,817; of domestic exports, \$76,414,765; of foreign exports, \$1,991,921; total exports, \$78,406,686; in-transit and transshipment trade, \$11,956,441; total foreign commerce, \$209,305,944. The value of imports carried in foreign steam-vessels was \$428,403,781; of domestic exports, \$442,536,993; of foreign exports, \$7,882,626; total exports, \$450,419,619; in-transit and transshipment trade, \$27,576,087; total foreign commerce, \$906,399,487. The value of imports carried in foreign sailing-vessels was \$63,533,855; of domestic exports, \$130,587,410; of foreign exports, \$966,448; total exports, \$131,553,858; in-transit and transshipment trade, \$1,122,803; total foreign commerce, \$196,210,516. The total value of imports carried in foreign vessels was \$491,937,636; of domestic exports, \$573,124,403; of foreign exports, 8,849,074; total exports, \$581,973,477; in-transit and transshipment trade, \$28,698,890; total foreign commerce, \$1,102,610,003.

The value of imports carried in cars and other land-vehicles was \$24,555,683; of domestic exports, \$16,425,361; of foreign exports, \$2,719,306; total exports, \$19,144,667; in-transit and transshipment trade, \$33,421,197; total foreign commerce, \$77,121,547.

The tonnage entered at ports of the United States in its foreign trade during the year ending June 30, 1886, as compared with 1885, was as follows:

VESSELS.	1886.		1885.		Increase +; Decrease -.

CONGO FREE STATE, a neutral state in Central Africa, constituted under international guarantee by the general act of the Congo Conference, signed at Berlin on Feb. 26, 1885. Conventions recognizing the sovereign rights of the International Association of the Congo, merged at the Berlin Conference into the Free State, were concluded with Germany, on Nov. 8, 1884; with Great Britain, on Dec. 16, 1884; with the Netherlands, on Dec. 27, 1884; with France, on Feb. 5, 1885; and with Portugal, on Feb. 14, 1885. The powers, at the International Conference, undertook to respect the neutrality and inviolability of the Free State, and declared its territories and the rest of the basin of the Congo to be free to the trade of all nations. They reserved the right to decide, until the end of a period of twenty years, whether they would agree to the continuance of freedom of entry. The navigation of the Congo was placed under the direction of an International Commission, representing all the powers signing the act. The sovereign of the Free State is King Leopold of Belgium, who was authorized to accept that quality and title by vote of the Belgian Parliament on April 28 and 30, 1885. Belgium and its Government have no power or responsibility in relation to the Congo State. The central government has its seat at Brussels, and consists of the King of the Belgians and the heads of the three departments of Foreign Affairs and Justice, Finance, and the Interior. The state maintains an armed force of about 2,000 men. The Administrator-General of the local government at Boma is C. Janssen. The Administrator-General of Foreign Affairs and Justice in Brussels is E. van Eetvelde; of Finance, H. van Neuss; of the Interior, Gen. M. Strauch. There are four administrative divisions, under provincial chiefs. These are the Lower Congo, Livingstone Falls and the Pool, the district between the Pool and the equator, and the Upper Congo.

The area of the Free-State territory is estimated at 1,056,200 square miles, with a population of 27,000,000 souls. The state embraces a strip on the north bank of the Congo from the mouth of the river to Manyanga, where French territory begins. Beyond the mouth of the Likona the bank of the Congo belongs to the new state, whose boundary extends thence northward to 4° north latitude, eastward to 30° east longitude, then southward to

Lake Bangweolo, in 12° south latitude, westward from there to 24° east longitude, northward again to 6° south, and then westward to the south bank of the Congo at Nokki. The principal articles of export are palm-oil, rubber, ivory, gum-copal, ground-nuts, orchilla-weed, and cam-wood. The import articles are textile fabrics, fire-arms, powder, spirits, and tobacco. The capital of the Congo State is Leopoldville, on Stanley Pool.

Finances.—The Government, in January, 1886, decided to issue a lottery loan of 100,000,000 francs, in lots of 20 francs, not bearing interest, to be repaid in annual drawings extending over a period of twenty years. The state has a revenue of \$250,000 a year, guaranteed by the King of the Belgians. In February, 1886, the following export duties were established by the Government of the Free State: Earth-nuts, 1·30 franc per 100 kilos; coffee, 1 franc; caoutchouc, 20 francs; gum-copal, 8 francs; palm-oil, 2·50 francs; ivory, 50 francs; palm-nuts, 1·20 franc; sesame, 1·70 franc.

Ratification of the General Act.—The representatives of the powers that signed the general act of the Congo met at Berlin on April 19, to draw up a protocol with reference to the delivery of ratifications. All the signatories ratified the treaty with the exception of the United States, which sent delegates to the Conference on the understanding that their part should be merely deliberative, and should not bind the Government to any action on another continent, as the United States Government is not disposed to share in the disposal of jurisdictional questions in remote foreign territories, or in the obligation to enforce neutrality in the valley of the Congo. The President therefore, abstained from asking the sanction of the Senate to the general act, though Mr. Kasson, who, as minister to Berlin, was a delegate to the Conference, held that the United States, in becoming a party to the instrument, would assume no obligation, except to respect the neutrality of the Congo region.

Railroad Projects.—The founders of the Congo State were aware that a railroad from the head of navigation on the lower Congo to Stanley Pool, above the cataracts, was necessary for the development and success of their political enterprise, and the achievement of the humanitarian and commercial objects for which it was begun. The distance is 235 miles. Beyond there are 7,000 miles of navigable waters already explored, leading to rich and populous districts, yielding many valuable articles of commerce. From Leopoldville, which is 800 miles from the sea, the Congo is navigable for 900 miles up to Stanley Falls.

The Congo State found an English syndicate that was willing to build the railroad; but, after nine months had been spent in negotiations, the authorities in Brussels refused to agree to terms demanded, and the syndicate was dissolved on Sept. 24. The English capitalists demanded that they should have the sole

right to build railroads for fifty years, that privileges in navigation and other matters should be granted to them, and that their property and employés should be under British law and jurisdiction, and not subject to the enactments of the Free State. The Congo Government replied that its international obligations would not allow it to make concessions of that nature. It was decided, after the breakdown of the arrangements with English capitalists, to organize a Belgian syndicate, which should carry out the necessary detailed surveys, and form a permanent company, working in harmony with the Free State Government. A Belgian company was accordingly organized in October for the construction of railroads and other means of inland communication, the institution of navigation services, the construction of ports, docks, and warehouses, and mercantile, industrial, and agricultural operations. The capital was fixed preliminarily at 1,000,000 francs. Among the subscribers were the principal banking, industrial, and trading establishments of Belgium. The senator Montefiore-Levy was elected president. The company undertakes to make a complete survey for the construction of the railroad, and submit to the Congo State detailed plans within eighteen months. The railroad is to be constructed entirely within the territory of the state, that is, along the south bank, starting from some point above Nokki, where Portuguese territory ends. In return for the survey the company receives 150,000 hectares of land, and has the option of constructing the railroad on conditions laid down by the Congo Government. At the end of ninety-nine years the railroad and everything appertaining to it will become the absolute property of the Congo Government. If the company constructs the line, it will receive 1,500 hectares of land for every kilometre built, and will have the right to select the lands, but with only a limited river frontage. The Government, moreover, agrees to grant a subsidy each year of 20 per cent. of the export duties, or such portion of 20 per cent. as will make up the difference between the net receipts of the company and 5 per cent. interest on the capital expended. Of the profits of the enterprise, including the 20 per cent. of the gross produce of the export duties, 5 per cent. will go to the legal reserve, and 6 per cent. to the payment of interest, while of the remainder the Government will receive 40 per cent. and the company 60 per cent.

Ecclesiastical Jurisdiction.—In accordance with the wishes of King Leopold, the Pope, in recognizing the Congo State as under the suzerainty of Belgium, decreed that the Primate of Belgium, the Archbishop of Mechlin, should exercise spiritual jurisdiction over the clergy of the new state. Missionary priests for the Congo are educated in the new African Seminary, connected with the University of Louvain. The claim of the Portuguese prelates on the Congo for ecclesiastical dominion in the

Congo region, though supported by the Portuguese Government, was denied by the Pontiff.

The French Boundary.—A joint commission was to trace the frontier between the Congo State and the French Territory of the Congo in the spring, but owing to a difference of views the commissioners of the Free State did not go to the spot. Both governments in July agreed to submit their differences to the arbitration of the President of the Swiss Republic.

Abandonment of Stanley Falls.—The station at Stanley Falls was evacuated in October in consequence of a quarrel between the Arabs and the agent, an Englishman named Deane, who protected a female slave that had escaped from her master.

CONGREGATIONALISTS. Statistics of Congregationalists in the United States.—The following is a summary of the statistics of the Congregational churches in the United States, as given in the "Year-Book" of the Congregational churches for 1887: Whole number of churches, 4,277, of which 197 were added during the year; number of ministers, 4,090; number of members, 436,341; added on profession during the year, 27,159; number of infant baptisms, 7,348; number of members in Sunday-schools, 521,488; amount of benevolent contributions, so far as they were reported, \$1,677,096; amount of contributions for home expenditures, \$3,909,225.

The whole number of Congregational churches in all lands is estimated to be 11,784, with 10,893 ministers and 1,204,099 members.

American Home Missionary Society.—The sixtieth anniversary of the American Home Missionary Society was held in Saratoga Springs, N. Y., June 1. The Rev. Dr. Julius H. Seelye, of Massachusetts, presided. The receipts of the society for the year had been \$524,545, which, added to the balance in the treasury at the beginning of the year, made its entire available resources \$525,955. The expenditures had been \$498,790, while the society's outstanding pledges still amounted to \$44,951. The whole number of ministers in service was 1,469, and they had supplied fully, or by preaching at stated intervals, 3,005 congregations and missionary districts. Five had preached to congregations of colored people, and 96 in foreign languages. Two thousand and ninety-seven Sunday-schools, comprising 120,000 pupils, were under the special care of the missionaries, and 296 new schools had been organized. The additions to the churches by confession of faith numbered 5,642. One hundred and fifty-two churches had been organized, and 66 churches had become self-supporting.

American Congregational Union.—The thirty-third annual meeting of the American Congregational Union was held in New York city, May 13. The Rev. Samuel Scoville, of Stamford, Conn., presided. The receipts to the treasury for the year had been \$85,183, and were derived from 1,522 churches, a larger number than had ever before contributed to the work of the society. Aid to the amount

of \$50,045 had been voted to 97 churches for building houses of worship, \$15,000 of the sum being in the form of loans to 20 of the churches, and loans to the amount of \$14,250 had been voted to 44 churches to aid in the erection of parsonages. Loans to the amount of \$71,188 had been paid to 133 churches for both of these purposes. The Union had now 74 parsonages which it had aided in constructing, completed, paid for, and occupied. Twenty-four more parsonage enterprises had been voted aid, and three more regular applications for aid were on hand.

American Board.—The seventy-sixth annual meeting of the American Board of Commissioners for Foreign Missions was held at Des Moines, Iowa, October 5. The Rev. Mark Hopkins, D. D., presided. Great interest was attached to the consideration of the case of the Rev. Robert A. Hume, who, after having labored for eleven years as a missionary in India, had been refused by the Prudential Committee permission to return as a missionary because of his adhesion to the "Andover doctrine" of a future state of probation for the dead. The discussion involved a principle of general application regarding the extent to which views deviating from the usually accepted orthodox doctrines would be tolerated in the missionaries of the board. The Prudential Committee presented in its report a general review of its action in the case, not so much in regard to the details as with reference to the principles which govern its course. It regarded itself obligated to obtain satisfactory assurance from candidates as to their position on the leading doctrines of the Scriptures, and as to doubts, if they have any, "respecting any of the doctrines commonly held by the churches sustaining the missions under the care of the board." If a candidate express doubts respecting any of those doctrines, such expression of doubt "leads to further correspondence or conference, in order to ascertain how much or how little is practically meant by the doubt, and also to give opportunity, if possible, to relieve the doubt and establish the inquirer in the truth." When for any reason the committee is not satisfied of the doctrinal soundness of the candidate or of his fitness in other respects for the field of labor for which his appointment is contemplated, it has been its custom to vote that "it is inexpedient to make the appointment at present" or "to defer action." This general method, which was in harmony with a declaration made by the board thirty-seven years previously, that "the board does not assume to decide upon the fitness of an individual to be a minister of the gospel; but it is their duty to decide, and that intelligently, on his original and continued fitness to be sustained by the funds committed to their disposal as a missionary to the heathen" had been "faithfully followed during the past year, this service being regarded by the executive officers and the Prudential Committee as one

of their most serious, sometimes most delicate and difficult, duties." A protest against the action of the committee was sent up by the United Congregational Church of New Haven, Conn., of which Mr. Hume was a member. After a prolonged discussion of the questions involved in the case, resolutions were adopted declaring that "the board recognizes and approves the principle upon which the Prudential Committee has continued to act in regard to appointments for missionary service in strictly conforming to the well-understood and permanent basis of doctrinal faith upon which the missions of the board have been steadily conducted, and to which in the exercise of its sacred trust the committee had no option but to conform."

"The board is constrained to look with great apprehension upon certain tendencies of the doctrine of a probation after death, which has been recently broached and diligently propagated, that seemed divisive and perverse and dangerous to the churches at home and abroad.

"In view of those tendencies they do heartily approve of the action of the Prudential Committee in carefully guarding the board from any committal to the approval of that doctrine, and advise a continuance of that caution in time to come.

"The board recommends to the Prudential Committee to consider, in difficult cases turning upon doctrinal views of candidates for missionary service, the expediency of calling a council of the churches, to be constituted in some manner which may be determined by the good judgment of the committee, to pass upon the theological soundness of the candidate, and the committee is instructed to report on this matter at the next annual meeting."

The receipts of the board from all sources had been \$500,683, of which \$235,985 had come from churches, individuals, and Sunday-schools, \$148,262 from women's boards, \$107,191 from legacies, and \$9,244 from the income of the permanent fund and other sources. The expenditures for the year had been \$658,285. The missions are in Mexico, Spain, Austria, Turkey (European and Asiatic), India, Ceylon, China, Japan, the Sandwich Islands and Micronesia, and Africa (Zulu, West Central African, and East Central African missions). The following is the general summary of the entire work for 1885-'86:

Missions:.....	22
Stations.....	55
Out-stations.....	810
Ordained missionaries (10 being physicians).....	159
Physicians not ordained, 7 men and 4 women.....	11
Other male assistants.....	7
Women (wives, 136; unmarried, besides physicians, 101).....	257
Whole number of laborers sent from this country.....	494
Native pastors.....	151
Native preachers and catechists.....	412
Native school-teachers.....	1,141
Other native helpers.....	260—1,964
Whole number of laborers.....	2,398

Pages printed, as nearly as can be learned.....	15,145,716
Churches.....	310
Church-members.....	26,065
Added during the year.....	8,451
Whole number from the first, as nearly as can be learned.....	98,183
High-schools, theological seminaries, and station-classes.....	56
Pupils in the above.....	2,852
Boarding-school for girls.....	41
Pupils in boarding-school for girls.....	1,953
Common schools.....	836
Pupils in common schools.....	82,577
Whole number under instruction.....	89,877

American Missionary Association.—The fortieth anniversary of the American Missionary Association was held in New Haven, Conn., Oct. 19 to 21. The Hon. William B. Washburne, of Massachusetts, presided. The general receipts of the society for the year had been \$335,704; besides which \$3,000 had been added to the endowment fund, and receipts were returned by Berea College of \$25,644; by Hampton Institute, of \$91,905; and by Atlanta University, of \$10,100; making the total receipts \$466,353. The expenditures had been \$341,488; of which \$197,345 had been applied for churches, educational work, land, buildings, etc., in the South; \$11,756 for work among the Chinese; \$54,884 for work among the Indians; and \$6,065 for foreign missionary work.

The report of the missionary and educational work showed that the number of churches under the care of the Association was 124; that they were served by 117 missionaries, and returned 7,571 church-members; and that 1,088 persons had been received during the year on profession of faith. The number of pupils in Sunday-schools was 13,149. Twelve new churches had been organized during the year, and 2,500 had been added to the number of pupils in Sunday-schools. Fifty-three schools had been sustained, with 239 instructors and 8,753 pupils, classified as follows: Students of theology, 118; of law, 78; collegiate students, 53; collegiate preparatory, 95; normal students, 799; grammar grade, 1,597; intermediate, 2,348; primary, 3,766. Thirty-three of these schools were common schools, and were situated in North and South Carolina, Georgia, Florida, Alabama, Texas, Tennessee, Kentucky, and Arkansas. Fourteen of them were normal.

The Association had among the Indians 5 churches, with 348 members; 15 schools, with 685 pupils; and 56 missionaries and teachers. Its missions among the Chinese (in California) included 18 schools, with 1,279 pupils, and 34 missionaries; and returned 123 hopeful conversions.

Congregational Council.—The fifth triennial meeting of the Congregational Council was held in Chicago, Ill., beginning October 13. The Hon. L. A. Cook, of Connecticut, presided, assisted by the Rev. B. A. Jones, of Tennessee, and the Rev. J. K. McLean, D. D., of California. The secretary made a statistical report which showed that the churches associated in the Council numbered by the last summary 4,170. The gain in three years had been 234, or an average of 78 yearly. But the number of churches organ-

ized was 513, or a yearly average of 171; of these 513 churches, 76 were in the East (east of the east line of Ohio), 198 in the interior (between that line and the west line of Missouri), and 239 in the West; and of the last number 86 were in the Territory of Dakota. Of the members of all the churches, 216,118 were in the East, 126,206 in the interior, and 29,240 in the West—giving an average to each church of 39 members in the West, 81 in the interior, 141 in the East, and 100 for the whole country. The gain in the number of members of Sunday-schools had been greater in the last year than was ever before recorded. The rate of increase in the number of members of the Church did not keep pace with the increase of population of the country, but the number of infant baptisms was increasing. The gifts for benevolent purposes during the last ten years had averaged \$1,385,859 a year; or, if the "Slater gift" of \$1,000,000 be excluded from this account, the annual average would still be \$1,285,859. The increase in the gifts made in 1885 over those returned for 1884 was \$176,000. The "home expenditures" of the churches in the last year had exceeded \$4,000,000, and gave an average of \$1,442 to each reporting church. The total value of 2,515 churches was returned at \$24,607,476, representing an average of \$9,784 for each church. Parsonages were reported by 1,092 churches, with an average value of \$2,189. The average of the pastors' salaries reported by 2,230 churches was \$982, but this would have been reduced had returns been made by all the churches. Notice had been received of a bequest of \$10,000, which had been left by Mrs. Ellen C. Knowles, of Worcester, Mass., to be applied under the direction of the Council in aid of the aged or disabled ministers of the gospel, or their widows and orphan children. The gift was accepted, with expressions of grateful acknowledgment. A gift was also offered by Mr. Albert Curtis of \$15,000 toward the establishment of a home for disabled ministers, their wives and widows.

The following declaration was adopted on the subject of ministerial standing:

Resolved, That standing in the Congregational ministry is acquired by the fulfillment of these three conditions—viz: 1. Membership in a Congregational church; 2. Ordination to the Christian ministry; and, 3. Reception as an ordained minister into the fellowship of the Congregational churches, in accordance with the usage of the State or Territorial organization of churches in which the applicant may reside, and such standing is to be continued in accordance with these usages; it being understood that a *pro re nata* council is an ultimate resort in all questions.

Resolved, That all Congregational ministers in good standing in their respective States who have been installed by Council, or who have been regularly called to the pastorate by the specific vote of some church, have formally accepted such position, and have been recognized as such by some definite act of the Church, should be enrolled as pastors; and we advise that all our denominational statistics and direct that, as far as possible, our "Year-Book" shall conform to this principle.

Resolved, That the National Council commends to the churches, in accordance with our ancient usage,

the importance of properly called ecclesiastical councils ordinarily selected from the vicinage, and especially the great importance of installing ministers to the pastorate by councils where it is practicable and conducive to the purity of the ministry and the prosperity of the churches.

Resolved., That the State organizations and local organizations of churches are recommended to consider such modification of their constitution as will enable them to become responsible for the ministerial standing of ministers within their bounds, in harmony with the principle that the churches of any locality decide upon their own fellowship.

The committee on ministerial supply made a report showing that much of every minister's time was wasted in finding a pastorate, notwithstanding there was always a demand for pastors; suggesting that a bureau for the purpose of finding pastorates for unemployed ministers might be a useful institution; citing the fact that many ministers out of employment as pastors were engaged as superintendents, professors, etc., as evidence that not so large a number of ministers were idle as might otherwise seem to be; and hinting that the remedy for ministers staying unemployed might be gained by every minister wishing employment being "willing to go anywhere that the Lord his Master would have him go." A committee was appointed to confer with representatives of the Free-Will Baptist churches on the subject of union, and also "to seek and promote fellowship or union with any other body of Christians"; and a resolution was passed declaring "that we rejoice to acknowledge the fact that all Christians are members of the one Church of Christ, whatever be the form of their organization, and that we will gladly co-operate in every effort to make this fact visible to the world." The attention of Congress and the President of the United States was invited to the urgency of a revision of the laws governing marriage and divorce, particularly in the District of Columbia and the Territories; and other denominations were invited to co-operate with the Council in this matter. The employment of evangelists under the direction of State and local conferences and associations, to labor where called for, either by the churches or the needs of destitute localities, was commended and advised; and the theological seminaries were invited to provide a more adequate training of young men for this work. The Council resolved to urge upon Congress "the duty of making immediate payment of all well authenticated claims presented by the Chinese, and of making such pecuniary reparation for loss of life as may seem just; also that it is the duty of Congress to take measures for the punishment of those who have committed outrages upon the Chinese, and to take such other action as may seem advisable to render the lives and property of the Chinese as sure as the lives and property of other persons"; and the Provisional Council was instructed to make a suitable presentation of this subject. Efforts were resolved upon to obtain \$50,000 each for the Scandinavian and German departments of

the Chicago Theological Seminary; the same sum for the Slavic department at Oberlin; and \$100,000 as a "National Council Exigency Loan Fund," for establishing or aiding churches doing mission work in large cities and other important centers of population. A standing committee was appointed to observe the progress of the work of city evangelization. A standing committee on "systematic beneficence" was appointed, to promote, by conference and other means, the wise distribution of the offerings of the denomination for missionary purposes.

The "Andover Cases."—The preliminary hearing against five professors in Andover Theological Seminary—viz., Profs. Smyth, Tucker, Churchill, Harris, and Hincks—was begun before the Board of Visitors of the seminary in Boston, Oct. 25. The defendants were charged in the complaint with holding beliefs and having taught doctrines and theories, and done other things, which "are not in harmony with, but antagonistic to, the constitution and statutes of the seminary and the true intention of its founders, as expressed in those statutes"; also, that they were not men of sound and orthodox principles in divinity, according to the fundamental and distinguishing doctrines of the gospel, as summarily expressed in the Westminster Assembly's Shorter Catechism, and more particularly expressed in the creed of the seminary. More definitely, the indictment charged them with holding, maintaining, and inculcating—

1. That the Bible is not the only perfect rule of faith and practice, but is fallible and untrustworthy, even in some of its religious teachings.
2. That Christ, in the days of his humiliation, was merely a finite being, limited in all his attributes, capacities, and attainments.
3. That no man has power or capacity to repent without knowledge of the historic Christ.
4. That mankind, save as instructed in the knowledge of the historic Christ, are not sinners, or, if they are, not of such sinfulness as to be in danger of being lost.
5. That no man can be lost without having had knowledge of Christ.
6. That the atonement of Christ consists essentially and chiefly in his becoming identified with the human race through his incarnation, in order that by his union with men he might endow them with the power to repent, and thus impart to them an augmented value in the view of God, and so propitiate God to men and men to God.
7. That the Trinity is modal and not personal.
8. That the work of the Holy Spirit is mainly limited to natural methods and within historic Christianity.
9. That, without the knowledge of the historic Christ, men do not deserve the punishment of the law, and that, therefore, their salvation is not "wholly of grace."
10. That faith ought to be scientific and natural, rather than scriptural.
11. That there is and will be probation after death for all men who have not in this world had knowledge of the historic Christ.
12. That this hypothetical belief in probation after death should be brought to the front, exalted, and made central in theology and in the beliefs of men.
13. That Christian missions are not to be supported and conducted on the ground that men who know not

Christ are in danger of perishing forever and must perish forever unless saved in this life.

14. That a system of physical and metaphysical philosophy is true which, by fair inference, neutralizes the Christian doctrine as taught in the creed of the seminary.

15. That there is a "new theology better than the old," which we apprehend is not in harmony with the creed, but fatally opposed to the same.

16. That the said professors hold many things which can not be reconciled with that orthodox and consistent Calvinism which the statutes require of them, and to which they stand publicly committed, and that in repeated instances these professors have broken solemn promises made when they subscribed to the creed.

The counsel for the accused pleaded in answer to the charges, denying the jurisdiction of the Board of Visitors, which they held was not an original court, but had only appellate power; affirming that proceedings had been begun before the Board of Trustees of the Seminary, and were still pending; contending that the defendants, if tried, must be tried singly, and not in a body, and insisting that the charges were too indefinite. The Visitors decided, after hearing the arguments of counsel, that they had original jurisdiction in the premises; that no proceedings were pending in the Board of Trustees for the same alleged offense; and that the complainants were rightly before the board. But they directed that the charges should be amended so as to proceed against the respondents individually and separately; and that such charges as were indefinite should be made plain. A set of complaints, amended so as to present the charges in a more specific form, and with the support of citations from written or spoken expressions of the several defendants and applying separately to each of the five professors, was sent in to the Board of Visitors, according to its order, on the 8th of November. A motion to dismiss the cases was filed on the 27th of November, and denied by the board; and, after this, the formal answers of the defendants were filed. They comprehended denial of the charges as a whole, and pleas to the definiteness, relevancy, or sufficiency of the same severally.

The hearing in the cases was begun at Boston, Dec. 28, when the case of Prof. Smyth was taken up first, and the opening arguments were made. The hearing was concluded during the week, but the decision of the court had not yet been declared at the end of the year.

Congregational Statistics of England and Wales.—The numerical returns of the Congregational churches of England and Wales, as given in the "Congregational Year-Book" for 1886, showed that there were 4,384 churches, branch churches, and missionary stations, providing sitting accommodations for 1,582,400 adults. Twenty-four new churches had been formed during the year. The number of students under ministerial training in the institutions of the denomination (not including 300 native students in the ten institutions of the London Missionary Society) was 450. The London Missionary Society returned 162 English mis-

sionaries, 1,082 native ordained missionaries and pastors, 5,054 native preachers, 91,407 church-members, and 325,171 native adherents.

Congregational Union of England and Wales.—The fifty-fourth annual meeting of the Congregational Union of England and Wales was held in London, beginning May 10. The Rev. Edward White presided and delivered the opening address. The committee, in its annual report, remarked that, while political issues of first-rate importance had been before the nation, they having no direct bearing on the interests which the Union was set to protect, it had placed nothing on record with respect to them, except an expression of opinion that Sir R. Webster's bill did not deal satisfactorily with the question of nonconformist marriages. In regard to a contemplated joint meeting of the Baptist and Congregational Unions, the explanation was made that they ought not to be understood to be meetings in which one body receives the other as its guest, but as "strictly joint or mass meetings of the two bodies; that the occasion is not one for dealing with matters of faith and practice in which the two bodies differ; and that there is not behind the meeting any unrevealed scheme for the removal of denominational landmarks." The number of persons who had offered themselves for the examinations in religious knowledge, instituted by the Union, had diminished; and, in view of the comparative failure which appeared to have so far attended the efforts, it seemed desirable to consider whether some method might not be devised to make these examinations more attractive and useful. The financial statement showed balances in favor of the Union amounting to £9,334. The Assembly declared, by resolution, that, regarding the appointment of a royal commission on national education, as raising anew the question of the basis on which a national system of education should be placed, it renewed its protest "against the violation of the principle of religious equality involved in the present system," and affirmed that no system would be satisfactory under which national funds were appropriated to schools or training colleges "which, being of a sectarian character, are under the sole control of denominational managers." A special committee was appointed to consider the subject of social purity.

Church Aid Society.—The Congregational Church Aid Society reported that during the year it had assisted 697 churches and branch churches, and 334 evangelistic or mission stations, in all 1,031 congregations, having an attendance of 108,342 persons, of whom 37,270 were church-members. The grants amounted to £22,887, and the churches had raised from their own resources £33,722.

London Missionary Society.—The annual meeting of the London Missionary Society was held May 13. Mr. Edward Crossley, M. P., presided. The income of the society for the year had been £124,078. A debt of £11,400, with which

the year had been begun, had been cleared off. The society was not yet, however, paying its way, and, to balance expenses, the reserve fund would have to be drawn upon.

Joint Meeting of the Baptist and Congregational Unions.—A joint assembly of the Congregational and Baptist Unions was held May 14. The Rev. C. Williams, chairman of the Baptist Union, read a paper in which he remarked that as the two denominations had worked so long along the same lines in fighting the fight for religious equality, it was a matter of surprise that this should have been their first joint meeting. Their aim that day was not to assert themselves as denominations against other churches, or even to lay stress upon ecclesiastical peculiarities at all, but to stimulate one another to seek inward spiritual force. The Rev. Dr. Conder, Congregationalist, followed with a paper on "The Idea of a Christian Church held in Common by the Two Bodies"; the Rev. J. W. Lance, Baptist, read a paper on the promotion and preservation of truth by those true to the idea; and the Rev. Dr. Angus a paper on "Fidelity to the Idea in its Bearing on the Upraising of a Consecrated Christian Ministry." A resolution was passed expressing the concurrence of the meeting in the sentiments embodied in these four papers. The public evening meeting was presided over by the Rev. Edward White, chairman of the Congregational Union, who spoke of "The Great Cloud of Witnesses," as presented by the missionaries and others who were working for the spread of Christian truth in the mission-fields and other parts of the world. The Rev. Dr. Clifford spoke on "The New Democracy and the Old Testament"; the Rev. J. G. Rogers on Congregationalism as a "Church System"; the Rev. Edward Glover on "The Foreign Mission Work of the Churches"; and the Rev. Dr. Parker on "The Larger Congregationalism and the Larger England."

Autumnal Meeting of the Union.—The autumnal meeting of the Union was held at Norwich, October 12. The chairman, the Rev. Edward White, delivered the opening address on "Handling the Scriptures." The subject and relations of non-conformity were discussed in papers on "Non-conformity in the Reign of the Queen" (an historical review), by Mr. Albert Spicer; "The Influence and Progress of Non-conformity as a Spiritual Force," by the Rev. John Brown; "The Influence and Progress of Non-conformity as a Political Force," by Mr. Carvell Williams; and "The Work which lies before Non-conformity," by the Rev. Dr. Bruce; other papers were read on the "Need of Well-devised Arrangements for Correspondence concerning Pastoral Settlements," by the Rev. William Clarkson; "The Influence of the Churches on National Stability and Progress," by the Rev. Dr. Hannay; "Revival Missions," by Prof. Cave, the Rev. J. F. B. Tinling, and the Rev. R. Balgarnie; "Religion out of the Church," by the Rev. T. H. Hollowell; and "What Christ

has done for the People," by the Rev. G. R. Balgarnie. A minute was adopted upon the death of Mr. Samuel Morley, saying that he had been a beloved and honored fellow-worker with the Union during the last fifty years, and recognizing "the wisdom he had brought to council, the purity and force of his personal influence, his affluent liberality, and his work as a reformer in the diffusion of knowledge, of purity, of temperance, and of thrift, and in the abolition of unjust laws." The committee of the Union was instructed to prepare a suitable address to the Queen on the occasion of her jubilee year, expressing the loyalty of the Congregational people.

CONGRESS OF CHURCHES.—The second annual meeting of the American Congress of Churches was held in Cleveland, O., beginning May 25. The Hon. Joseph B. Foraker, Governor of Ohio, presided and made an opening address. The Rev. Dr. Joseph Andrews, chairman of the Council, made a report on "The First Year of the Congress," the first meeting having been held in Hartford in 1885, and in it reiterated a definition of the scope and purpose of the body. The purpose was not to establish a society or organize a plan of union or put forth a creed, but simply "by holding public meetings from time to time to make provision for a full and frank discussion of the great subjects in which the Christians of America are interested, including those ecclesiastical and theological questions upon which Christians differ," and it had been distinctly asserted in all the announcements of the Council that no intention was had of "excluding any church, or of expressing an opinion in regard to the relative value and excellence of any." The subject of "A True Church; its Essentials and its Characteristics," was discussed in papers by Mr. D. G. Porter and the Rev. Leonard W. Bacon, D. D. Upon the subject of "Religion in the Public Schools," papers were read by the Rev. Dr. D. S. Stephens; Bishop Gilmour, of Cleveland, who represented the position of the Roman Catholic Church; and the Rev. J. Coleman Adams. Other topics considered were "The Present Necessity of a Re-statement of Christian Beliefs," by the Rev. Daniel Curry, D. D., the Rev. E. P. Parker, D. D., the Rev. Reuben Jeffrey, D. D., the Rev. Otis A. Glazebrook, and the Rev. R. B. Tyler; "The Workingman's Distrust of the Church; its Causes and Remedies," by the Rev. Wayland Hoyt, D. D., Mr. John Jarrett, ex-President of the Amalgamated Iron and Steel Association, Mr. Henry George, the Rev. William Wilberforce Newton, and the Rev. E. S. Lorenz; "Re-adjustments of the Church to meet Modern Needs," 1. In the methods of dealing with and reaching the poor in cities, by the Rev. R. B. Tyler and the Rev. W. S. Rainsford, D. D.; 2. In country towns and on the frontier, by the Rev. S. W. Dike and the Rev. William Barrows, D. D.; 3. In foreign missionary fields, by the Rev. E. S. Lowrey and the Rev. Archdeacon W. W. Kirby.

CONGRESS OF THE UNITED STATES. On Monday, Dec. 7, 1885, the day prescribed by the Constitution for the annual meeting, the first session of the Forty-ninth Congress began.

The Senate, during the session, was composed of the following members, the term of each one expiring at the date given before his name:

<i>Alabama.</i>	<i>Massachusetts.</i>
1891. James L. Pugh, D.	1889. George F. Hoar, R.
1889. John T. Morgan, D.	1887. Henry L. Dawes, R.

<i>Arkansas.</i>	<i>Michigan.</i>
1891. James K. Jones, D.	1889. Thomas W. Palmer, R.
1889. James H. Berry, D. ¹	1887. Omar D. Conger, R.

<i>California.</i>	<i>Minnesota.</i>
1891. Leland Stanford, R.	1889. Dwight M. Sabin, R.
1887. George Hearst, D. ²	1887. S. J. R. McMillan, R.

<i>Colorado.</i>	<i>Mississippi.</i>
1891. Henry M. Teller, R.	1889. E. C. Walhall, D. ⁵
1889. Thomas M. Bowen, R.	1887. James Z. George, D.

<i>Connecticut.</i>	<i>Missouri.</i>
1891. Orville H. Platt, R.	1891. George G. Vest, D.
1887. Joseph R. Hawley, R.	1887. Francis M. Cockrell, D.

<i>Delaware.</i>	<i>Nebraska.</i>
1889. Eli Saulsbury, D.	1889. C. F. Manderson, R.
1887. George Gray, D. ³	1887. C. H. Van Wyck, R.

<i>Florida.</i>	<i>Nevada.</i>
1891. Wilkinson Call, D.	1891. John P. Jones, R.
1887. Charles W. Jones, D.	1887. James G. Fair, D.

<i>Georgia.</i>	<i>New Hampshire.</i>
1891. Joseph E. Brown, D.	1891. Henry W. Blaik, R. ⁶
1889. Alfred H. Colquitt, D.	1889. Austin F. Pike, R. ⁷

<i>Illinois.</i>	<i>New Jersey.</i>
1891. John A. Logan, R. ⁴	1889. John R. McPherson, D.
1889. Shelby M. Cullom, R.	1887. William J. Sewell, R.

<i>Indiana.</i>	<i>New York.</i>
1891. Daniel W. Voorhees, D.	1891. William M. Evarts, R.
1887. Benjamin Harrison, R.	1887. Warner Miller, R.

<i>Iowa.</i>	<i>North Carolina.</i>
1891. William B. Allison, R.	1891. Zebulon B. Vance, D.
1889. James F. Wilson, R.	1889. Matt. W. Ransom, D.

<i>Kansas.</i>	<i>Ohio.</i>
1891. John James Ingalls, R.	1891. Henry B. Payne, D.
1889. Preston B. Plumb, R.	1887. John Sherman, R.

<i>Kentucky.</i>	<i>Pennsylvania.</i>
1891. J. C. S. Blackburn, D.	1891. John H. Mitchell, R. ⁸
1889. James B. Beck, D.	1889. Joseph N. Dolph, R.

<i>Louisiana.</i>	<i>Rhode Island.</i>
1891. James B. Eustis, D.	1891. J. D. Cameron, R.
1889. Randall L. Gibson, D.	1887. John I. Mitchell, R.

<i>Maine.</i>	<i>South Carolina.</i>
1889. William P. Frye, R.	1889. Jonathan Chace, R.
1887. Eugene Hale, R.	1887. Nelson W. Aldrich, R.

<i>Maryland.</i>	<i>Tennessee.</i>
1891. Ephraim K. Wilson, D.	1891. Wade Hampton, D.
1887. Arthur P. Gorman, D.	1889. Matthew C. Butler, D.

¹ Qualified March 25, 1885, in place of Augustus H. Garland, resigned March 6, to become Attorney-General.

² Qualified April 9, 1886, to succeed John F. Miller, died March 8, 1886.

³ Qualified March 9, 1885, to take the place of Thomas F. Bayard, resigned March 6, 1885, to become Secretary of State.

⁴ Died Dec. 26, 1886.

⁵ Qualified March 12, 1885, in place of Lucius Q. C. Lamar, resigned to become Secretary of the Interior, March 6, 1885. Qualified Jan. 25, 1886, under election.

⁶ Qualified March 10, 1885, under Executive appointment, and Dec. 7, 1885, on credentials of election.

⁷ Died Oct. 8, 1886, succeeded by P. C. Cheney.

⁸ Qualified Dec. 17, 1885.

*Tennessee.**Virginia.*

1889. Isham G. Harris, D.	1890. H. H. Riddleberger, R.
1887. W. C. Whitthorne, D. ⁹	1887. William Mahone, R.

*Texas.**West Virginia.*

1889. Richard Coke, D.	1889. John E. Kenna, D.
1887. Samuel Bell Maxey, D.	1887. Johnson N. Camden, D.

*Vermont.**Wisconsin.*

1891. Justin S. Morrill, R.	1891. John C. Spooner, R.
1887. G. F. Edmunds, R.	1887. Philetus Sawyer, R.

Of the 76 members, 41 were Republicans and 35 Democrats. Dec. 7, 1885, John Sherman, of Ohio, was chosen President *pro tempore* of the Senate, by a vote of 34 to 29 cast for Isham G. Harris, of Tennessee.

The House of Representatives, during the session, was composed of 325 members, of whom 184 were Democrats, 139 Republicans, and 2 Greenback-Labor men. The following is the roll:

Alabama.

James T. Jones, D.	Thomas W. Sadler, D.
Hilary A. Herbert, D.	John M. Martin, D.
William C. Oates, D.	William H. Forney, D.
Alexander C. Davidson, D.	Joseph Wheeler, D.

Arkansas.

Poindexter Dunn, D.	John H. Rogers, D.
C. E. Breckenridge, D.	Samuel W. Peel, D.
Thomas C. McRae, D. ¹⁰	

California.

Barclay Henley, D.	W. W. Morrow, R.
J. A. Louttit, R.	Charles N. Felton, R.
Joseph McKenna, R.	H. H. Markham, R.

Colorado.

George G. Symes, R.

Connecticut.

John R. Buck, R.	John T. Wait, R.
Charles L. Mitchell, D.	Edward W. Seymour, D.

Delaware.

Charles B. Lore, D.

Florida.

Robert H. M. Davidson, D. Charles Dougherty, D.

Georgia.

Thomas M. Norwood, D.	James H. Blount, D.
Henry G. Turner, D.	Judson C. Clements, D.
Charles F. Crisp, D.	Seaborn Reese, D.
Henry R. Harris, D.	Allen D. Candler, D.
N. J. Hammond, D.	George T. Barnes, D.

Illinois.

Ransom W. Dunham, R.	William H. Neece, D.
Frank Lawler, D.	James M. Riggs, D.
James H. Ward, D.	William M. Springer, D.
George E. Adams, R.	Jonathan H. Rowell, R.

The House organized by electing John G. Carlisle, of Kentucky, Speaker. There were 178 votes cast for him against 138 cast for Thomas B. Reed, of Maine. John B. Clark, Jr., of Missouri, was chosen Clerk; John P. Leedom, of Ohio, Sergeant-at-Arms; Lycurgus Dalton, of Indiana, Postmaster; Samuel Donelson, of Tennessee, Doorkeeper; and W. H. Milburn, of New York, Chaplain.

President's Message.—The President's annual message was submitted to Congress Dec. 8, 1885, and was as follows:

To the Congress of the United States:

Your assembling is clouded by a sense of public bereavement, caused by the recent and sudden death of Thomas A. Hendricks, Vice-President of the United States. His distinguished public services, his complete integrity and devotion to every duty, and his personal virtues, will find honorable record in his country's history.

Amply and repeated proofs of the esteem and confidence in which he was held by his fellow countrymen were manifested by election to offices of the most important trust and highest dignity; and at length, full of years and honors, he has been laid at rest amid universal sorrow and benediction.

The Constitution which requires those chosen to legislate for the people to annually meet in the discharge of their solemn trust also requires the President to give to Congress information of the state of the Union, and recommend to their consideration such measures as he shall deem necessary and expedient. At the threshold of a compliance with these constitutional directions, it is well for us to bear in mind that our usefulness to the people's interests will be promoted by a constant appreciation of the scope and character of our respective duties as they relate to Federal legislation. While the Executive may recommend such measures as he shall deem expedient, the responsibility for legislative action must and should rest upon those selected by the people to make their laws.

Contemplation of the grave and responsible functions assigned to the respective branches of the Government under the Constitution will disclose the partitions of power between our respective departments and their necessary independence, and also the need for the exercise of all the power intrusted to each in

that spirit of comity and co-operation which is essential to the proper fulfillment of the patriotic obligations which rest upon us as faithful servants of the people.

The jealous watchfulness of our constituencies, great and small, supplements their suffrages, and before the tribunal they establish every public servant should be judged.

It is gratifying to announce that the relations of the United States with all foreign powers continue to be friendly. Our position after nearly a century of successful constitutional government, maintenance of good faith in all our engagements, the avoidance of complications with other nations, and our consistent and amicable attitude toward the strong and weak alike, furnish proof of a political disposition which renders professions of good will unnecessary. There are no questions of difficulty pending with any foreign government.

The Argentine Government has revived the long dormant question of the Falkland Islands, by claiming from the United States indemnity for their loss, attributed to the action of the commander of the sloop-of-war "Lexington" in breaking up a piratical colony on those islands in 1881, and their subsequent occupation by Great Britain. In view of the ample justification for the act of the "Lexington," and the derelict condition of the islands before and after their alleged occupation by Argentine colonists, this Government considers the claim as wholly groundless.

Question has arisen with the Government of Austria-Hungary touching the representation of the United States at Vienna. Having, under my constitutional prerogative, appointed an estimable citizen of unimpeached probity and competence as minister at that court, the Government of Austria-Hungary invited this Government to take cognizance of certain exceptions, based upon allegations against the personal acceptability of Mr. Keiley, the appointed envoy, asking that, in view thereof, the appointment should be withdrawn. The reasons advanced were such as could not be acquiesced in without violation of my oath of office and the precepts of the Constitution, since they necessarily involved a limitation in favor of a foreign government upon the right of selection by the Executive, and required such an application of a religious test as a qualification for office under the United States as would have resulted in the practical disfranchisement of a large class of our citizens and the abandonment of a vital principle in our Government. The Austro-Hungarian Government finally decided not to receive Mr. Keiley as the envoy of the United States, and that gentleman has since resigned his commission, leaving the post vacant. I have made no new nomination, and the interests of this Government at Vienna are now in the care of the secretary of legation, acting as chargé d'affaires *ad interim*.

Early in March last, war broke out in Central America, caused by the attempt of Guatemala to consolidate the several states into a single government. In these contests between our neighboring states the United States forbore to interfere actively, but lent the aid of their friendly offices in deprecation of war and to promote peace and concord among the belligerents, and by such counsel contributed importantly to the restoration of tranquility in that locality.

Emergencies growing out of civil war in the United States of Colombia demanded of the Government at the beginning of this administration the employment of armed force to fulfill its guarantees under the thirty-fifth article of the treaty of 1846, in order to keep the transit open across the Isthmus of Panama. Desirous of exercising only the powers expressly reserved to us by the treaty, and mindful of the rights of Colombia, the forces sent to the Isthmus were instructed to confine their action to "positively and efficaciously" preventing the transit and its accessories from being "interrupted or embarrassed."

The execution of this delicate and responsible task

¹ Qualified March 18, 1886, in place of Joseph Rankin, died Jan. 14, 1886.

² Died Dec. 6, 1886.

necessarily involved police control where the local authority was temporarily powerless, but always in aid of the sovereignty of Colombia.

The prompt and successful fulfillment of its duty by this Government was highly appreciated by the Government of Colombia, and has been followed by expressions of its satisfaction.

High praise is due to the officers and men engaged in this service.

The restoration of peace on the Isthmus by the re-establishment of the constituted government there being thus accomplished, the forces of the United States were withdrawn.

Pending these occurrences, a question of much importance was presented by decrees of the Colombian Government, proclaiming the closure of certain ports then in the hands of insurgents, and declaring vessels held by the revolutionists to be piratical and liable to capture by any power. To neither of these propositions could the United States assent. An effective closure of ports not in the possession of the Government, but held by hostile partisans, could not be recognized; neither could the vessels of insurgents against the legitimate sovereignty be deemed *hostes humani generis* within the precepts of international law, whatever might be the definition and penalty of their acts under the municipal law of the state against whose authority they were in revolt. The denial by this Government of the Colombian propositions did not, however, imply the admission of a belligerent status on the part of the insurgents.

The Colombian Government has expressed its willingness to negotiate conventions for the adjustment by arbitration of claims by foreign citizens arising out of the destruction of the city of Aspinwall by the insurrectionary forces.

The interest of the United States in a practicable transit for ships across the strip of land separating the Atlantic from the Pacific has been repeatedly manifested during the last half-century.

My immediate predecessor caused to be negotiated with Nicaragua a treaty for the construction by and at the sole cost of the United States of a canal through Nicaraguan territory, and laid it before the Senate. Pending the action of that body thereon, I withdrew the treaty for re-examination. Attentive consideration of its provisions leads me to withhold it from resubmission to the Senate.

Maintaining, as I do, the tenets of a line of precedents from Washington's day, which proscribe entangling alliances with foreign states, I do not favor a policy of acquisition of new and distant territory or the incorporation of remote interests with our own.

The laws of progress are vital and organic, and we must be conscious of that irresistible tide of commercial expansion which, as the concomitant of our active civilization, day by day, is being urged onward by those increasing facilities of production, transportation, and communication to which steam and electricity have given birth; but our duty in the present instructs us to address ourselves mainly to the development of the vast resources of the great area committed to our charge, and to the cultivation of the arts of peace within our own borders, though jealously alert in preventing the American hemisphere from being involved in the political problems and complications of distant governments. Therefore, I am unable to recommend propositions involving paramount privileges of ownership or right outside of our own territory, when coupled with absolute and unlimited engagements to defend the territorial integrity of the state where such interests lie. While the general project of connecting the two oceans by means of a canal is to be encouraged, I am of opinion that any scheme to that end to be considered with favor should be free from the features alluded to.

The Tehuantepec route is declared by engineers of the highest repute and by competent scientists to afford an entirely practicable transit for vessels and cargoes, by means of a ship-railway, from the Atlan-

tic to the Pacific. The obvious advantages of such a route, if feasible, over others more remote from the axial lines of traffic between Europe and the Pacific, and particularly between the valley of the Mississippi and the western coast of North and South America, are deserving of consideration.

Whatever highway may be constructed across the barrier dividing the two greatest maritime areas of the world must be for the world's benefit, a trust for mankind, to be removed from the chance of domination by any single power, nor become a point of invitation for hostilities or a prize for warlike ambition. An engagement combining the construction, ownership, and operation of such a work by this Government, with an offensive and defensive alliance for its protection, with the foreign state whose responsibilities and rights we would share, is in my judgment inconsistent with such dedication to universal and neutral use, and would, moreover, entail measures for its realization beyond the scope of our national polity or present means.

The lapse of years has abundantly confirmed the wisdom and foresight of those earlier administrations which, long before the conditions of maritime intercourse were changed and enlarged by the progress of the age, proclaimed the vital need of interoceanic transit across the American Isthmus, and consecrated it in advance to the common use of mankind by their positive declarations and through the formal obligation of treaties. Toward such realization the efforts of my administration will be applied, ever bearing in mind the principles on which it must rest, and which were declared in no uncertain tones by Mr. Cass, who, while Secretary of State, in 1858, announced that "what the United States want in Central America, next to the happiness of its people, is the security and neutrality of the interoceanic routes which lead through it."

The construction of three transcontinental lines of railway, all in successful operation, wholly within our territory, and uniting the Atlantic and the Pacific Oceans, has been accompanied by results of a most interesting and impressive nature, and has created new conditions, not in the routes of commerce only, but in political geography, which powerfully affect our relations toward, and necessarily increase our interests in, any transisthmian route which may be opened and employed for the ends of peace and traffic, or in other contingencies, for uses inimical to both.

Transportation is a factor in the cost of commodities scarcely second to that of their production, and weighs as heavily upon the consumer.

Our experience already has proved the great importance of having the competition between land-carriage and water-carriage fully developed, each acting as a protection to the public against the tendencies to monopoly which is inherent in the consolidation of wealth and power in the hands of vast corporations.

These suggestions may serve to emphasize what I have already said on the score of the necessity of a neutralization of any interoceanic transit; and this can only be accomplished by making the uses of the route open to all nations and subject to the ambitions and warlike necessities of none.

The drawings and report of a recent survey of the Nicaragua Canal route, made by Chief-Engineer Menocal, will be communicated for your information.

The claims of citizens of the United States for losses by reason of the late military operations of Chili, in Peru, and Bolivia, are the subject of negotiation for a claims convention with Chili, providing for their submission to arbitration.

The harmony of our relations with China is fully sustained.

In the application of the acts lately passed to execute the treaty of 1880, restrictive of the immigration of Chinese laborers into the United States, individual cases of hardship have occurred beyond the power of the Executive to remedy, and calling for judicial determination.

The condition of the Chinese question in the Western States and Territories is, despite this restrictive legislation, far from being satisfactory. The recent outbreak in Wyoming Territory, where numbers of unoffending Chinamen, indisputably within the protection of the treaties and the law, were murdered by a mob, and the still more recent threatened outbreak of the same character in Washington Territory, are fresh in the minds of all, and there is apprehension lest the bitterness of feeling against the Mongolian race on the Pacific slope may find vent in similar lawless demonstrations. All the power of this Government should be exerted to maintain the amplest good faith toward China in the treatment of these men, and the inflexible sternness of the law in bringing the wrong-doers to justice should be insisted upon.

Every effort has been made by this Government to prevent these violent outbreaks and to aid the representatives of China in their investigation of these outrages; and it is but just to say that they are traceable to the lawlessness of men not citizens of the United States engaged in competition with Chinese laborers.

Race prejudice is the chief factor in originating these disturbances, and it exists in a large part of our domain, jeopardizing our domestic peace and the good relationship we strive to maintain with China.

The admitted right of a government to prevent the influx of elements hostile to its internal peace and security may not be questioned, even where there is no treaty stipulation on the subject. That the exclusion of Chinese labor is demanded in other countries where like conditions prevail, is strongly evidenced in the Dominion of Canada, where Chinese immigration is now regulated by laws more exclusive than our own. If existing laws are inadequate to compass the end in view, I shall be prepared to give earnest consideration to any further remedial measures, within the treaty limits, which the wisdom of Congress may devise.

The independent state of the Congo has been organized as a government, under the sovereignty of his Majesty the King of the Belgians, who assumes his chief magistracy in his personal character only, without making the new state a dependency of Belgium. It is fortunate that a benighted region, owing all it has of quickening civilization to the beneficence and philanthropic spirit of this monarch, should have the advantage and security of his benevolent supervision.

The action taken by this Government last year in being the first to recognize the flag of the International Association of the Congo has been followed by formal recognition of the new nationality which succeeds to its sovereign powers.

A conference of delegates of the principal commercial nations was held at Berlin last winter, to discuss methods whereby the Congo Basin might be kept open to the world's trade. Delegates attended on behalf of the United States on the understanding that their part should be merely deliberative, without imparting to the results any binding character so far as the United States were concerned. This reserve was due to the indisposition of this Government to share in any disposal by an international congress of jurisdictional questions in remote foreign territories. The results of the conference were embodied in a formal act of the nature of an international convention, which laid down certain obligations purporting to be binding on the signatories, subject to ratification within one year. Notwithstanding the reservation under which the delegates of the United States attended, their signatures were attached to the general act in the same manner as those of the plenipotentiaries of other governments, thus making the United States appear, without reserve or qualification, as signatories to a joint international engagement imposing on the signers the conservation of the territorial integrity of distant regions where we have no established interests or control.

This Government does not, however, regard its

reservation of liberty of action in the premises as at all impaired; and holding that an engagement to share in the obligation of enforcing neutrality in the remote valley of the Congo would be an alliance whose responsibilities we are not in a position to assume, I abstain from asking the sanction of the Senate to that general act.

The correspondence will be laid before you, and the instructive and interesting report of the agent sent by this Government to the Congo country, and his recommendations for the establishment of commercial agencies on the African coast are also submitted for your consideration.

The commission appointed by my predecessor last winter to visit the Central and South American countries and report on the methods of enlarging the commercial relations of the United States therewith, has submitted reports, which will be laid before you.

No opportunity has been omitted to testify the friendliness of this Government toward Corea, whose entrance into the family of treaty powers the United States were the first to recognize. I regard with favor the application made by the Corean Government to be allowed to employ American officers as military instructors, to which the assent of Congress becomes necessary, and I am happy to say this request has the concurrent sanction of China and Japan.

The arrest and imprisonment of Julio R. Santos, a citizen of the United States, by the authorities of Ecuador, gave rise to contention with that Government, in which his right to be released or to have a speedy and impartial trial on announced charges, and with all guarantees of defense stipulated by treaty, was insisted upon by us. After an elaborate correspondence, and repeated and earnest representations on our part, Mr. Santos was, after an alleged trial and conviction, eventually included in a general decree of amnesty and pardoned by the Ecuadorian Executive and released, leaving the question of his American citizenship denied by the Ecuadorian Government, but insisted upon by our own.

The amount adjudged by the late French and American Claims Commission to be due from the United States to French claimants on account of injuries suffered by them during the war of secession, having been appropriated by the last Congress, has been duly paid to the French Government.

The act of Feb. 25, 1885, provided for a preliminary search of the records of French prize-courts for evidence bearing on the claims of American citizens against France for spoliations committed prior to 1801. The duty has been performed, and the report of the agent will be laid before you.

I regret to say that the restrictions upon the importation of our pork into France continue, notwithstanding the abundant demonstration of the absence of sanitary danger in its use; but I entertain strong hopes that, with a better understanding of the matter, this vexatious prohibition will be removed. It would be pleasing to be able to say as much with respect to Germany, Austria, and other countries, where such food-products are absolutely excluded without present prospect of reasonable change.

The interpretation of our existing treaties of naturalization by Germany during the past year, has attracted attention by reason of an apparent tendency on the part of the Imperial Government to extend the scope of the residential restrictions to which returning naturalized citizens of German origin are asserted to be liable under the laws of the empire. The temperate and just attitude taken by this Government with regard to this class of questions will doubtless lead to a satisfactory understanding.

The dispute of Germany and Spain relative to the domination of the Caroline Islands has attracted the attention of this Government, by reason of extensive interests of American citizens having grown up in those parts during the past thirty years; and because the question of ownership involves jurisdiction of matters affecting the status of our citizens under civil

and criminal law. While standing wholly aloof from the proprietary issues raised between powers to both of which the United States are friendly, this Government expects that nothing in the present contention shall unfavorably affect our citizens carrying on a peaceful commerce or there domiciled, and has so informed the Governments of Spain and Germany.

The marked good-will between the United States and Great Britain has been maintained during the past year.

The termination of the fishing clauses of the Treaty of Washington, in pursuance of the joint resolution of March 3, 1833, must have resulted in the abrupt cessation on the 1st of July of this year, in the midst of their ventures, of the operations of citizens of the United States engaged in fishing in British-American waters, but for a diplomatic understanding reached with her Majesty's Government in June last, whereby assurance was obtained that no interruption of those operations should take place during the current fishing season.

In the interest of good neighborhood and of the commercial intercourse of adjacent communities, the question of the North American fisheries is one of much importance. Following out the intimation given by me when the extorsory arrangement above described was negotiated, I recommend that the Congress provide for the appointment of a commission in which the Governments of the United States and Great Britain shall be respectively represented, charged with the consideration and settlement, upon a just, equitable, and honorable basis, of the entire question of the fishing rights of the two Governments and their respective citizens on the coasts of the United States and British North America. The fish-interests being intimately related to other general questions dependent upon contiguity and intercourse, consideration thereof, in all their equities, might also properly come within the purview of such a commission, and the fullest latitude of expression on both sides should be permitted.

The correspondence in relation to the fishing rights will be submitted.

The Arctic exploring steamer "Alert," which was generously given by her Majesty's Government to aid in the relief of the Greely expedition, was, after the successful attainment of that humane purpose, returned to Great Britain, in pursuance of the authority conferred by the act of March 3, 1855.

The inadequacy of the existing engagements for extradition between the United States and Great Britain has been long apparent. The tenth article of the treaty of 1842, one of the earliest compacts in this regard entered into by us, stipulated for surrender in respect of a limited number of offenses. Other crimes, no less inimical to the social welfare, should be embraced, and the procedure of extradition brought in harmony with present international practice. Negotiations with her Majesty's Government for an enlarged treaty of extradition have been pending since 1870, and I entertain strong hopes that a satisfactory result may be soon attained.

The frontier line between Alaska and British Columbia, as defined by the treaty of cession with Russia, follows the demarcation assigned in a prior treaty between Great Britain and Russia. Modern exploration discloses that this ancient boundary is impracticable as a geographical fact. In the unsettled condition of that region the question has lacked importance, but the discovery of mineral wealth in the territory the line is supposed to traverse admonishes that the time has come when an accurate knowledge of the boundary is needful to avert jurisdictional complications. I recommend, therefore, that provision be made for a preliminary reconnaissance by officers of the United States, to the end of acquiring more precise information on the subject. I have invited her Majesty's Government to consider with us the adoption of a more convenient line, to be established by meridian observations or by known geo-

graphical features, without the necessity of an expensive survey of the whole.

The late insurrectionary movements in Hayti having been quelled, the Government of that republic has made prompt provision for adjudicating the losses suffered by foreigners because of hostilities there, and the claims of certain citizens of the United States will be in this manner determined.

The long-pending claims of two citizens of the United States, Pelletier and Lazare, have been disposed of by arbitration, and an award in favor of each claimant has been made, which, by the terms of the engagement, is final. It remains for Congress to provide for the payment of the stipulated moiety of the expenses.

A question arose with Hayti during the past year, by reason of the exceptional treatment of an American citizen, Mr. Van Bokkelen, a resident of Port-au-Prince, who, on suit by creditors residing in the United States, was sentenced to imprisonment, and, under the operation of a Haytian statute, was denied relief secured to a native Haytian. This Government asserted his treaty right to equal treatment with natives of Hayti in all suits at law. Our contention was denied by the Haytian Government, which, however, while still professing to maintain the ground taken against Mr. Van Bokkelen's right, terminated the controversy by setting him at liberty without explanation.

An international conference to consider the means of arresting the spread of cholera and other epidemic diseases was held at Rome in May last, and adjourned to meet again on further notice. An expert delegate on behalf of the United States has attended its sessions and will submit a report.

Our relations with Mexico continue to be most cordial, as befits those of neighbors between whom the strongest ties of friendship and commercial intimacy exist, as the natural and growing consequence of our similarity of institutions and geographical propinquity.

The relocation of the boundary-line between the United States and Mexico westward of the Rio Grande, under the convention of July 29, 1852, has been unavoidably delayed; but I apprehend no difficulty in securing a prolongation of the period for its accomplishment.

The lately concluded commercial treaty with Mexico still awaits the stipulated legislation to carry its provisions into effect, for which one year's additional time has been secured by a supplementary article signed in February last and since ratified on both sides.

As this convention, so important to the commercial welfare of the two adjoining countries, has been constitutionally confirmed by the treaty-making branch, I express the hope that legislation needed to make it effective may not be long delayed.

The large influx of capital and enterprise to Mexico from the United States continues to aid in the development of the resources and in augmenting the material well-being of our sister republic. Lines of railway, penetrating to the heart and capital of the country, bring the two peoples into mutually beneficial intercourse, and enlarged facilities of transit add to profitable commerce, create new markets, and furnish avenues to otherwise isolated communities.

I have already adverted to the suggested construction of a ship-railway across the narrow formation of the territory of Mexico at Tehuantepec.

With the gradual recovery of Peru from the effects of her late disastrous conflict with Chili, and with the restoration of civil authority in that distracted country, it is hoped that pending war-claims of our citizens will be adjusted.

In conformity with notification given by the Government of Peru, the existing treaties of commerce and extradition between the United States and that country will terminate March 31, 1886.

Our good relationship with Russia continues.

An officer of the Navy, detailed for the purpose, is now on his way to Siberia, bearing the testimonials

voted by Congress to those who generously succored the survivors of the unfortunate "Jeannette" expedition.

It is gratifying to advert to the cordiality of our intercourse with Spain.

The long-pending claim of the owners of the ship "Masonic," for loss suffered through the admitted dereliction of the Spanish authorities in the Philippine Islands, has been adjusted by arbitration, and an indemnity awarded. The principle of arbitration in such cases, to which the United States have long and consistently adhered, thus receives a fresh and gratifying confirmation.

Other questions with Spain have been disposed of or are under diplomatic consideration with a view to just and honorable settlement.

The operation of the commercial agreement with Spain, of January 2—February 13, 1884, has been found inadequate to the commercial needs of the United States and the Spanish Antilles, and the terms of the agreement are subjected to conflicting interpretations in those islands.

Negotiations have been instituted at Madrid for a full treaty, not open to these objections, and in the line of the general policy touching the neighborly intercourse of proximate communities, to which I elsewhere advert, and aiming, moreover, at the removal of existing burdens and annoying restrictions; and although a satisfactory termination is promised, I am compelled to delay its announcement.

An international copyright conference was held at Berne in September, on the invitation of the Swiss Government. The envoy of the United States attended as a delegate, but refrained from committing this Government to the results, even by signing the recommedatory protocol adopted. The interesting and important subject of international copyright has been before you for several years. Action is certainly desirable to effect the object in view; and while there may be question as to the relative advantage of treating it by legislation or by specific treaty, the matured views of the Berne conference can not fail to aid your consideration on the subject.

The termination of the commercial treaty of 1862 between the United States and Turkey has been sought by that Government. While there is question as to the sufficiency of the notice of termination given, yet as the commercial rights of our citizens in Turkey come under the favored-nation guarantees of the prior treaty of 1830, and as equal treatment is admitted by the Porte, no inconvenience can result from the assent of this Government to the revision of the Ottoman tariffs, in which the treaty powers have been invited to join.

Questions concerning our citizens in Turkey may be affected by the Porte's non-acquiescence in the right of expatriation and by the imposition of religious tests as a condition of residence, in which this Government can not concur. The United States must hold, in their intercourse with every power, that the status of their citizens is to be respected and equal civil privileges accorded to them without regard to creed, and affected by no considerations save those growing out of domiciliary return to the land of original allegiance, or of unfulfilled personal obligations which may survive, under municipal laws, after such voluntary return.

The negotiation with Venezuela relative to the re-hearing of the awards of the Mixed Commission constituted under the treaty of 1865 was resumed in view of the recent acquiescence of the Venezuelan envoy in the principal point advanced by this Government, that the effects of the old treaty could only be set aside by the operation of a new convention. A result in substantial accord with the advisory suggestions contained in the joint resolution of March 3, 1883, has been agreed upon and will shortly be submitted to the Senate for ratification.

Under section 3659 of the Revised Statutes, all funds held in trust by the United States and the annual in-

terest accruing thereon when not otherwise required by treaty, are to be invested in stocks of the United States bearing a rate of interest not less than 5 per cent. per annum. There being now no procurable stocks paying so high a rate of interest, the letter of the statute is at present inapplicable, but its spirit is subserved by continuing to make investments of this nature in current stocks bearing the highest interest now paid. The statute, however, makes no provision for the disposal of such accretions. It being contrary to the general rule of this Government to allow interest on claims, I recommend the repeal of the provision in question, and the disposition, under a uniform rule, of the present accumulations from investment of trust funds.

The inadequacy of existing legislation touching citizenship and naturalization demands your consideration.

While recognizing the right of expatriation, no statutory provision exists providing means for renouncing citizenship by an American citizen, native-born or naturalized, nor for terminating and vacating an improper acquisition of citizenship. Even a fraudulent decree of naturalization can not now be canceled. The privilege and franchise of American citizenship should be granted with care, and extended to those only who intend in good faith to assume its duties and responsibilities when attaining its privileges and benefits; it should be withheld from those who merely go through the forms of naturalization with the intent of escaping the duties of their original allegiance without taking upon themselves those of their new status, or who may acquire the rights of American citizenship for no other than a hostile purpose toward their original governments. These evils have had many flagrant illustrations.

I regard with favor the suggestion put forth by one of my predecessors, that provision be made for a central bureau of record of the decrees of naturalization granted by the various courts throughout the United States now invested with that power.

The rights which spring from domicile in the United States, especially when coupled with a declaration of intention to become a citizen, are worthy of definition by statute. The stranger coming hither with intent to remain, establishing his residence in our midst, contributing to the general welfare, and by his voluntary act declaring his purpose to assume the responsibilities of citizenship, thereby gains an inchoate status which legislation may properly define. The laws of certain States and Territories admit a domiciled alien to the local franchise, conferring on him the rights of citizenship to a degree which places him in the anomalous position of being a citizen of a State, and yet not of the United States, within the purview of Federal and international law.

It is important within the scope of national legislation to define this right of alien domicile as distinguished from Federal naturalization.

The commercial relations of the United States with their immediate neighbors and with important areas of traffic near our shores, suggest especially liberal intercourse between them and us.

Following the treaty of 1883 with Mexico, which rested on the basis of a reciprocal exemption from customs duties, other similar treaties were initiated by my predecessor.

Recognizing the need of less obstructed traffic with Cuba and Porto Rico, and met by the desire of Spain to succor languishing interests in the Antilles, steps were taken to attain those ends by a treaty of commerce. A similar treaty was afterward signed by the Dominican Republic. Subsequently overtures were made by her Britannic Majesty's Government for a like mutual extension of commercial intercourse with the British West Indian and South American dependencies, but without result.

On taking office, I withdrew for re-examination the treaties signed with Spain and Santo Domingo, then pending before the Senate. The result has been to

satisfy me of the inexpediency of entering into engagements of this character not covering the entire traffic.

These treaties contemplated the surrender by the United States of large revenues for inadequate considerations. Upon sugar alone duties were surrendered to an amount far exceeding all the advantages offered in exchange. Even were it intended to relieve our consumers, it was evident that, so long as the exemption but partially covered our importation, such relief would be illusory. To relinquish a revenue so essential seemed highly improvident at a time when new and large drains upon the Treasury were contemplated. Moreover, embarrassing questions would have arisen under the favored-nation clauses of treaties with other nations.

As a further objection, it is evident that tariff regulation by treaty diminishes that independent control over its own revenues which is essential for the safety and welfare of any government. Emergency calling for an increase of taxation may at any time arise, and no engagement with a foreign power should exist to hamper the action of the Government.

By the fourteenth section of the shipping act, approved June 26, 1884, certain reductions and contingent exemptions from tonnage dues were made as to vessels entering ports of the United States from any foreign port in North and Central America, the West India Islands, the Bahamas and Bermudas, Mexico, and the Isthmus as far as Aspinwall and Panama. The Governments of Belgium, Denmark, Germany, Portugal, and Sweden and Norway have asserted, under the favored-nation clause in their treaties with the United States, a claim to like treatment in respect of vessels coming to the United States from their home ports. This Government, however, holds that the privileges granted by the act are purely geographical, inuring to any vessel of any foreign power that may choose to engage in traffic between this country and any port within the defined zone, and no warrant exists under the most-favored-nation clause for the extension of the privileges in question to vessels sailing to this country from ports outside the limitation of the act.

Undoubtedly the relations of commerce with our near neighbors, whose territories form so long a frontier line difficult to be guarded, and who find in our country and equally offer to us natural markets, demand special and considerate treatment. It rests with Congress to consider what legislative action may increase facilities of intercourse which contiguity makes natural and desirable.

I earnestly urge that Congress recast the appropriations for the maintenance of the diplomatic and consular service on a footing commensurate with the importance of our national interests. At every post where a representative is necessary, the salary should be so graded as to permit him to live with comfort. With the assignment of adequate salaries the so-called notarial extra-official fees, which our officers abroad are now permitted to treat as personal perquisites, should be done away with. Every act requiring the certification and seal of the officer should be taxable at schedule rates and the fee therefor returned to the Treasury. By restoring these revenues to the public use the consular service would be self-supporting, even with a liberal increase of the present low salaries.

In further prevention of abuses a system of consular inspection should be instituted.

The appointment of a limited number of secretaries of legation at large, to be assigned to duty wherever necessary, and in particular for temporary service at missions which for any cause may be without a head, should also be authorized.

I favor, also, authorization for the detail of officers of the regular service as military or naval attachés at legations.

Some foreign governments do not recognize the union of consular with diplomatic functions. Italy

and Venezuela will only receive the appointee in one of his two capacities; but this does not prevent the requirement of a bond and submission to the responsibilities of an office whose duties he can not discharge. The superadded title of consul-general should be abandoned at all missions.

I deem it expedient that a well-devised measure for the reorganization of the extra-territorial courts in Oriental countries should replace the present system, which labors under the disadvantage of combining judicial and executive functions in the same office.

In several Oriental countries generous offers have been made of premises for housing the legations of the United States. A grant of land for that purpose was made some years since by Japan, and has been referred to in the annual messages of my predecessor. The Siamese Government has made a gift to the United States of commodious quarters in Bangkok. In Corea, the late minister was permitted to purchase a building from the Government for legation use. In China, the premises rented for the legation are favored as to local charges. At Tangier, the house occupied by our representative has been for many years the property of this Government, having been given for that purpose in 1822 by the Sultan of Morocco. I approve the suggestion heretofore made, that, in view of the conditions of life and administration in the Eastern countries, the legation buildings in China, Japan, Corea, Siam, and perhaps Persia, should be owned and furnished by the Government, with a view to permanency and security. To this end I recommend that authority be given to accept the gifts adverted to in Japan and Siam, and to purchase in the other countries named, with provision for furniture and repairs. A considerable saving in rentals would result.

The World's Industrial Exposition, held at New Orleans last winter, with the assistance of the Federal Government, attracted a large number of foreign exhibits, and proved of great value in spreading among the concourse of visitors from Mexico and Central and South America a wider knowledge of the varied manufactures and productions of this country and their availability in exchange for the productions of those regions.

Past Congresses have had under consideration the advisability of abolishing the discrimination made by the tariff laws in favor of the works of American artists. The odium of the policy which subjects to a high rate of duty the paintings of foreign artists and exempts the productions of American artists residing abroad, and who receive gratuitously advantages and instruction, is visited upon our citizens engaged in art culture in Europe, and has caused them, with practical unanimity, to favor the abolition of such an ungracious distinction; and in their interest, and for other obvious reasons, I strongly recommend it.

The report of the Secretary of the Treasury fully exhibits the condition of the public finances and of the several branches of the Government connected with his department. The suggestions of the Secretary relating to the practical operations of this important department, and his recommendations in the direction of simplification and economy, particularly in the work of collecting customs duties, are especially urged upon the attention of Congress.

The ordinary receipts from all sources for the fiscal year ended June 30, 1885, were \$322,690,706.38. Of this sum \$181,471,939.34 was received from customs and \$112,498,725.54 from internal revenue. The total receipts, as given above, were \$24,829,163.54 less than those for the year ended June 30, 1884. This diminution embraces a falling off of \$13,595,550.42 in the receipts from customs and \$9,687,346.97 in the receipts from internal revenue.

The total ordinary expenditures of the Government for the fiscal year were \$260,226,935.50, leaving a surplus in the Treasury at the close of the year of \$63,463,771.27. This is \$40,929,854.32 less than the surplus reported at the close of the previous year.

The expenditures are classified as follow:

For civil expenses.....	\$23,826,942	11
For foreign intercourse.....	5,439,609	11
For Indians.....	6,559,494	63
For pensions.....	56,102,267	49
For the military, including river and harbor improvements and arsenals.....	42,670,578	47
For the navy, including vessels, machinery, and improvements of navy-yards.....	16,021,079	69
For interest on the public debt.....	51,862,256	47
For the District of Columbia.....	8,493,650	95
For miscellaneous expenditures, including public buildings, light-houses, and collecting the revenue.....	54,728,056	21

The amount paid on the public debt during the fiscal year ended June 30, 1885, was \$45,993,235.43; and there has been paid since that date and up to November 1, 1885, the sum of \$369,823, leaving the amount of the debt at the last-named date \$1,514,475,860.47. There was, however, at that time in the Treasury, applicable to the general purposes of the Government, the sum of \$66,818,292.38.

The total receipts for the current fiscal year, ending June 30, 1886, ascertained to October 1, 1885, and estimated for the remainder of the year, are \$315,000,000. The expenditures ascertained and estimated for the same time are \$245,000,000, leaving a surplus at the close of the year estimated at \$70,000,000.

The value of the exports from the United States to foreign countries during the last fiscal year was as follows:

Domestic merchandise.....	\$726,682,946	
Foreign merchandise.....	15,506,809	
 Total.....	 \$742,189,755	
Gold.....	8,477,892	
Silver.....	32,753,633	
 Total.....	 \$784,421,280	

Some of the principal exports, with their values and the percentage they respectively bear to the total exportation, are given as follow:

ARTICLES.	Value.	Percent- age.
Cotton and cotton manufactures.....	\$213,799,049	29.42
Breadstuffs.....	160,370,521	22.07
Provisions.....	107,332,456	14.77
Oils—mineral, vegetable, and animal.....	54,326,202	7.48
Tobacco and its manufactures.....	24,151,305	3.41
Wool and its manufactures.....	21,464,322	2.95

Our imports during the year were as follow:

Merchandise.....	\$579,580,053	80
Gold.....	26,691,696	00
Silver.....	16,550,627	00
 Total.....	 \$622,822,376	80

The following are given as prominent articles of imports during the year, with their values and the percentage they bear to the total importation:

ARTICLES.	Value.	Percent- age.
Sugar and molasses.....	\$76,738,718	13.29
Coffee.....	46,723,818	8.09
Wool and its manufactures.....	44,656,482	7.73
Silk and its manufactures.....	40,393,002	6.99
Chemicals, dyes, drugs, and medicines.....	35,070,516	6.07
Iron and steel and their manufactures.....	34,563,659	5.93
Flax, hemp, jute, and their manufactures.....	32,854,574	5.69
Cotton and its manufactures.....	28,152,001	4.88
Hides and skins other than fur-skins.....	20,586,443	3.56

Of the entire amount of duties collected 70 per cent. was collected from the following articles of import:

ARTICLES.	Value.	Percent- age.
Sugar and molasses.....	\$76,738,718	13.29
Wool and its manufactures.....	46,723,818	8.09
Silk and its manufactures.....	44,656,482	7.73
Iron and steel and their manufactures.....	40,393,002	6.99
Cotton manufactures.....	35,070,516	6.07
Flax, hemp, and jute, and their manufactures.....	32,854,574	5.69

The fact that our revenues are in excess of the actual needs of an economical administration of the Government justifies a reduction in the amount exacted from the people for its support. Our Government is but the means established by the will of a free people, by which certain principles are applied which they have adopted for their benefit and protection; and it is never better administered and its true spirit is never better observed than when the people's taxation for its support is scrupulously limited to the actual necessity of expenditure, and distributed according to a just and equitable plan.

The proposition with which we have to deal is the reduction of the revenue received by the Government, and indirectly paid by the people from customs duties. The question of free trade is not involved, nor is there now any occasion for the general discussion of the wisdom or expediency of a protective system.

Justice and fairness dictate that in any modification of our present laws relating to revenue the industries and interests which have been encouraged by such laws, and in which our citizens have large investments, should not be ruthlessly injured or destroyed. We should also deal with the subject in such manner as to protect the interests of American labor, which is the capital of our working-men; its stability and proper remuneration furnish the most justifiable pretext for a protective policy.

Within these limitations a certain reduction should be made in our customs revenue. The amount of such reduction having been determined, the inquiry follows, Where can it best be remitted and what articles can best be released from duty, in the interest of our citizens?

I think the reduction should be made in the revenue derived from a tax upon the imported necessities of life. We thus directly lessen the cost of living in every family of the land, and release to the people in every humble home a larger measure of the rewards of frugal industry.

During the year ended Nov. 1, 1885, 145 national banks were organized, with an aggregate capital of \$16,938,000, and circulating notes have been issued to them amounting to \$4,274,910. The whole number of these banks in existence on the day above mentioned was 2,727.

The very limited amount of circulating notes issued by our national banks compared with the amount the law permits them to issue, upon a deposit of bonds for their redemption, indicates that the volume of our circulating medium may be largely increased through this instrumentalities.

Nothing more important than the present condition of our currency and coinage can claim your attention.

Since February, 1878, the Government has, under the compulsory provisions of law, purchased silver bullion and coined the same at the rate of more than \$2,000,000 every month. By this process up to the present date 215,759,481 silver dollars have been coined.

A reasonable appreciation of a delegation of power to the General Government would limit its exercise without express restrictive words to the people's needs and the requirements of the public welfare.

Upon this theory, the authority to "coin money" given to Congress by the Constitution, if it permits the purchase by the Government of bullion for coinage in any event, does not justify such purchase and coinage to an extent beyond the amount needed for a sufficient circulating medium.

The desire to utilize the silver product of the country should not lead to a misuse or the perversion of this power.

The necessity for such an addition to the silver currency of the nation as is compelled by the silver-coinage act is negatived by the fact that up to the present time only about fifty millions of the silver dollars so coined have actually found their way into circulation, leaving more than one hundred and sixty-five millions in the possession of the Government, the custody of which has entailed a considerable expense for the

construction of vaults for its deposit. Against this latter amount there are outstanding silver certificates amounting to about \$93,000,000.

Every month two millions of gold in the public Treasury are paid out for two millions or more of silver dollars, to be added to the idle mass already accumulated.

If continued long enough, this operation will result in the substitution of silver for all the gold the Government owns applicable to its general purposes. It will not do to rely upon the customs receipts of the Government to make good this drain of gold, because the silver thus coined having been made legal tender for all debts and dues, public and private, at times during the last six months 55 per cent. of the receipts for duties have been in silver or silver certificates, while the average within that period has been 20 per cent. The proportion of silver and its certificates received by the Government will probably increase as time goes on, for the reason that the nearer the period approaches when it will be obliged to offer silver in payment of its obligations, the greater inducement there will be to hoard gold against depreciation in the value of silver, or for the purpose of speculating.

This hoarding of gold has already begun.

When the time comes that gold has been withdrawn from circulation, then will be apparent the difference between the real value of the silver dollar and a dollar in gold, and the two coins will part company. Gold, still the standard of value, and necessary in our dealings with other countries, will be at a premium over silver; banks which have substituted gold for the deposits of their customers may pay them with silver bought with such gold, thus making a handsome profit; rich speculators will sell their hoarded gold to their neighbors, who need it to liquidate their foreign debts, at a ruinous premium over silver, and the laboring men and women of the land, most defenseless of all, will find that the dollar received for the wage of their toil has sadly shrunk in its purchasing power. It may be said that the latter result will be but temporary, and that ultimately the price of labor will be adjusted to the change; but even if this takes place the wage-worker can not possibly gain, but must inevitably lose, since the price he is compelled to pay for his living will not only be measured in a coin heavily depreciated, and fluctuating and uncertain in its value, but this uncertainty in the value of the purchasing medium will be made the pretext for an advance in prices beyond that justified by actual depreciation.

The words uttered in 1834 by Daniel Webster in the Senate of the United States are true to-day: "The very man of all others who has the deepest interest in a sound currency, and who suffers most by mischievous legislation in money matters, is the man who earns his daily bread by his daily toil."

The most distinguished advocate of bimetallism, discussing our silver coinage, has lately written: "No American citizen's hand has yet felt the sensation of cheapness, either in receiving or expending the silver-act dollars."

And those who live by labor or legitimate trade never will feel that sensation of cheapness. However plenty silver dollars may become, they will not be distributed as gifts among the people; and if the laboring-man should receive four depreciated dollars where he now receives but two, he will pay in the depreciated coin more than double the price he now pays for all the necessities and comforts of life.

Those who do not fear any disastrous consequences arising from the continued compulsory coinage of silver as now directed by law, and who suppose that the addition to the currency of the country intended as its result will be a public benefit, are reminded that history demonstrates that the point is easily reached in the attempt to float at the same time two sorts of money of different excellence, when the better will cease to be in general circulation. The hoarding of gold, which has already taken place, indicates that

we shall not escape the usual experience in such cases. So if this silver coinage be continued we may reasonably expect that gold and its equivalent will abandon the field of circulation to silver alone. This, of course, must produce a severe contraction of our circulating medium, instead of adding to it.

It will not be disputed that any attempt on the part of the Government to cause the circulation of silver dollars worth eighty cents, side by side with gold dollars worth one hundred cents, even within the limit that legislation does not run counter to the laws of trade, to be successful must be seconded by the confidence of the people that both coins will retain the same purchasing power and be interchangeable at will. A special effort has been made by the Secretary of the Treasury to increase the amount of our silver coin in circulation; but the fact that a large share of the limited amount thus put out has soon returned to the public Treasury in payment of duties, leads to the belief that the people do not now desire to keep it in hand; and this, with the evident disposition to hoard gold, gives rise to the suspicion that there already exists a lack of confidence among the people touching our financial processes. There is certainly not enough silver now in circulation to cause uneasiness, and the whole amount coined and now on hand might after a time be absorbed by the people without apprehension; but it is the ceaseless stream that threatens to overflow the land which causes fear and uncertainty.

What has been thus far submitted upon this subject relates almost entirely to considerations of a home nature, unconnected with the bearing which the policies of other nations have upon the question. But it is perfectly apparent that a line of action in regard to our currency can not wisely be settled upon or persisted in without considering the attitude on the subject of other countries with whom we maintain intercourse through commerce, trade, and travel. An acknowledgement of this fact is found in the act by virtue of which our silver is compulsorily coined. It provides that "the President shall invite the governments of the countries composing the Latin Union, so called, and of such other European nations as he may deem advisable, to join the United States in a conference to adopt a common ratio between gold and silver for the purpose of establishing internationally the use of bimetallic money and securing fixity of relative value between these metals."

This conference absolutely failed, and a similar fate has awaited all subsequent efforts in the same direction. And still we continue our coinage of silver at a ratio different from that of any other nation. The most vital part of the silver-coining act remains inoperative and unexecuted, and, without an ally or friend, we battle upon the silver field in an illogical and losing contest.

To give full effect to the design of Congress on this subject I have made careful and earnest endeavor since the adjournment of the last Congress.

To this end I delegated a gentleman well instructed in fiscal science to proceed to the financial centers of Europe, and, in conjunction with our ministers to England, France, and Germany, to obtain a full knowledge of the attitude and intent of those governments in respect of the establishment of such an international ratio as would procure free coinage of both metals at the mints of those countries and our own. By my direction our consul-general at Paris has given close attention to the proceedings of the congress of the Latin Union, in order to indicate our interest in its objects and report its action.

It may be said, in brief, as the result of these efforts, that the attitude of the leading powers remains substantially unchanged since the monetary conference of 1881, nor is it to be questioned that the views of these governments are in each instance supported by the weight of public opinion.

The steps thus taken have therefore only more fully demonstrated the uselessness of further attempts

at present to arrive at any agreement on the subject with other nations.

In the mean time we are accumulating silver coin, based upon our own peculiar ratio, to such an extent, and assuming so heavy a burden to be provided for in any international negotiations, as will render us an undesirable party to any future monetary conference of nations.

It is a significant fact that four of the five countries composing the Latin Union mentioned in our coinage act, embarrassed with their silver currency, have just completed an agreement among themselves that no more silver shall be coined by their respective governments, and that such as has been already coined and in circulation shall be redeemed in gold by the country of its coinage. The resort to this expedient by these countries may well arrest the attention of those who suppose that we can succeed without shock or injury in the attempt to circulate upon its merits all the silver we may coin under the provisions of our silver-coinage act.

The condition in which our treasury may be placed by a persistence in our present course is a matter of concern to every patriotic citizen who does not desire his Government to pay in silver such of its obligations as should be paid in gold. Nor should our condition be such as to oblige us, in a prudent management of our affairs, to discontinue the calling in and payment of interest-bearing obligations which we have the right now to discharge, and thus avoid the payment of further interest thereon.

The so-called debtor class, for whose benefit the continued compulsory coinage of silver is insisted upon, are not dishonest because they are in debt; and they should not be suspected of a desire to jeopardize the financial safety of the country in order that they may cancel their present debts by paying the same in depreciated dollars. Nor should it be forgotten that it is not the rich nor the money-lender alone that must submit to such a readjustment, enforced by the Government and their debtors. The pittance of the widow and the orphan, and the incomes of helpless beneficiaries of all kinds, would be disastrously reduced. The depositors in savings-banks and in other institutions which hold in trust the savings of the poor, when their little accumulations are scaled down to meet the new order of things, would, in their distress, painfully realize the delusion of the promise made to them that plentiful money would improve their condition.

We have now on hand all the silver dollars necessary to supply the present needs of the people, and to satisfy those who, from sentiment, wish to see them in circulation; and if their coinage is suspended they can be readily obtained by all who desire them. If the need of more is at any time apparent, their coinage may be renewed.

That disaster has not already overtaken us furnishes no proof that danger does not wait upon a continuation of the present silver coinage. We have been saved by the most careful management and unusual expedients, by a combination of fortunate conditions, and by a confident expectation that the course of the Government in regard to silver coinage would be speedily changed by the action of Congress.

Prosperity hesitates upon our threshold because of the dangers and uncertainties surrounding this question. Capital timidly shrinks from trade, and investors are unwilling to take the chance of the questionable shape in which their money will be returned to them, while enterprise halts at a risk against which care and sagacious management do not protect.

As a necessary consequence, labor lacks employment, and suffering and distress are visited upon a portion of our fellow-citizens especially entitled to the careful consideration of those charged with the duties of legislation. No interest appeals to us so strongly for a safe and stable currency as the vast army of the unemployed.

I recommend the suspension of the compulsory coin-

age of silver dollars, directed by the law passed in February, 1878.

The steamboat-inspection service, on the 30th day of June, 1885, was composed of one hundred and forty persons, including officers, clerks, and messengers. The expenses of the service over the receipts were \$183,822.22 during the fiscal year. The special inspection of foreign steam-vessels, organized under a law passed in 1882, was maintained during the year at an expense of \$36,641.63. Since the close of the fiscal year reductions have been made in the force employed which will result in a saving during the current year of \$17,000 without affecting the efficiency of the service.

The Supervising Surgeon-General reports that during the fiscal year 41,714 patients have received relief through the Marine-Hospital Service, of whom 12,803 were treated in hospitals and 28,911 at the dispensaries.

Active and effective efforts have been made, through the medium of this service, to protect the country against an invasion of cholera, which has prevailed in Spain and France, and the small-pox, which recently broke out in Canada.

The most gratifying results have attended the operations of the Life-Saving Service during the last fiscal year. The observance of the provision of law requiring the appointment of the force employed in this service to be made "solely with reference to their fitness, and without reference to their political or party affiliation," has secured the result which may confidently be expected in any branch of public employment where such a rule is applied. As a consequence, this service is composed of men well qualified for the performance of their dangerous and exceptionally important duties.

The number of stations in commission at the close of the year was 203. The number of disasters to vessels and craft of all kinds within their field of action was 371. The number of persons endangered in such disasters was 2,439, of whom 2,428 were saved and only 11 lost. Other lives which were imperiled, though not by disasters to shipping, were also rescued, and a large amount of property was saved through the aid of this service. The cost of its maintenance during the year was \$828,474.43.

The work of the Coast and Geodetic Survey was, during the last fiscal year, carried on within the boundaries and off the coasts of thirty-two States, two Territories, and the District of Columbia. In July last certain irregularities were found to exist in the management of this bureau, which led to a prompt investigation of its methods. The abuses which were brought to light by this examination, and the reckless disregard of duty and the interests of the Government developed on the part of some of those connected with the service, made a change of superintendency and a few of its other officers necessary. Since the bureau has been in new hands an introduction of economies and the application of business methods have produced an important saving to the Government and a promise of more useful results.

This service has never been regulated by anything but the most indefinite legal enactments and the most unsatisfactory rules. It was many years ago sanctioned apparently for a purpose regarded as temporary, and related to a survey of our coast. Having gained a place in the appropriations made by Congress, it has gradually taken to itself powers and objects not contemplated in its creation, and extended its operations, until it sadly needs legislative attention.

So far as a further survey of our coast is concerned, there seems to be a propriety in transferring that work to the Navy Department. The other duties now in charge of this establishment, if they can not be profitably attached to some existing department or other bureau, should be prosecuted under a law exactly defining their scope and purpose, and with a careful discrimination between the scientific inquiries which may properly be assumed by the Government and those

which should be undertaken by State authority or by individual enterprise.

It is hoped that the report of the congressional committee heretofore appointed to investigate this and other like matters, will aid in the accomplishment of proper legislation on this subject.

The report of the Secretary of War is herewith submitted. The attention of Congress is invited to the detailed account which it contains of the administration of his department, and his recommendations and suggestions for the improvement of the service.

The Army consisted, at the date of the last consolidated returns, of 2,154 officers and 24,705 enlisted men.

The expenses of the departments for the fiscal year ended June 30, 1835, including \$13,164,394.60 for public works and river and harbor improvements, were \$45,850,999.54.

Besides the troops which were dispatched in pursuit of the small band of Indians who left their reservation in Arizona and committed murders and outrages, two regiments of cavalry and one of infantry were sent last July to the Indian Territory to prevent an outbreak which seemed imminent. They remained to aid if necessary in the expulsion of intruders upon the reservation, who seemed to have caused the discontent among the Indians, but the Executive proclamation warning them to remove was complied with without their interference.

Troops were also sent to Rock Springs in Wyoming Territory, after the massacre of Chinese there to prevent further disturbance, and afterward to Seattle, in Washington Territory, to avert a threatened attack upon Chinese laborers and domestic violence there. In both cases, the mere presence of the troops had the desired effect.

It appears that the number of desertions have diminished, but that during the last fiscal year they numbered 2,927; and one instance is given by the Lieutenant-General of six desertions by the same recruit. I am convinced that this number of desertions can be much diminished by better discipline and treatment; but the punishment should be increased for repeated offenses.

These desertions might also be reduced by lessening the term of first enlistments, thus allowing a discontented recruit to contemplate a nearer discharge, and the Army a profitable riddance. After one term of service a re-enlistment would be quite apt to secure a contented recruit and a good soldier.

The Acting Judge-Advocate-General reports that the number of trials by general courts-martial during the year was 2,328, and that 11,851 trials took place before garrison and regimental courts-martial. The suggestion that probably more than half the Army have been tried for offenses great and small, in one year, may well arrest attention. Of course, many of these trials before garrison and regimental courts-martial were for offenses almost frivolous; and there should, I think, be a way devised to dispose of these in a more summary and less inconvenient manner than by court-martial.

If some of the proceedings of courts-martial which I have had occasion to examine present the ideas of justice which generally prevail in these tribunals, I am satisfied that they should be much reformed, if the honor and honesty of the Army and Navy are by their instrumentality to be vindicated and protected.

The board on fortifications or other defenses, appointed in pursuance of the provisions of the act of Congress approved March 3, 1835, will in a short time present their report; and it is hoped that this may greatly aid the legislation so necessary to remedy the present defenseless condition of our sea-coasts.

The work of the Signal Service has been prosecuted during the last year, with results of increasing benefit to the country. The field of instruction has been enlarged with a view of adding to its usefulness. The number of stations in operation June 30, 1835, was 489. Telegraphic reports are received daily from

160 stations. Reports are also received from 25 Canadian stations, 375 volunteer observers, 52 army-surgeons at military posts, and 333 foreign stations. The expense of the service during the fiscal year after deducting receipts from military telegraph lines was \$792,592.97. In view of the fact referred to by the Secretary of War, that the work of this service ordinarily is of a scientific nature, and the further fact that it is assuming larger proportions constantly, and becoming more and more unsuited to the fixed rules which must govern the Army, I am inclined to agree with him in the opinion that it should be separately established. If this is done, the scope and extent of its operations should, as nearly as possible, be definitely prescribed by law, and always capable of exact ascertainment.

The Military Academy at West Point is reported as being in a high state of efficiency, and well equipped for the satisfactory accomplishment of the purposes of its maintenance.

The fact that the class which graduates next year is an unusually large one, has constrained me to decline to make appointments to second-lieutenancies in the Army from civil life, so that such vacancies as exist in these places may be reserved for such graduates; and yet it is not probable that there will be enough vacancies to provide positions for them all when they leave the military school. Under the prevailing law and usage those not thus assigned to duty never actively enter the military service. It is suggested that the law on this subject be changed, so that such of these young men as are not at once assigned to duty after graduation may be retained as second-lieutenants in the Army if they desire it, subject to assignment when opportunity occurs, and under proper rules as to priority of selection.

The expenditures on account of the Military Academy for the last fiscal year, exclusive of the sum taken for its purposes from appropriations for the support of the Army, were \$290,712.07.

The act approved March 3, 1835, designed to compensate officers and enlisted men for loss of private property while in the service of the United States, is so indefinite in its terms, and apparently admits so many claims the adjustment of which could not have been contemplated, that if it is to remain upon the statute-book it needs amendment.

There should be a general law of Congress prohibiting the construction of bridges over navigable waters in such manner as to obstruct navigation, with provisions for preventing the same. It seems that under existing statutes the Government can not intervene to prevent such a construction when entered upon without its consent, though when such consent is asked and granted upon condition, the authority to insist upon such condition is clear. Thus it is represented that while the officers of the Government are with great care guarding against the obstruction of navigation by a bridge across the Mississippi River at Saint Paul, a large pier for a bridge has been built just below this place directly in the navigable channel of the river. If such things are to be permitted, a strong argument is presented against the appropriation of large sums of money to improve the navigation of this and other important highways of commerce.

The report of the Secretary of the Navy gives a history of the operations of his department and the present condition of the work committed to his charge.

He details in full the course pursued by him to protect the rights of the Government in respect of certain vessels unfinished at the time of his accession to office, and also concerning the dispatch-boat *Dolphin*, claimed to be completed and awaiting the acceptance of the department. No one can fail to see, from recitals contained in this report, that only the application of business principles has been insisted upon in the treatment of these subjects, and that whatever controversy has arisen was caused by the exaction on the part of the department of contract obligations as

they were legally construed. In the case of the Dolphine, with entire justice to the contractor, an agreement has been entered into providing for the ascertainment by a judicial inquiry of the complete or partial compliance with the contract in her construction, and further providing for the assessment of any damages to which the Government may be entitled on account of a partial failure to perform such contract, or the payment of the sum still remaining unpaid upon her price, in case a full performance is adjudged.

The contractor, by reason of his failure in business, being unable to complete the other three vessels, they were taken possession of by the Government in their unfinished state, under a clause in the contract permitting such a course, and are now in process of completion in the yard of the contractor, but under the supervision of the Navy Department.

Congress at its last session authorized the construction of two additional new cruisers and two gunboats, at a cost not exceeding in the aggregate \$2,995,000. The appropriation for this purpose having become available on the 1st day of July last, steps were at once taken for the procurement of such plans for the construction of these vessels as would be likely to insure their usefulness when completed. These are of the utmost importance, considering the constant advance in the art of building vessels of this character, and the time is not lost which is spent in their careful consideration and selection.

All must admit the importance of an effective navy to a nation like ours, having such an extended sea-coast to protect. And yet we have not a single vessel of war that could keep the seas against a first-class vessel of any important power. Such a condition ought not longer to continue. The nation that can not resist aggression is constantly exposed to it. Its foreign policy is of necessity weak, and its negotiations are conducted with disadvantage, because it is not in condition to enforce the terms dictated by its sense of right and justice.

Inspired, as I am, by the hope, shared by all patriotic citizens, that the day is not very far distant when our navy will be such as befits our standing among the nations of the earth, and rejoiced at every step that leads in the direction of such a consummation, I deem it my duty to especially direct the attention of Congress to the close of the report of the Secretary of the Navy, in which the humiliating weakness of the present organization of his department is exhibited, and the startling abuses and waste of its present methods are exposed. The conviction is forced upon us, with the certainty of mathematical demonstration, that before we proceed further in the restoration of a navy we need a thoroughly reorganized Navy Department. The fact that within seventeen years more than \$75,000,000 have been spent in the construction, repair, equipment, and armament of vessels, and the further fact that, instead of an effective and creditable fleet, we have only the discontent and apprehension of a nation undefended by war-vessels, added to the disclosures now made, do not permit us to doubt that every attempt to revive our navy has thus far, for the most part, been misdirected, and all our efforts in that direction have been little better than blind gropings and expensive, aimless follies.

Unquestionably, if we are content with the maintenance of a Navy Department simply as a shabby ornament to the Government, a constant watchfulness may prevent some of the scandal and abuse which have found their way into our present organization, and its incurable waste may be reduced to a minimum. But if we desire to build ships for present usefulness, instead of naval reminders of the days that are past, we must have a department organized for the work, supplied with all the talent and ingenuity our country affords, prepared to take advantage of the experience of other nations; systematized so that all effort shall unite and lead in one direction, and fully imbued with the conviction that war-ves-

sels, though new, are useless unless they combine all that the ingenuity of man has up to this day brought forth relating to their construction.

I earnestly commend the portion of the Secretary's report devoted to this subject to the attention of Congress, in the hope that his suggestions touching the reorganization of his department may be adopted as the first step toward the reconstruction of our navy.

The affairs of the postal service are exhibited by the report of the Postmaster-General, which will be laid before you.

The postal revenue, whose ratio of gain upon the rising prosperity of 1882 and 1883 outstripped the increasing expenses of our growing service, was checked by the reduction in the rate of letter-postage, which took effect with the beginning of October in the latter year; and it diminished during the two past fiscal years \$2,790,000, in about the proportion of \$2,270,000 in 1884 to \$520,000 in 1885. Natural growth and development have meantime increased expenditure, resulting in a deficiency in the revenue to meet the expenses of the department of five and a quarter million dollars for the year 1884, and eight and a third million in the last fiscal year. The anticipated and natural revival of the revenue has been oppressed and retarded by the unfavorable business condition of the country, of which the postal service is a faithful indicator. The gratifying fact is shown, however, by the report, that our returning prosperity is marked by a gain of \$380,000 in the revenue of the latter half of the last year over the corresponding period of the preceding year.

The change in the weight of first-class matter which may be carried for a single rate of postage, from a half-ounce to an ounce, and the reduction by one half of the rate of newspaper-postage, which, under recent legislation, began with the present year, will operate to restrain the augmentation of receipts which otherwise might have been expected, to such a degree that the scale of expense may gain upon the revenue and cause an increased deficiency to be shown at its close. Yet, after no long period of reawakened prosperity, by proper economy, it is confidently anticipated that even the present low rates, now as favorable as any country affords, will be adequate to sustain the cost of the service.

The operation of the Post-Office Department is for the convenience and benefit of the people; and the method by which they pay the charges of this useful arm of their public service, so that it be just and impartial, is of less importance to them than the economical expenditure of the means they provide for its maintenance and the due improvement of its agencies, so that they may enjoy its highest usefulness.

A proper attention has been directed to the prevention of waste or extravagance, and good results appear from the report to have already been accomplished.

I approve the recommendation of the Postmaster-General to reduce the charges on domestic money-orders of five dollars and less from eight to five cents. This change will materially aid those of our people who most of all avail themselves of this instrumentality, but to whom the element of cheapness is of the greatest importance. With this reduction the system would still remain self-supporting.

The free-delivery system has been extended to nineteen additional cities during the year, and one hundred and seventy-eight now enjoy its conveniences. Experience has commended it to those who enjoy its benefits, and further enlargement of its facilities is due to other communities to which it is adapted. In the cities where it has been established, taken together, the local postage exceeds its maintenance by nearly \$1,300,000. The limit to which this system is now confined by law has been nearly reached, and the reasons given justify its extension, which is proposed.

It was decided, with my approbation, after a sufficient examination, to be inexpedient for the Post-

Office Department to contract for carrying our foreign mails under the additional authority given by the last Congress. The amount limited was inadequate to pay all within the purview of the law the full rate of fifty cents per mile, and it would have been unjust and unwise to have given it to some and denied it to others. Nor could contracts have been let under the law to all at a rate to have brought the aggregate within the appropriation, without such practical pre-arrangement of terms as would have violated it.

The rate of sea and inland postage, which was professed under another statute, clearly appears to be a fair compensation for the desired service, being three times the price necessary to secure transportation by other vessels upon any route, and much beyond the charges made to private persons for services not less burdensome.

Some of the steamship companies, upon the refusal of the Postmaster-General to attempt, by the means provided, the distribution of the sum appropriated as an extra compensation, withdrew the services of their vessels and thereby occasioned slight inconvenience, though no considerable injury, the mails having been dispatched by other means.

Whatever may be thought of the policy of subsidizing any line of public conveyance or travel, I am satisfied that it should not be done under cover of an expenditure incident to the administration of a department, nor should there be any uncertainty as to the recipients of the subsidy, or any discretion left to an executive officer as to its distribution. If such gifts of the public money are to be made for the purpose of aiding any enterprise, in the supposed interest of the public, I can not but think that the amount to be paid, and the beneficiary, might better be determined by Congress than in any other way.

The international congress of delegates from the Postal-Union countries convened at Lisbon, in Portugal, in February last, and after a session of some weeks the delegates signed a convention amendatory of the present Postal-Union Convention in some particulars designed to advance its purposes. This additional act has had my approval, and will be laid before you with the departmental report.

I approve the recommendation of the Postmaster-General that another assistant be provided for his department. I invite your consideration to the several other recommendations contained in his report.

The report of the Attorney-General contains a history of the conduct of the Department of Justice during the last year, and a number of valuable suggestions as to needed legislation; and I invite your careful attention to the same.

The condition of business in the courts of the United States is such that there seems to be an imperative necessity for remedial legislation on the subject. Some of these courts are so overburdened with pending causes that the delays in determining litigation amount often to a denial of justice. Among the plans suggested for relief is one submitted by the Attorney-General. Its main features are: The transfer of all the original jurisdiction of the circuit courts to the district courts, and an increase of judges for the latter where necessary; an addition of judges to the circuit courts, and constituting them exclusively courts of appeal, and reasonably limiting appeals thereto; further restrictions of the right to remove causes from the State to Federal courts; permitting appeals to the Supreme Court from the courts of the District of Columbia and the Territories only in the same cases as they are allowed from State courts, and guarding against an unnecessary number of appeals from the circuit courts.

I approve the plan thus outlined, and recommend the legislation necessary for its application to our judicial system.

The present mode of compensating United States marshals and district attorneys should, in my opinion, be changed. They are allowed to charge against the Government certain fees for services, their income

being measured by the amount of such fees within a fixed limit as to their annual aggregate. This is a direct inducement for them to make their fees in criminal cases as large as possible in an effort to reach the maximum sum permitted. As an entirely natural consequence, unscrupulous marshals are found encouraging frivolous prosecutions, arresting people on petty charges of crime, and transporting them to distant places for examination and trial, for the purpose of earning mileage and other fees; and district attorneys uselessly attend criminal examinations far from their places of residence, for the express purpose of swelling their accounts against the Government. The actual expenses incurred in these transactions are also charged against the Government.

Thus the rights and freedom of our citizens are outraged, and public expenditures increased, for the purpose of furnishing public officers pretexts for increasing the measure of their compensation.

I think marshals and district attorneys should be paid salaries, adjusted by a rule which will make them commensurate with services fairly rendered.

In connection with this subject I desire to suggest the advisability, if it be found not obnoxious to constitutional objection, of investing United States commissioners with the power to try and determine certain violations of law within the grade of misdemeanors. Such trials might be made to depend upon the option of the accused. The multiplication of small and technical offenses, especially under the provisions of our internal-revenue law, render some change in our present system very desirable, in the interests of humanity as well as economy.

The district courts are now crowded with petty prosecutions, involving a punishment, in cases of conviction, of only a slight fine, while the parties accused are harassed by an enforced attendance upon courts held hundreds of miles from their homes. If poor and friendless they are obliged to remain in jail during months, perhaps, that elapse before a session of the court is held, and are finally brought to trial surrounded by strangers and with but little real opportunity for defense. In the mean time frequently the marshal has charged against the Government his fees for an arrest, the transportation of the accused and the expense of the same, and for summoning witnesses before a commissioner, a grand jury, and a court; the witnesses have been paid from the public funds large fees and traveling expenses, and the commissioner and district attorney have also made their charges against the Government.

This abuse in the administration of our criminal law should be remedied; and if the plan above suggested is not practicable, some other should be devised.

The report of the Secretary of the Interior, containing an account of the operations of this important department and much interesting information, will be submitted for your consideration.

The most intricate and difficult subject in charge of this department is the treatment and management of the Indians. I am satisfied that some progress may be noted in their condition as a result of a prudent administration of the present laws and regulations for their control.

But it is submitted that there is lack of a fixed purpose or policy on this subject, which should be supplied. It is useless to dilate upon the wrongs of the Indians, and as useless to indulge in the heartless belief that because their wrongs are revenged in their own atrocious manner therefore they should be exterminated.

They are within the care of our Government, and their rights are, or should be, protected from invasion by the most solemn obligations. They are properly enough called the wards of the Government; and it should be borne in mind that this guardianship involves, on our part, efforts for the improvement of their condition and the enforcement of their rights. There seems to be general concurrence in the proposition that the ultimate object of their treatment

should be their civilization and citizenship. Fitted by these to keep pace in the march of progress with the advanced civilization about them, they will readily assimilate with the mass of our population, assuming the responsibilities and receiving the protection incident to this condition.

The difficulty appears to be in the selection of the means to be at present employed toward the attainment of this result.

Our Indian population, exclusive of those in Alaska, is reported as numbering 280,000, nearly all being located on lands set apart for their use and occupation, aggregating over 134,000,000 acres. These lands are included in the boundaries of one hundred and seventy-one reservations of different dimensions scattered in twenty-one States and Territories, presenting great variations in climate and in the kind and quality of their soils. Among the Indians upon these several reservations there exists the most marked differences in natural traits and disposition and in their progress toward civilization. While some are lazy, vicious, and stupid, others are industrious, peaceful, and intelligent; while a portion of them are self-supporting and independent, and have so far advanced in civilization that they make their own laws, administered through officers of their own choice, and educate their children in schools of their own establishment and maintenance, others still retain, in squalor and dependence, almost the savagery of their natural state.

In dealing with this question, the desires manifested by the Indians should not be ignored. Here, again, we find a great diversity. With some the tribal relation is cherished with the utmost tenacity, while its hold upon others is considerably relaxed; the love of home is strong with all, and yet there are those whose attachment to a particular locality is by no means unyielding; the ownership of their lands in severity is much desired by some, while by others, and sometimes among the most civilized, such a distribution would be bitterly opposed.

The variation of their wants, growing out of and connected with the character of their several locations, should be regarded. Some are upon reservations most fit for grazing, but without flocks or herds; and some, on arable land, have no agricultural implements. While some of the reservations are double the size necessary to maintain the number of Indians now upon them, in a few cases, perhaps, they should be enlarged.

Add to all this the difference in the administration of the agencies. While the same duties are devolved upon all, the disposition of the agents and the manner of their contact with the Indians have much to do with their condition and welfare. The agent who perfunctorily performs his duty and slothfully neglects all opportunity to advance their moral and physical improvement, and fails to inspire them with a desire for better things, will accomplish nothing in the direction of their civilization; while he who feels the burden of an important trust, and has an interest in his work, will, by consistent example, firm yet considerate treatment, and well-directed aid and encouragement, constantly lead those under his charge toward the light of their enfranchisement.

The history of all the progress which has been made in the civilization of the Indian I think will disclose the fact that the beginning has been religious teaching, followed by or accompanying secular education. While the self-sacrificing and pious men and women who have aided in this good work by their independent endeavor have for their reward the beneficent results of their labor and consciousness of Christian duty well performed, their valuable services should be fully acknowledged by all who, under the law, are charged with the control and management of our Indian wards.

What has been said indicates that, in the present condition of the Indians, no attempt should be made to apply a fixed and unyielding plan of action to their varied and varying needs and circumstances.

The Indian Bureau, burdened as it is with their general oversight and with the details of the establishment, can hardly possess itself of the minute phases of the particular cases needing treatment; and thus to those already established for the care of the Indians suggests itself.

I recommend the passage of a law authorizing the appointment of six commissioners, three of whom shall be detailed from the Army, to be charged with the duty of a careful inspection, from time to time, of all the Indians upon our reservations or subject to the care and control of the Government, with a view of discovering their exact condition and needs, and determining what steps shall be taken on behalf of the Government to improve their situation in the direction of their self-support and complete civilization; that they may ascertain from such inspection what, if any, of the reservations may be reduced in area, and in such cases what part not needed for Indian occupation may be purchased by the Government from the Indians and disposed of for their benefit; what, if any, Indians may with their consent be removed to other reservations, with a view of their concentration and the sale on their behalf of their abandoned reservations; what Indian lands now held in common should be allotted in severality; in what manner and to what extent the Indians upon the reservations can be placed under the protection of our laws and subjected to their penalties; and which, if any, Indians should be invested with the rights of citizenship. The powers and functions of the commissioners in regard to these subjects should be clearly defined, though they should, in conjunction with the Secretary of the Interior, be given all the authority to deal definitely with the questions presented deemed safe and consistent.

They should also be charged with the duty of ascertaining the Indians who might properly be furnished with implements of agriculture, and of what kind; in what cases the support of the Government should be withdrawn; where the present plan of distributing Indian supplies should be changed; where schools may be established and where discontinued; the conduct, methods, and fitness of agents in charge of reservations; the extent to which such reservations are occupied or intruded upon by unauthorized persons; and generally all matters related to the welfare and improvement of the Indian.

They should advise with the Secretary of the Interior concerning these matters of detail in management, and he should be given power to deal with them fully if he is not now invested with such power.

This plan contemplates the selection of persons for commissioners who are interested in the Indian question, and who have practical ideas upon the subject of their treatment.

The expense of the Indian Bureau during the last fiscal year was more than six and a half million dollars. I believe much of this expenditure might be saved under the plan proposed; that its economical effects would be increased with its continuance; that the safety of our frontier settlers would be subserved under its operation; and that the nation would be saved through its results from the imputation of inhumanity, injustice, and mismanagement.

In order to carry out the policy of allotment of Indian lands in severality when deemed expedient, it will be necessary to have surveys completed of the reservations, and I hope that provision will be made for the prosecution of this work.

In May of the present year a small portion of the Chiricahua Apaches on the White Mountain reservation, in Arizona, left the reservation and committed a number of murders and depredations upon settlers in that neighborhood. Though prompt and energetic action was taken by the military, the renegades eluded capture and escaped into Mexico. The formation of the country through which these Indians passed, their thorough acquaintance with the same, the speed of their escape, and the manner in which they scattered

and concealed themselves among the mountains near the scene of their outrages, put our soldiers at a great disadvantage in their efforts to capture them, though the expectation is still entertained that they will be ultimately taken and punished for their crimes.

The threatening and disorderly conduct of the Cheyennes in the Indian Territory early last summer caused considerable alarm and uneasiness. Investigation proved that their threatening attitude was due in a great measure to the occupation of the land of their reservation by immense herds of cattle, which their owners claimed were rightfully there under certain leases made by the Indians. Such occupation appearing upon examination to be unlawful notwithstanding these leases, the intruders were ordered to remove with their cattle from the lands of the Indians by Executive proclamation. The enforcement of this proclamation had the effect of restoring peace and order among the Indians, and they are now quiet and well behaved.

By an Executive order issued on February 27, 1885, by my predecessor, a portion of the tract of country in the territory known as the Old Winnebago and Crow Creek reservations was directed to be restored to the public domain and opened to settlement under the land-laws of the United States, and a large number of persons entered upon those lands. This action alarmed the Sioux Indians, who claimed the territory as belonging to their reservation under the treaty of 1868. This claim was determined, after careful investigation to be well founded; and consequently the Executive order referred to was, by proclamation of April 17, 1885, declared to be inoperative and of no effect, and all persons upon the land were warned to leave. This warning has been substantially complied with.

The public domain had its origin in cessions of land by the States to the General Government. The first cession was made by the State of New York, and the largest, which in area exceeded all the others, by the State of Virginia. The territory, the proprietorship of which became thus vested in the General Government, extended from the western line of Pennsylvania to the Mississippi river. These patriotic donations of the States were encumbered with no condition, except that they should be held and used "for the common benefit of the United States." By purchase, with the common fund of all the people, additions were made to this domain until it extended to the northern line of Mexico, the Pacific Ocean, and the Polar Sea. The original trust, "for the common benefit of the United States," attached to all. In the execution of that trust the policy of many homes, rather than large estates, was adopted by the Government. That these might be easily obtained, and be the abode of security and contentment, the laws for their acquisition were few, easily understood, and general in their character. But the pressure of local interests, combined with a speculative spirit, have in many instances procured the passage of laws which marred the harmony of the general plan and encumbered the system with a multitude of general and special enactments, which render the land laws complicated, subject the titles to uncertainty, and the purchasers often to oppression and wrong. Laws which were intended for the "common benefit" have been perverted so that large quantities of land are vesting in single ownerships. From the multitude and character of the laws this consequence seems incapable of correction by mere administration.

It is not for the "common benefit of the United States" that a large area of the public lands should be acquired, directly or through fraud, in the hands of a single individual. The nation's strength is in the people. The nation's prosperity is in their prosperity. The nation's glory is in the equality of her justice. The nation's perpetuity is in the patriotism of all her people. Hence, as far as practicable, the plan adopted in the disposal of the public lands should have in view the original policy, which encouraged many purchasers of these lands for homes

and discouraged the massing of large areas. Exclusive of Alaska, about three fifths of the national domain has been sold or subjected to contract or grant. Of the remaining two fifths a considerable portion is either mountain or desert. A rapidly increasing population creates a growing demand for homes, and the accumulation of wealth inspires an eager competition to obtain the public land for speculative purposes. In the future this collision of interests will be more marked than in the past, and the execution of the nation's trust in behalf of our settlers will be more difficult. I therefore recommend to your attention the recommendations contained in the report of the Secretary of the Interior with reference to the repeal and modification of certain of our land-laws.

The nation has made princely grants and subsidies to a system of railroads projected as great national highways to connect the Pacific States with the East. It has been charged that these donations from the people have been diverted to private gain and corrupt uses, and thus public indignation has been aroused and suspicion engendered. Our great nation does not begrudge its generosity, but it abhors peculation and fraud; and the favorable regard of our people for the great corporations to which these grants were made can only be revived by a restoration of confidence, to be secured by their constant, unequivocal, and clearly manifested integrity. A faithful application of the undiminished proceeds of the grants to the construction and perfecting of their roads, an honest discharge of their obligations, and entire justice to all the people in the enjoyment of their rights on these highways of travel, is all the public asks, and it will be content with no less. To secure these things should be the common purpose of the officers of the Government, as well as of the corporations. With this accomplishment, prosperity would be permanently secured to the roads, and national pride would take the place of national complaint.

It appears from the report of the Commissioner of Pensions that there were on the 1st day of July, 1885, 845,128 persons borne upon the pension-rolls, who were classified as follows: Army invalids, 241,456; widows, minor children, and dependent relatives of deceased soldiers, 78,841; Navy invalids, 2,745; Navy widows, minor children, and dependents, 1,926; survivors of the War of 1812, 2,945; and widows of those who served in that war, 17,212. About one man in ten of all those who enlisted in the late war are reported as receiving pensions, exclusive of the dependents of deceased soldiers. On the 1st of July, 1875, the number of pensioners was 234,821, and the increase within the ten years next thereafter was 110,304.

While there is no expenditure of the public funds which the people more cheerfully approve than that made in recognition of the services of our soldiers, living and dead, the sentiment underlying the subject should not be vitiated by the introduction of any fraudulent practices. Therefore it is fully as important that the rolls should be cleansed of all those who by fraud have secured a place thereon as that meritorious claims should be speedily examined and adjusted. The reforms in the methods of doing the business of this bureau which have lately been inaugurated promise better results in both these directions.

The operations of the Patent-Office demonstrate the activity of the inventive genius of the country. For the year ended June 30, 1885, the applications for patents, including reissues, and for the registration of trade-marks and labels, numbered 35,638. During the same period there were 22,928 patents granted and reissued, and 1,429 trade-marks and labels registered. The number of patents issued in the year 1875 was 14,837. The receipts during the last fiscal year were \$1,074,974.35, and the total expenditures, not including contingent expenses, \$934,123.11.

There were 9,788 applications for patents pending on the 1st day of July, 1884, and 5,786 on the same

date in the year 1885. There has been considerable improvement made in the prompt determination of applications and a consequent relief to expectant inventors.

A number of suggestions and recommendations are contained in the report of the Commissioner of Patents which are well entitled to the consideration of Congress.

In the Territory of Utah the law of the United States passed for the suppression of polygamy has been energetically and faithfully executed during the past year, with measurably good results. A number of convictions have been secured for unlawful co-habitation, and in some cases pleas of guilty have been entered and a slight punishment imposed upon a promise by the accused that they would not again offend against the law, nor advise, counsel, aid, or abet, in any way, its violation by others.

The Utah Commissioners express the opinion, based upon such information as they are able to obtain, that but few polygamous marriages have taken place in the Territory during the last year. They further report that while there can not be found upon the registration lists of voters the name of a man actually guilty of polygamy, and while none of that class are holding office, yet at the last election in the Territory all the officers elected except in one county were men who, though not actually living in the practice of polygamy, subscribe to the doctrine of polygamous marriages as a divine revelation and a law unto all higher and more binding upon the conscience than any human law, local or national. This is the strange spectacle presented of a community protected by a republican form of government, to which they owe allegiance, sustaining by their suffrages a principle and a belief which sets at naught that obligation of absolute obedience to the law of the land which lies at the foundation of republican institutions.

The strength, the perpetuity, and the destiny of the nation rest upon our homes, established by the law of God, guarded by parental care, regulated by parental authority, and sanctified by parental love.

These are not the homes of polygamy.

The mothers of our land, who rule the nation as they mold the characters and guide the actions of their sons, live according to God's holy ordinances, and each, secure and happy in the exclusive love of the father of her children, sheds the warm light of true womanhood, unperverted and unpolluted, upon all within her pure and wholesome family circle.

These are not the cheerless, crushed, and unwomanly mothers of polygamy.

The fathers of our families are the best citizens of the republic. Wife and children are the sources of patriotism, and conjugal and parental affection beget devotion to the country. The man who, undefiled with plural marriage, is surrounded in his single home with his wife and children, has a stake in the country which inspires him with respect for its laws and courage for its defense.

These are not the fathers of polygamous families.

There is no feature of this practice, or the system which sanctions it, which is not opposed to all that is of value in our institutions.

There should be no relaxation in the firm but just execution of the law now in operation, and I should be glad to approve such further discreet legislation as will rid the country of this blot upon its fair fame.

Since the people upholding polygamy in our Territories are re-enforced by immigration from other lands, I recommend that a law be passed to prevent the importation of Mormons into the country.

The agricultural interest of the country demands just recognition and liberal encouragement. It sustains with certainty and unfailing strength our nation's prosperity by the products of its steady toil, and bears its full share of the burden of taxation without complaint. Our agriculturists have but slight personal representation in the councils of the nation, and are generally content with the humbler duties of citizen-

ship and willing to trust to the bounty of Nature for a reward of their labor. But the magnitude and value of this industry is appreciated when the statement is made that of our total annual exports more than three fourths are the products of agriculture, and of our total population nearly one half are exclusively engaged in that occupation.

The Department of Agriculture was created for the purpose of acquiring and diffusing among the people useful information respecting the subjects it has in charge, and aiding in the cause of intelligent and progressive farming by the collection of statistics, by testing the value and usefulness of new seeds and plants, and distributing such as are found desirable among agriculturists. This and other powers and duties with which this department is invested are of the utmost importance, and if wisely exercised must be of great benefit to the country. The aim of our beneficent Government is the improvement of the people in every station and the amelioration of their condition. Surely our agriculturists should not be neglected. The instrumentality established in aid of the farmers of the land should not only be well equipped for the accomplishment of its purpose, but those for whose benefit it has been adopted should be encouraged to avail themselves fully of its advantages.

The prohibition of the importation into several countries of certain of our animals and their products, based upon the suspicion that health is endangered in their use and consumption, suggests the importance of such precautions for the protection of our stock of all kinds against disease as will disarm suspicion of danger and cause the removal of such an injurious prohibition.

If the laws now in operation are insufficient to accomplish this protection, I recommend their amendment to meet the necessities of the situation, and I commend to the consideration of Congress the suggestions contained in the report of the Commissioner of Agriculture calculated to increase the value and efficiency of this department.

The report of the Civil-Service Commission, which will be submitted, contains an account of the manner in which the civil-service law has been executed during the last year, and much valuable information on this important subject.

I am inclined to think that there is no sentiment more general in the minds of the people of our country than a conviction of the correctness of the principle upon which the law enforcing civil-service reform is based. In its present condition the law regulates only a part of the subordinate public positions throughout the country. It applies the test of fitness to applicants for these places by means of a competitive examination, and gives large discretion to the commissioners as to the character of the examination and many other matters connected with its execution. Thus the rules and regulations adopted by the commission have much to do with the practical usefulness of the statute and with the results of its application.

The people may well trust the commission to execute the law with perfect fairness and with as little irritation as is possible. But of course no relaxation of the principle which underlies it and no weakening of the safeguards which surround it can be expected. Experience in its administration will probably suggest amendment of the methods of its execution, but I venture to hope that we shall never again be remitted to the system which distributes public positions purely as rewards for partisan service. Doubts may well be entertained whether our Government could survive the strain of a continuance of this system, which upon every change of administration inspires an immense army of claimants for office to lay siege to the patronage of Government, engrossing the time of public officers with their importunities, spreading abroad the contagion of their disappointment, and filling the air with the tumult of their discontent.

The allurements of an immense number of offices

and places, exhibited to the voters of the land, and the promise of their bestowal in recognition of partisan activity, debauch the suffrage and rob political action of its thoughtful and deliberative character. The evil would increase with the multiplication of offices consequent upon our extension, and the mania for office-holding, growing from its indulgence, would pervade our population so generally that patriotic purpose, the support of principle, the desire for the public good, and solicitude for the nation's welfare, would be nearly banished from the activity of our party contests, and cause them to degenerate into ignoble, selfish, and disgraceful struggles for the possession of office and public place.

Civil-service reform enforced by law came none too soon to check the progress of demoralization.

One of its effects, not enough regarded, is the freedom it brings to the political action of those conservative and sober men who, in fear of the confusion and risk attending an arbitrary and sudden change in all the public offices with a change of party rule, cast their ballots against such a chance.

Parties seem to be necessary, and will long continue to exist; nor can it be now denied that there are legitimate advantages, not disconnected with office-holding, which follow party supremacy. While partisanship continues bitter and pronounced, and supplies so much of motive to sentiment and action, it is fair to hold public officials in charge of important trusts responsible for the best results in the performance of their duties, and yet insist that they shall rely, in confidential and important places, upon the work of those not only opposed to them in political affiliation, but so steeped in partisan prejudice and rancor that they have no loyalty to their chiefs and no desire for their success. Civil-service reform does not exact this, nor does it require that those in subordinate positions who fail in yielding their best service, or who are incompetent, should be retained simply because they are in place. The whining of a clerk discharged for indolence or incompetency, who, though he gained his place by the worst possible operation of the spoils system, suddenly discovers that he is entitled to protection under the sanction of civil-service reform, represents an idea no less absurd than the clamor of the applicant who claims the vacant position as his compensation for the most questionable party work.

The civil-service law does not prevent the discharge of the indolent or incompetent clerk, but it does prevent supplying his place with the unfit party worker. Thus, in both these phases, is seen benefit to the public service. And the people who desire good government having secured this statute will not relinquish its benefits without protest. Nor are they unmindful of the fact that its full advantages can only be gained through the complete good faith of those having its execution in charge. And this they will insist upon.

I recommend that the salaries of the Civil-Service Commissioners be increased to a sum more nearly commensurate to their important duties.

It is a source of considerable and not unnatural discontent that no adequate provision has yet been made for accommodating the principal library of the Government. Of the vast collection of books and pamphlets gathered at the Capitol, numbering some 700,000, exclusive of manuscripts, maps, and the products of the graphic arts, also of great volume and value, only about 300,000 volumes, or less than half the collection, are provided with shelf-room. The others, which are increasing at the rate of from 25,000 to 30,000 volumes a year, are not only inaccessible to the public, but are subject to serious damage and deterioration from other causes in their present situation.

A consideration of the fact that the Library of the Capitol has twice been destroyed or damaged by fire, its daily increasing value, and its importance as a place of deposit of books under the law relating to copyright, make manifest the necessity of prompt action to insure its proper accommodation and protection.

My attention has been called to a controversy which

has arisen from the condition of the law relating to railroad facilities in the city of Washington, which has involved the commissioners of the District in much annoyance and trouble. I hope this difficulty will be promptly settled by appropriate legislation.

The commissioners represent that enough of the revenues of the District are now on deposit in the Treasury of the United States to repay the sum advanced by the Government for sewer improvements under the act of June 30, 1884. They desire now an advance of the share which ultimately should be borne by the District of the cost of extensive improvements to the streets of the city. The total expense of these contemplated improvements is estimated at \$1,000,000, and they are of the opinion that a considerable sum could be saved if they had all the money in hand, so that contracts for the whole work could be made at the same time. They express confidence that if the advance asked for should be made, the Government would be reimbursed the same within a reasonable time. I have no doubt that these improvements could be made much cheaper if undertaken together and prosecuted according to a general plan.

The license law now in force within the District is deficient and uncertain in some of its provisions, and ought to be amended. The commissioners urge, with good reason, the necessity of providing a building for the use of the District government which shall better secure the safety and preservation of its valuable books and records.

The present condition of the law relating to the succession to the Presidency in the event of the death, disability, or removal of both the President and Vice-President is such as to require immediate amendment. This subject has repeatedly been considered by Congress, but no result has been reached. The recent lamentable death of the Vice-President, and vacancies at the same time in all other offices the incumbents of which might immediately exercise the functions of the Presidential office, have caused public anxiety and a just demand that a recurrence of such a condition of affairs should not be permitted.

In conclusion, I commend to the wise care and thoughtful attention of Congress the needs, the welfare, and the aspirations of an intelligent and generous nation. To subordinate these to the narrow advantages of partisanship, or the accomplishment of selfish aims, is to violate the people's trust and betray the people's interests. But an individual sense of responsibility on the part of each of us, and a stern determination to perform our duty well, must give us place among those who have added in their day and generation to the glory and prosperity of our beloved land.

GROVER CLEVELAND.

WASHINGTON, December 8, 1885.

The Rules.—In the House of Representatives, Mr. Morrison, of Illinois, from the committee on rules, reported in favor of adopting the rules of the Forty-eighth Congress with certain amendments, some of which were so important in their scope as to cause warm discussion. One of them was designed to deprive the Committee on Appropriations of a great share of its powers, by referring the appropriations for carrying on certain departments to the committees appointed to deal with those departments. The report of the majority of the committee on rules said on this subject:

Rule XI is proposed to be amended by transferring certain of the general appropriation bills from the custody and control of the Committee on Appropriations to the following named committees, viz.: The consular and diplomatic bill to the Committee on Foreign Affairs; the army and Military Academy bills to the Committee on Military Affairs; the naval bill to the Committee on Naval Affairs; the post-office

bill to the Committee on the Post-Office and Post-Roads; and the Indian bill to the Committee on Indian Affairs. This leaves with the Committee on Appropriations the following-named bills, namely: Legislative, executive, and judicial, sundry civil, deficiency, fortification, pension, and District of Columbia bills, which include more than half the annual appropriations for carrying on the Government. The total appropriations for the fiscal year 1885-'86 are \$215,511,595.24, of which sum \$114,824,465.48 was appropriated in the bills last named. The remaining expenditures of the Government are provided for by permanent appropriations. The Committee on Appropriations was created on the 2d of March, 1865 (second session Thirty-eighth Congress), but was not appointed until the following Congress. Prior to its creation, the general appropriation bills were reported by the Committee on Ways and Means, which committee was further divided by the transfer of its jurisdiction on the subjects of banking and bank currency, and the Pacific Railroad to standing committees on those subjects. On the 14th of September, 1887 (first session Twenty-fifth Congress), the House adopted the following rule, viz.: "It shall also be the duty of the Committee on Appropriations, within thirty days after their appointment, at every session of Congress, commencing on the first Monday of December, to report the general appropriation bills." On the 2d of March, 1865, the House adopted the following amendment to the foregoing clause, viz., "or, in failure thereof, the reasons for such failure."

Under these provisions, the various appropriation bills were reported within the time prescribed, or the failure therefor explained, with but few exceptions, until the revision of the rules in the second session of the Forty-sixth Congress.

In that revision, the requirement as to reporting these bills was omitted, and from that time the general appropriation bills have been reported as the committee saw fit.

For nearly forty years of our history the appropriations were made in one act, entitled, "An act making appropriations for the support of the Government." The first separate bill for the expenses of the Post-Office Department was passed in 1844. In 1847 the appropriations were made in nine separate bills viz., army, civil and diplomatic, deficiencies, fortifications, Indians, Military Academy, navy, pensions, and post-office. In 1856, the consular and diplomatic appropriations were for the first time embodied in a separate bill. In 1857, the legislative, executive, and judicial bill first appeared in its present form. In 1862, the sundry civil bill was established, containing the various miscellaneous items not embraced in the other bills; and in 1880, the agricultural and District of Columbia bills were established, the agricultural bill being transferred to the Committee on Agriculture. With but few exceptions, the river and harbor bill was prepared and reported by the Committee on Commerce, until the creation of the Committee on Rivers and Harbors in 1883, when it was assigned to that committee. As showing the great increase of appropriations for the support of the Government, it may be stated that each one of our principal general appropriation bills embraces as much money as the whole amount of the net ordinary expenditures of the Government during the first ten years of its existence, and the specific objects to be investigated and provided for in these bills have so greatly increased in number that it has become a very considerable task even to enumerate them. For several years past, the various general appropriation bills have been reported at such late periods in the session as to preclude their careful and thorough investigation by members not on the Committee on Appropriations. The committee is of opinion that the distribution proposed will enable all these bills to be reported at earlier periods in the session, will permit a more careful and thorough consideration of each bill by the committee having jurisdiction of it, and also by the House, resulting in more

considerate and economic legislation, and will obviate the necessity for the passage of any of these bills under a suspension of the rules, which has been so frequently done in late years."

On the other hand, Mr. Randall, of Pennsylvania, in the minority report, said:

Before the war, the Committee of Ways and Means prepared and reported the necessary appropriation bills to execute the laws and carry on the Government, and it also arranged the taxes requisite to provide income sufficient to meet the proposed expenditures. Those who were for lessening taxes were of course in favor of economical expenditures, and those who were not, favored the largest appropriations. Instead of returning to the old system, it is proposed still further to separate these closely related and interdependent subjects. General appropriation bills are to be still further divided and scattered, and the result inevitably will be that it will be impossible to keep up any just relations between receipts and expenditures.

Experience and observation demonstrate such distribution leads to continually increasing appropriations, and renders it more difficult to keep expenditures within the limits of receipts. In the instances where appropriation bills have been taken from the Committee on Appropriations and given to the committees having charge of general legislation on the same subjects, it is susceptible of proof that those particular appropriations have steadily increased, and to such a degree that, if the same ratio of increase were to be followed in all the other appropriations, the result would be not only to exhaust the surplus revenue, but compel the levying of increased taxation.

The best interests of the people require that the subject of appropriations should mainly be committed to the charge of one committee—not that one set of men is abler or more honest than another set, but because experience has shown it is the safest course to pursue. Such body of men can make careful scrutiny into every detail by itself, and, in connection with others, and taking a survey of the whole field of receipts and expenditures, it will be responsible to the House to see to it that the latter shall be reduced to an economical basis, and kept within the limits of the public revenue.

If that responsibility be disseminated through many committees, it will become so loose and uncertain as to be lost altogether, and it is not unlikely, as we have been told in debate on this floor by men of the highest distinction in our councils, that if the proposed distribution of appropriation bills among the several committees shall take place it will be at the "peril of the public interests, and will release the grasp which the Committee on Appropriations can alone keep on the purse-strings of the Government." The result, as we have also been told, would "absolutely break down all economy and good order and good management of the finances."

Another of the important amendments recommended in the majority report was the striking out from the third clause of Rule XXI the following prohibition as to new legislation:

Nor shall any provision in any such bill or amendment thereto changing existing law be in order, except such as, being germane to the subject-matter of the bill, shall retrench expenditures by the reduction of the number and salary of the officers of the United States, by the reduction of the compensation of any person paid out of the Treasury of the United States, or by the reduction of amounts of money covered by the bill: *Provided*, That it shall be in order further to amend such bill upon the report of the committee having jurisdiction of the subject-matter of such amendment, which amendment, being germane to the subject-matter of the bill, shall retrench expenditures.

The advocates of this amendment contended that it would tend to prevent legislation in appropriation bills, while its opponents argued that it would result in the old practice of attaching all sorts of riders to such measures.

The third important amendment recommended by the majority of the Committee on Rules, was to change Rule XXIV so as "to establish a morning hour for the consideration of business reported from the committees of the House."

The sentiment in favor of a change in the old rules was overwhelming, and the proposed amendments were adopted. The principal feeling shown in the debate on the subject was one of jealousy as to the power formerly held by the Committee on Appropriations.

In discussing the joint rules of the two Houses of Congress, the Senate fell into a curious wrangle about Rule XIII, which is as follows:

No intoxicating liquors shall be offered for sale, exhibited, or kept within the Capitol, or in any room or building connected therewith, or on the public grounds adjacent thereto; and it shall be the duty of the respective Sergeants-at-Arms of the two Houses, under the supervision of the presiding officers thereof, respectively, to strictly enforce the foregoing provisions, and any officer or employé of either House who shall in any manner violate or connive at the violation of this rule shall be dismissed from office.

Mr. Vest, of Missouri, said: "I have no committee-room, and have no personal interest in this matter; but there is one thing in this rule which I have always opposed, and that is the system of espionage, of informers, which seems to be embraced within the provisions of this thirteenth rule. Every Senator here knows very well that his clerk or his doorkeeper who sees him—assuming the case to exist—with a jug, or a bottle, or a flask in his committee-room, under the provisions of this rule must inform upon him, or he will be put out of office. We know that will not be done; and we know no Senator would tolerate it. If this rule is enacted there ought to be an amendment to it that any member of either House or any employé who connived at keeping liquor in the Capitol should be expelled. Let us apply it to Senators and Representatives, and do not let us, if we propose to go into wholesale prohibition, put it on the humble employés of the Senate and escape ourselves. We know very well that any Senator who wants alcoholic stimulants in his committee-room will have them, and we know that he would inflict the severest punishment within his power on any appointee of his who would inform on him. All I ask is that equal justice shall be meted out to all. I am opposed myself to the spirit of the whole thing. I believe that it will do no good; that it encourages hypocrisy, and that it is simply an attempt of which no Senator would be guilty. It is tampering to a fanatical spirit in the country on this question, to which I, for one, will never give my counsel."

Mr. Saulsbury, of Delaware, on the other

hand, argued: "While I do not myself indulge in intoxicating liquors, I have no objection to gentlemen, who see proper, doing so, nor would I legislate to stop them from exercising the freest liberty; but, as a Senator called upon to say whether liquor shall be sold or exhibited around the Senate-chamber, I believe that the judgment of the country is that it ought to be stopped, and hence I voted for the proposed joint rule. I think it is a disgrace to the American people that the Capitol of the country, erected for the enactment of laws for the government of the people, should be converted into a grog-shop, or a place where liquor can be exhibited and sold, and where the youth of the land who come here, and who see proper to go to the restaurant, may purchase liquor. I think that we should not suffer this Capitol to become a grog-shop for the dissemination of intemperance throughout the land. I stand upon the resolution, firmly fixed in my own mind that such a joint rule ought to be passed, and that liquor should not be sold within the bounds of the Capitol."

Mr. Cockrell, of Missouri, said: "I propose that the same penalties shall be visited upon Senators that we propose to visit upon our subordinate officers for a violation of this rule. It is right, it is just. I have known appropriation committees a few times delayed by reason of intoxication among the subordinates. I have seen the Senate adjourn largely because of the excitement of some of its members and of the plain indications that unnecessary discussions were about to grow up. I do not say that the Senate had to adjourn in consequence of this fact, but certain Senators were so disposed to discussion that the public business would not have been carried on, discussion would have been prolonged indefinitely, and other Senators here know that that point is well taken."

Mr. Frye, of Maine, in vindication of the Senate against this imputation, said: "I am, on the whole, rather sorry that this discussion has arisen on this clause, because some things have been said here that Senators will regret to have said. I remember breakfasting with some distinguished Senators, five or six years ago, who were members of the United States Senate twenty or twenty-five years back. The father of the distinguished Senator from Pennsylvania at my right (Mr. Cameron) was one of them; Senator Hamlin, of Maine, was another. They began to relate reminiscences of the United States Senate, and they said that they had seen the Senate again and again without a quorum because more than a quorum was drunk. They had seen distinguished Senator after Senator undertake to rise in his seat to make a speech, and he could not rise because he was drunk. I have been in Congress some fifteen or sixteen years. When I first came into the national House of Representatives, take the night session, there would be a dozen members of the other House breaking up the

proceedings of the body, and making it a disgrace. That thing does not exist to-day; and I say to the Senator from Missouri that he is doing grave injustice to Senators on this floor, associated with him, by the remarks which he has made, sending out the impression to the country that so many Senators of the United States Senate were drunk in the ordinary business of the Senate that the Senate was obliged to suspend its business."

The Senate adopted the rule, after striking out the clause in regard to the punishment of offenders against its provisions.

The Presidential Succession.—In the first session of the Forty-seventh Congress a bill regulating the presidential succession was brought forward by Mr. Hoar, of Massachusetts, but it was not acted upon; in the first session of the Forty-eighth Congress the same bill substantially was brought forward again and passed by the Senate, but it was not taken up by the House of Representatives. On Dec. 15, 1885, the same measure was brought forward in the Senate. It is follows:

Be it enacted, etc., That in case of removal, death, resignation, or inability of both the President and Vice-President of the United States, the Secretary of State, or if there be none, or in case of his removal, death, resignation, or inability, then the Secretary of the Treasury, or if there be none, or in case of his removal, death, resignation, or inability, then the Secretary of War, or if there be none, or in case of his removal, death, resignation, or inability, then the Attorney-General, or if there be none, or in case of his removal, death, resignation, or inability, then the Postmaster-General, or if there be none, or in case of his removal, death, resignation, or inability, then the Secretary of the Navy, or if there be none, or in case of his removal, death, resignation, or inability, then the Secretary of the Interior, shall act as President until the disability of the President or Vice-President is removed or a President shall be elected: *Provided*, That whenever the powers and duties of the office of President of the United States shall devolve upon any of the persons named herein, if Congress be not then in session, or if it would not meet in accordance with law within twenty days thereafter, it shall be the duty of the person upon whom said powers and duties shall devolve to issue a proclamation convening Congress in extraordinary session, giving twenty days' notice of the time of meeting.

Sec. 2. That the preceding section shall only be held to describe and apply to such officers as shall have been appointed by the advice and consent of the Senate to the offices therein named, and such as are eligible to the office of President under the Constitution, and not under impeachment by the House of Representatives of the United States at the time the powers and duties of the office shall devolve upon them respectively.

Sec. 3. That sections 146, 147, 148, 149, and 150 of the Revised Statutes are hereby repealed.

The provisions of the Revised Statutes to be repealed under the last section are those settling the order of succession upon the President *pro tempore* of the Senate and the Speaker of the House of Representatives in case of the removal, death, resignation, or inability of the President and Vice-President, and providing for a new election. The idea of the bill, Mr. Hoar said, was taken from his brother, formerly Attorney-General in Grant's Cabinet. In

support of the measure, among other things, the Senator from Massachusetts said: "As it has been said, the immediate occasion for this bill, which has given it its prominence in public estimation, although it has passed the Senate once or twice when there was no such contingency—the immediate occasion of this bill is the impression upon the public mind of the grave and serious necessity for casting new safeguards about the life of the President of the United States; it is clear, as I said just now in another connection, that the security against the attempts on the life of the President by any political criminal in a time of great public excitement, when persons are maddened and crazed as the feeble mind of Guiteau was by a political quarrel, or a person who persuades himself that he is performing the part of a Brutus, by ridding the country of a tyrant, who is sane—will be much greater under this bill than under existing law. The motive which affects their minds, and which has affected at least two such minds in our country, will continue to affect them if a new election of President is to be the result of the removal of the President and Vice-President. But if the principal adviser, the principal leader and exponent of the policies and principles of the party that elected the existing President, is to succeed to the office, and so in turn his other Cabinet advisers, that motive is entirely gone. And it is not a man, it is under the theory of our Constitution a principle of political conduct for which the people of the United States declare when they elect a President and Vice-President; and that is continued by the provisions of this bill."

Mr. Maxey, of Texas, in advocacy of the measure, argued: "It has been said that the President of the Senate and the Speaker of the House should be selected because they come from the people; that the Secretary of State and the Secretary of the Treasury, and so on, should not be because they do not. The President of the Senate does not come by election from the people of the United States. I have shown that he is not an officer of the United States. He comes from his State and holds his commission from his State, and the influences, whatever they may be, brought to bear upon the action of a Senator in this body are brought by the people of his State. The Speaker of the House is not an officer of the United States, does not come from the United States by election of the people of the United States, but from the election of one of the districts in his State. The Secretary of State is an officer of the United States beyond all possible question. He is appointed by authority of the Constitution of the United States; he holds his commission by and with the advice and consent of the Senate of the United States, and he is selected by the President, whatever may be the policy of the President, because he is in accord with the policy which the President proposes to pursue in his Administration.

So that, whether the President be a Republican or a Democrat, whatever he may be, it is carrying out the will of the people as nearly as it is possible for us to do should the unfortunate occurrence come about that we have no President or Vice-President when we place in his stead a man whose politics are in accord with those of the people as indicated by their election of President and Vice-President. Therefore, in my judgment, not only because these are officers of the United States, but because they are the proper officers, I believe the provisional successor should come from that line."

Mr. Edmunds, of Vermont, said, in criticism of the measure: "If I were to regulate this matter (as I know from the present situation and from the opinion of a majority of the Senate I am not to do), or if I were to assist in regulating it, I should leave the substance of the law to stand exactly where it is now, but I should add to it by providing that the House of Representatives should meet and organize on the 4th day of March, when its term begins, so that the country would have four lives between the execution of its executive office and chaos. That would meet everything except a contingency that would not happen once in a hundred thousand years probably before a new election could be had. That is what I would have, and I would have it upon the solid principle, which I believe in, that it was the intention and the necessary scheme of a government of the people that when a vacancy occurred in the office of Chief Magistrate whom the people had elected the representatives of that people, through its States and through its House of Representatives, should be the guardians of that high political office until the voice of the people could be taken again in the selection of a Chief Magistrate elected directly, and that it was not their intention and that it was not in accordance with the true philosophy of republican and democratic government that the President of the United States shall be authorized to name the man who in case of his disability shall be President in his stead, and, as this bill has it, it may be for three years eleven months and twenty-nine days.

"It approaches in its nature to the exertion of a royal prerogative of the king in his will or in some way naming the regent who shall perform the functions of the Executive office in a kingdom during the minority of the heir-apparent. I do not believe in it. And this bill in this respect of continuing the exertion of the presidential power in the hands of the Secretary of State, whoever he may be—and of course I am not speaking of persons at all, because I have a very high personal regard and respect for the present Secretary of State—but the continuing in his hands, or by another accident in the hands of some one of six or seven men, the absolute possession of the Executive office by designation of the President and his selection for almost the whole of

a term of four years, without any power in the States or the people to change it or to have a new election, is, with great respect to this committee, contrary to my ideas of good and safe republican government."

Mr. Edmunds moved to amend the bill by striking out so much of the third section as provided for the repeal of sections 147, 148, 149, and 150 of the Revised Statutes; so that only section 146, which vested the succession in the President *pro tempore* of the Senate and the Speaker of the House of Representatives, should be repealed. This amendment was defeated by the following vote:

YEAS—Aldrich, Blair, Cameron, Cockrell, Conger, Edmunds, Hawley, McMillan, Mahone, Manderson, Mitchell of Pennsylvania, Morrill, Palmer, Plumb, Sewell, Sherman, Spooner, Stanford, Teller, Vance, Vest—21.

NAYS—Allison, Beck, Berry, Blackburn, Brown, Butler, Call, Chace, Coke, Colquitt, Cullom, Dolph, Eustis, Evans, Frye, George, Gibson, Gorman, Gray, Harris, Harrison, Hoar, Ingalls, Jackson, Jones of Arkansas, Logan, Maxey, Mitchell of Oregon, Morgan, Platt, Pugh, Ransom, Saulsbury, Voorhees, Walhall, Wilson of Iowa, Wilson of Maryland—37.

Absent—Bowen, Camden, Dawes, Fair, Hale, Hampton, Jones of Florida, Jones of Nevada, Kenna, McPherson, Miller of California, Miller of New York, Payne, Pike, Riddleberger, Sabin, Sawyer, Van Wyck—18.

The bill was then passed, without a division, on December 17, 1885.

On Jan. 12, 1886, the measure was reported to the House from the select committee on the election of President and Vice-President, and Jan. 13 it was read; Jan. 14 it was debated; and Jan. 15 it passed the House. The discussion in that body was fuller than the discussion in the Senate, because there the subject was new. The great point at issue was the constitutionality of a law under which an appointive officer might in certain contingencies become President for four years. Mr. Cooper, of Ohio, put the argument as follows: "If there be no reasonable doubt that the provisions of this bill would apply as well to a President and Vice-President elect as to a President and Vice-President who have been inaugurated, then I suggest most serious objections which have occurred to me. First, I am profoundly doubtful of the constitutionality of a provision which would vest, as this bill, in one contingency, would vest, the presidency for a full term of four years in an officer appointed by an outgoing Administration. Sir, I believe this to be in violation, not only of the letter and spirit of the Constitution, but of the spirit out of which the Constitution arose. The letter of the Constitution is that the President shall be 'elected'; not that a man who may hold office under the President shall act as President, but that the President shall be elected; and it goes on to provide how he shall be elected.

"It was wise in the fathers to provide that the incumbent of this high office for any length of time should ever know and ever be

reminded that he owed his position to the people; that he was under obligation to the people for it, and responsible to the people for the proper discharge of his duties; and any legislation which tends to widen the space between the President and the people is, I submit, unwise legislation. And this bill, which provides for the holding of the office of President for a full presidential term by a man who had not been elected and may only be a member of an Administration which may have been defeated, repudiated, and dead, is in express violation of the Constitution, and this was the opinion of the Senate Judiciary Committee of 1856."

An amendment, proposed by the minority of the select Committee on an Election of President and Vice-President, to insert in the first section the clause "or whenever the offices of President and Vice-President of the United States become vacant," was rejected; an amendment submitted by Mr. Adams, of Illinois, to repeal only sections 146 and 150 of the Revised Statutes was also rejected by a vote of 113 yeas to 153 nays. Mr. Cooper, of Ohio, moved to amend by striking out all of section 8 and inserting the following:

In the event of the death or constitutional inability of the President-elect, or failure to assume his office, the Vice-President shall act as President the same as if such death or inability had occurred after his inauguration.

This amendment was likewise rejected. Mr. McKinley, of Ohio, offered the following substitute, which was rejected by 108 to 159:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, In case of removal, death, resignation, or inability of both the President and Vice-President of the United States, the President of the Senate, or, if there is none, then the Speaker of the House of Representatives, for the time being, shall act as President until the disability is removed or a President elected. And for the purpose of having a Speaker of the House of Representatives in office continuously, the Congress shall convene at 12 o'clock m. on the 4th day of March next succeeding the election of Representatives in Congress; and whenever a vacancy exists either in the office of the President *pro tempore* of the Senate or Speaker of the House, the President shall convene the House in which the vacancy exists for the purpose of electing a presiding officer.

SECTION 2. Whenever the offices of President and Vice-President both become vacant, the Secretary of State shall forthwith cause a notification thereof to be made to the Executive of every State, and shall also cause the same to be published in at least one of the newspapers printed in each State.

SEC. 3. The notification shall specify that electors of a President and Vice-President of the United States shall be appointed or chosen in the several States as follows:

First. If there shall be the space of two months yet to ensue between the date of such notification and the first Wednesday in December then next ensuing, such notification shall specify that the electors shall be appointed or chosen within thirty-four days preceding such first Wednesday in December.

Second. If there shall not be the space of two months between the date of such notification and such first Wednesday in December, and if the term for which the President and Vice-President last in

office were elected will not expire on the 3d day of March next ensuing, the notification shall specify that the electors shall be appointed or chosen within thirty-four days preceding the first Wednesday in December in the year next ensuing. But if there shall not be the space of two months between the date of such notification and the first Wednesday in December then next ensuing, and if the term for which the President and Vice-President last in office were elected will expire on the 3d day of March next ensuing, the notification shall not specify that electors are to be appointed or chosen.

Sec. 4. Electors appointed or chosen upon the notification prescribed by the preceding section shall meet and give their votes upon the first Wednesday of December specified in the notification.

Sec. 5. The provisions of this title, relating to the quadrennial election of President and Vice-President shall apply with respect to any election to fill vacancies in the offices of President and Vice-President, held upon a notification given when both offices become vacant.

Sec. 6. The only evidence of a refusal to accept, or of a resignation of the office of President or Vice-President, shall be an instrument in writing, declaring the same, and subscribed by the person refusing to accept or resign, as the case may be, and delivered into the office of the Secretary of State.

The yeas and nays on this amendment were as follow:

Mr. Ryan, of Kansas, moved to recommit the bill as follows:

Recommit the bill with instructions to report as a substitute a resolution, submitting an amendment to the Constitution providing one or more additional Vice-Presidents, upon whom, in their order, the office of President shall devolve in case of the removal, death, resignation, or inability both of President and Vice-President.

Mr. Everhart, of Pennsylvania, offered the following substitute for the instructions embodied in Mr. Ryan's motion :

That in case of the removal, death, resignation, or inability of both the President and Vice-President of the United States, the following persons, if eligible to the office of President, and not under impeachment or indictment at the time being, shall, respectively, in the order and on the contingencies hereinafter named, act as President of the United States until the disability of the President and Vice-President be removed or President shall be elected: First, the Speaker of the House of Representatives; or if there be no Speaker, or if there be and he decline, or as President, die, resign, be removed, or be unable to act as such, then, second, the President *pro tempore* of the Senate; or if there be no President *pro tempore* of the Senate, or if there be and he decline, or as President, die, resign, be removed, or be unable to act as such, then, fourth, the Chief-Justice of the Supreme Court of the United States, having been legally confirmed; or if there be no Chief-Justice, or if there be and he decline, or, as President, die, resign, be removed, or be unable to act as such, then, fifth, the Secretary of the Treasury of the United States, having been legally confirmed; or if there be no Secretary of the Treasury, or if there be and he decline, or, as President, die, resign, be removed, or be unable to act as such, then, sixth, the Attorney-General of the United States, having been legally confirmed: *Provided*, That when any of the persons above named shall, as aforesaid, become President, he shall not exercise the functions of any other public office of trust or profit while President, and shall, within thirty days thereafter, issue a proclamation to the people of the United States, and direct notice to be given that, in accordance with the provisions of the act of March, 1, 1792, electors of President and Vice-President of the United States shall be elected or appointed in the several States.

SECTION 2. That all laws inconsistent herewith are hereby repealed.

This substitute, as well as a less important amendment proposed, was lost, and then the motion to recommit was rejected. The final vote on the passage of the bill was as follows:

YEAS—C. H. Allen, C. M. Anderson, Arnot, Atkinson, Baker, Barbour, Barksdale, Barnes, Barry, Beach, Blanchard, Bland, Bliss, Blount, Boyle, Bragg, C. R. Breckinridge, W. C. P. Breckinridge, T. M. The President approved the bill, Jan. 19, 1886.

The Oleomargarine Law.—April 28, 1886, Mr. Hatch, of Missouri, from the Committee on Agriculture of the House of Representatives, reported a bill defining butter, and imposing a tax upon and regulating the manufacture, sale, importation, and exportation of oleomargarine. The measure was fully debated. Mr. Scott, of Pennsylvania, said in support of it: "It is needless for me to speak of the importance to a nation of throwing every pos-

sible safeguard about its agricultural interests. They who devote their entire lives to the production of those articles which are relied upon for the sustenance of the people have a primal right to make known their grievances and to persist in their appeals until at least a measure of relief is afforded. The farmer is never aggressive, but always patient. His hours of toil are not limited to the period between the rising and setting of the sun; he suffers hardships in his battles with Nature, but his struggles are the struggles of peace; he is always law-abiding, and never fractious. True to the independent characteristics of his calling, he is slow to invite others to his assistance; and when that appeal is made it should be answered with a promptness that attests the nation's confidence in his statements and appreciation of his worth. Within a period of less than ten years a gigantic traffic has grown up which has already displaced one fifth of the purest product of the dairy, and substituted therefor an article the ingredients of which are acknowledged to be not only offensive in their original character to human taste, but positively injurious to the public health. So rapidly has this traffic developed, and so vast have its proportions become, that State Legislatures have been powerless to arrest its growth, and the national Congress is finally appealed to to pass laws that shall at least check its further disastrous advance."

Touching the constitutional authority to levy the tax provided for in the bill he said:

"The Congress of the United States unquestionably possesses the right to tax any industry or any commodity, however innocent in its effects. The harmless article of salt, which enters so largely into the manufacture of butter, carries with it the enormous tax of 23¢ per cent., while whisky is taxed 90 cents per gallon, with the avowed object of restricting its sale because of the baneful influence which springs therefrom. There are those who favor the taxation of oleomargarine to the point of extermination, but with these I can not agree. If there are those who prefer oleomargarine to the genuine butter, the manufacturer should be allowed to supply that demand; but, in my judgment, he should be required to pay a tax sufficient at least to equalize the difference in the cost of producing the counterfeit and the cost of producing the genuine article which he seeks to imitate and displace."

Mr. Reagan, of Texas, in opposition to the measure, said: "If the object was to tax oleomargarine for revenue, it would be within the power of Congress to levy such a tax, but the object manifestly being to drive it out of existence, to destroy it as a product, there is, in my judgment, no power under the Constitution authorizing the passage of such a bill. We nowhere in the Constitution find any power authorizing Congress to destroy any product or to outlaw any article. There is no such power. The States may, if they see proper to do so, but

we have not been informed that any State has attempted to do it, and if the community suffers the injury which it is alleged grows out of the manufacture and use of oleomargarine, it is singular indeed that the people in the several States have not discovered that fact and applied the remedy which they clearly have the power to apply in such cases."

Mr. Hiscock, of New York, maintained the right of Congress to tax any industry either simply for revenue or for the protection of another: "I ask gentlemen upon the other side of the House, who always have or profess to have special charge of the Constitution, when has there ever been a time in the history of our country, when, for the purpose of taxation, we have not discriminated in favor of one industry and against another? It is conceded on all hands that under the taxing power we can tax the manufacture of any product out of existence, and where then is the ground for opposition to this bill? It has always been conceded by every statesman, or less, who has ever discussed a tax law, that it was proper to discriminate in favor of, protect, if you please, one industry if it needed it, as against another. This can not be disputed, and who challenges the assertion?

"Gentlemen have been appealed to and put upon their consciences and oaths, in delivering their votes upon this bill. Well, by our votes, one industry is to be stricken down; that great industry in favor of which three fourths of all the States have legislated—agriculture, an industry from which this country derives practically all of the wealth it has—or we are to foster and support it. What is asked? That in levying taxes we will give it incidental protection as against a compound which has been declared by those who have examined it to be vile in its component parts, and carrying with it the germs of insidious disease, a fraudulent, spurious article, which is palmed off upon the poor as an honest product of the dairy."

Mr. Curtin, of Pennsylvania, attacked both the principle and the policy of the bill: "I believe the whole system of internal taxation is wrong, unjust, and not needed by this Government, and I do most decidedly object to making any addition to it. And as to the quality of this food, after all, Mr. Chairman, it is the American man who must judge of what he shall eat and give to his family. The average American man is quite capable of judging whether butter made in this manner is good or bad for him—whether it is a wholesome article of food or whether it is a source of contagious disease. With my experience of life, I am willing to submit to every American citizen what is best for himself and family, and the Congress of the United States can neither regulate his independence of action nor appetite. I admit, however, that it is the right and duty of the Government to inquire into the wholesomeness of this food, and to make the

inquiry as strict as may be, but even if investigation shows that it is not fit food for the people, let us not attempt to destroy it by taxing it out of existence. The more you tax the American man the less he likes it. As to food, there is a great variety of taste. When I was abroad, I saw a man on the Neva, from the frozen regions of the North, eat a tallow-candle, and he looked as happy and cheerful and complacent, and smiled as pleasantly as my friend the gentleman from New York and my colleague from Pennsylvania would after an elaborate dinner at Delmonico's."

Mr. Tucker, of Virginia, conceding the power of Congress to levy the tax provided for in the bill, protested against perverting the powers given for one purpose to another: "I believe that Congress has the power to lay the tax on oleomargarine. For what purpose? To raise revenue. Can you use a power—I put it to any gentleman here who has ever been a trustee—can you use a power delegated to you as a trustee for a certain purpose for some other purpose that is denied to you in the trust? Can you use that as a weapon to destroy some industry that is not within your power, merely because you have that weapon to use for the purpose of raising revenue? The question to me is too plain. I do not mean to judge for any other man's conscience, but I mean to say that honestly I could not vote for such a use of the power, because to use a power given to me for one purpose in order to accomplish another purpose that I have no power to subserve is really dishonest. It is evading my constitutional obligation to exercise a power which was never given me for the purpose at all for the purpose of accomplishing an object not confined to me by the Constitution."

Mr. Henderson, of Iowa, argued that the levying of new tax was in some sort a financial necessity: "As will be seen, the Secretary of the Treasury estimates that there will be a deficit of \$24,589,000 on the 30th day of June, 1887, and he states in detail the basis for his conclusion. Now, this is not any rambling statement. It is a careful official estimate submitted by the official financial head of the republic. In addition to that, this Congress, with a patriotism that I commend, has added to the pensions of the widows and orphans of the Union soldier \$6,000,000 per annum, not taken into account by the Secretary of the Treasury, but which will be added to the expenses of the Government, thus raising the amount of the deficit to \$30,000,000. Then, if the Mexican pension bill goes through the Senate as it has gone through the House, we shall have from forty to fifty millions more to pay. I need not call the attention of the House to the fact that we have a vast debt still unpaid, that we have appealing rivers and harbors, that public buildings are needed—nearly every State demanding them—until we are afraid we have not money enough to give all that is needed. I need not remind this Chamber that the Army

of the United States has been reduced to a platoon, and the Navy to a naked flag-staff. I do not need to remind this Chamber that we have no merchant marine; and let it not be forgotten that the idol of one great party in this nation, "the Old Sage of Gramercy," has counseled and appealed for the expenditure of millions for our coast-defenses. We stand to-day a stingy and cramped nation in regard to many needed expenditures; and I say, with Secretary Manning, that we do need this money." He declared, moreover, that it was not of any practical importance whether the law was passed to raise revenue or to crush out a particular branch of industry, since the real purpose in passing it could not be separated from the professed purpose: "The judicial power dare not enter the chamber of the lawmaker's mind to find motives for the passage of a law, but is bound to accept the law itself for that guide. We have a right under the Constitution to levy and collect taxes. Here we are deciding whether it is necessary or not to do that. We exercise the power; and the mode of its exercise can not be questioned by the highest judicial tribunal in the republic. I say, then, it is a waste of time to discuss this bill from a constitutional standpoint." Mr. Henderson also dwelt at length upon the excellence of butter and the filthiness of oleomargarine, and produced a formidable mass of figures to show how seriously the manufacture of the latter was affecting the agricultural interest of the country.

Perhaps the best statement made in behalf of the bill, however, is embodied in the report of the Committee on Agriculture. As to the constitutionality of the measure the report said:

The power of the Federal Government to impose an internal-revenue tax upon the manufactured compounds sold as imitations and counterfeits of butter, as enumerated in the second section of the substitute bill reported by the committee, is too well established by a long line of precedents to require any argument; indeed, as far as your committee are advised, this power is unquestioned and universally conceded by those who deny the necessity or expediency of such a tax. This power to tax is not limited alone to the necessities of the Government for the amount of revenue derived. It has been invoked in more than one instance to provide for the general welfare and sustained by the highest judicial tribunal of the land. It is contended by some that the tax on oleomargarine, as defined in the bill, is excessive, and is advocated for the purpose of destroying or impairing its manufacture and sale, and is, therefore, beyond the constitutional power of Congress. It is a sufficient answer to this to say that, the power to tax being conceded, there is no limitation to its exercise except the discretion and wisdom of Congress.

As to the necessity for the proposed legislation the report said:

We find that there are in the United States over 15,000,000 cows, producing annually over 1,000,000,000 pounds of butter and 300,000,000 pounds of cheese, and that the product is worth \$250,000,000; that about an equal amount of milk is consumed as milk, so that the product of the dairy interest of the United States is worth \$500,000,000; that cows were worth on an average \$40 per head until the introduction of counterfeit butter, and are now worth but \$30 each, mak-

ing a total loss of \$150,000,000 in milk-cattle alone; that during last year there were slaughtered in Chicago alone about 300,000 milk-cows, or an average of about 1,000 per day; that there are from four to five million American citizens engaged in the dairy business, and that they must all abandon it and be driven into some other already overworked branch of industry unless they can be relieved from the present ruinous competition with cheap imitations of butter and cheese; that the dairy interest is a necessity to all other branches of agriculture, as it is the cheapest and most reliable means of producing or continuing the conditions of soil necessary to the production of crops of grain and grass; that the cost of producing the usual imitations of butter is from seven to eight cents a pound, and the cost to the consumer has been and is about equal with the price of genuine butter; that such imitations are not only disastrous to the dairy interest directly and to all branches of agriculture indirectly, but that they are detrimental to public health, being the fruitful cause of dyspepsia and other diseases; that among the articles and ingredients used in the manufacture of such imitations there are the following: Nitric acid, sugar of lead, sulphate of lime, benzoic acid, butyric acid, glycerine, capric acid, commercial sulphuric acid, tallow, butyric ether, castor-oil, caul, gastric juice, curcumin, chloride of potash, peroxide of magnesia, nitrate of soda, dry-blood albumen, saltpeter, borax, orris-root, bicarbonate of soda, caprylic acid, sulphite of soda, pepsin, lard, caustic potash, chalk, oil of sesame (or benne), turnip-seed oil, oil of sweet almonds, stomach of pigs, sheep, or calves, mustard-seed oil, bicarbonate of potash, boracic acid, salicylic acid, cotton-seed oil, alum, cows' udders, sal-soda, farinaceous flour, carabolic acid, slippery-elm bark, olive-oil, bromo-chloralum, oil of peanuts, sugar, caustic soda.

The bill passed the House, June 3, as follows:

Be it enacted, etc., That, for the purposes of this act, the word "butter" shall be understood to mean the food-product usually known as butter, and which is made exclusively from milk or cream, or both, with or without common salt, and with or without additional coloring-matter.

Sec. 2. That, for the purposes of this act, certain manufactured substances, certain extracts, and certain mixtures and compounds, including such mixtures and compounds with butter, shall be known and designated as "oleomargarine," namely: All substances heretofore known as oleomargarine, olio, oleomargarine-oil, butterine, lardine, suine, and neutral; all mixtures and compounds of oleomargarine, olio, oleomargarine-oil, butterine, lardine, suine, and neutral; all lard extracts and tallow extracts; and all mixtures and compounds of tallow, beef-fat, suet, lard, lard-oil, vegetable-oil, annatto, and other coloring-matter, intestinal fat, and offal-fat made in imitation or semblance of butter, or calculated or intended to be used as butter or for butter.

Sec. 3. That special taxes are imposed as follow: Manufacturers of oleomargarine shall pay \$600. Every person who manufactures oleomargarine for sale shall be deemed a manufacturer of oleomargarine.

Wholesale dealers in oleomargarine shall pay \$480. Every person who sells or offers for sale oleomargarine in the original manufacturer's packages shall be deemed a wholesale dealer in oleomargarine. But any manufacturer of oleomargarine who has given the required bond and paid the required special tax, and who sells only oleomargarine of his own production at the place of manufacture in the original packages to which the tax-paid stamps are affixed, shall not be required to pay the special tax of a wholesale dealer in oleomargarine on account of such sales.

Retail dealers in oleomargarine shall pay \$48. Every person who sells oleomargarine in less quantities than ten pounds at one time shall be regarded as a retail dealer in oleomargarine. And sections 3232, 3233, 3234, 3235, 3236, 3237, 3238, 3239, 3240, 3241, and 3243

of the Revised Statutes of the United States are, so far as applicable, made to extend to and include and apply to the special taxes imposed by this section and to the persons upon whom they are imposed: *Provided*, That in case any manufacturer of oleomargarine commences business subsequent to the 30th day of June in any year, the special tax shall be reckoned from the 1st day of July in that year, and shall be \$500.

SEC. 4. That every person who carries on the business of a manufacturer of oleomargarine without having paid the special tax therefor as required by law, shall, besides being liable to the payment of the tax, be fined not less than one thousand and not more than five thousand dollars; and every person who carries on the business of a wholesale dealer in oleomargarine without having paid the special tax therefor as required by law, shall, besides being liable to the payment of the tax, be fined not less than five hundred nor more than two thousand dollars; and every person who carries on the business of a retail dealer in oleomargarine without having paid the special tax therefor as required by law, shall, besides being liable to the payment of the tax, be fined not less than fifty nor more than five hundred dollars for each and every offense.

SEC. 5. That every manufacturer of oleomargarine shall file with the collector of internal revenue of the district in which his manufactory is located such notices, inventories, and bonds, and shall keep such books and render such returns of materials and products, shall put up such signs and affix such number to his factory, and conduct his business under such surveillance of officers and agents as the Commissioner of Internal Revenue, with the approval of the Secretary of the Treasury, may by regulation require. But the bond required by such manufacturer shall be with sureties satisfactory to the Collector of Internal Revenue, and in a penal sum of not less than \$5,000; and the sum of said bond may be increased from time to time and additional sureties required at the discretion of the collector or under instructions of the Commissioner of Internal Revenue.

SEC. 6. That all oleomargarine shall be packed by the manufacturer thereof in firkins, tubs, or other wooden packages not before used for that purpose, each containing not less than ten pounds, and marked, stamped, and branded as the Commissioner of Internal Revenue, with the approval of the Secretary of the Treasury, shall prescribe; and all sales made by manufacturers of oleomargarine and wholesale dealers in oleomargarine shall be in original stamped packages. Retail dealers in oleomargarine must sell only from original stamped packages, in quantities not exceeding ten pounds, and shall pack the oleomargarine sold by them in suitable wooden or paper packages, which shall be marked and branded as the Commissioner of Internal Revenue, with the approval of the Secretary of the Treasury, shall prescribe. Every person who sells or offers for sale, or delivers or offers to deliver, any oleomargarine in any other form than in new wooden or paper packages above described, or who packs in any package any oleomargarine in any manner contrary to law, or who falsely brands any package, or affixes a stamp on any package denoting a less amount of tax than that required by law, shall be fined for each offense not less than \$100 nor more than \$1,000, and be imprisoned not less than six months nor more than two years.

SEC. 7. That every manufacturer of oleomargarine shall securely affix, by pasting on each package containing oleomargarine manufactured by him, a label on which shall be printed, besides the number of the manufactory and the district and State in which it is situated, these words: "Notice.—The manufacturer of the oleomargarine herein contained has complied with all the requirements of law. Every person is cautioned not to use either this package again or the stamp thereon again, nor to remove the contents of this package without destroying said stamp, under the penalty provided by law in such cases." Every

manufacturer of oleomargarine who neglects to affix such label to any package containing oleomargarine made by him, or sold or offered for sale by or for him, and every person who removes any such label so affixed from any such package, shall be fined \$50 for each package in respect to which such offense is committed.

SEC. 8. That upon oleomargarine which shall be manufactured and sold, or removed for consumption or use, there shall be assessed and collected a tax of five cents per pound, to be paid by the manufacturer thereof; and any fractional part of a pound in a package shall be taxed as a pound. The tax levied by this section shall be represented by coupon stamps; and the provisions of existing laws governing the engraving, issue, sale, accountability, effacement, and destruction of stamps relating to tobacco and snuff, as far as applicable, are hereby made to apply to stamps provided for by this section.

SEC. 9. That whenever any manufacturer of oleomargarine sells, or removes for sale or consumption, any oleomargarine upon which the tax is required to be paid by stamps, without the use of the proper stamps, it shall be the duty of the Commissioner of Internal Revenue, within a period of not more than two years after such sale or removal, upon satisfactory proof, to estimate the amount of tax which has been omitted to be paid, and to make an assessment therefor and certify the same to the collector. The tax so assessed shall be in addition to the penalties imposed by law for such sale or removal.

SEC. 10. That all oleomargarine imported from foreign countries shall, in addition to any import duty imposed on the same, pay an internal-revenue tax of fifteen cents per pound, such tax to be represented by coupon stamps as in the case of oleomargarine manufactured in the United States. The stamps shall be affixed and canceled by the owner or importer of the oleomargarine while it is in the custody of the proper custom-house officers; and the oleomargarine shall not pass out of the custody of said officers until the stamps have been so affixed and canceled, but shall be put up in wooden packages, each containing not less than ten pounds, as prescribed in this act for oleomargarine manufactured in the United States, before the stamps are affixed; and the owner or importer of such oleomargarine shall be liable to all the penal provisions of this act prescribed for manufacturers of oleomargarine manufactured in the United States. Whenever it is necessary to take any oleomargarine so imported to any place other than the public stores of the United States for the purpose of affixing and canceling such stamps, the collector of customs of the port where such oleomargarine is entered shall designate a bonded warehouse to which it shall be taken, under the control of such customs officer as such collector may direct; and every officer of customs who permits any such oleomargarine to pass out of his custody or control without compliance by the owner or importer thereof with the provisions of this section relating thereto, shall be guilty of a misdemeanor, and shall be fined not less than \$1,000 nor more than \$5,000, and imprisoned not less than six months nor more than three years. Every person who sells or offers for sale any imported oleomargarine, or oleomargarine purporting or claimed to have been imported, not put up in packages and stamped as provided by this act, shall be fined not less than \$500 nor more than \$5,000, and be imprisoned not less than six months nor more than two years.

SEC. 11. That every person who purchases or receives for sale any oleomargarine which has not been branded or stamped according to law, shall be liable to a penalty of \$50 for each such offense.

SEC. 12. That every person who purchases or receives for sale any oleomargarine from any manufacturer who has not paid the special tax shall be liable for each offense to a penalty of \$100 and to a forfeiture of all articles so purchased or received, or of the full value thereof.

SEC. 13. That whenever any stamped package containing oleomargarine is emptied, it shall be the duty of the person in whose hands the same is to destroy utterly the stamps thereon; and any person who willfully neglects or refuses so to do shall for each such offense be fined not exceeding \$50, and imprisoned not less than ten days nor more than six months. And any person who fraudulently gives away or accepts from another, or who sells, buys, or uses for packing oleomargarine any such stamped package, shall for each such offense be fined not exceeding \$100, and be imprisoned not more than one year. Any revenue officer may destroy any emptied oleomargarine package upon which the tax-paid stamp is found.

SEC. 14. That there shall be in the office of the Commissioner of Internal Revenue an analytical chemist and a microscopist, who shall each be appointed by the Secretary of the Treasury, and shall each receive a salary of \$2,500 per annum; and the Commissioner of Internal Revenue may, whenever in his judgment the necessities of the service so require, employ chemists and microscopists, to be paid such compensation as he may deem proper, not exceeding in the aggregate any appropriation made for that purpose. And such Commissioner is authorized to decide what substances, extracts, mixtures, or compounds which may be submitted for his inspection in contested cases are to be taxed under this act; and his decision in matters of taxation under this act shall be final. The Commissioner may also decide whether any substance made in imitation or semblance of butter, and intended for human consumption, contains ingredients deleterious to the public health; but in case of doubt or contest his decisions in this class of cases may be appealed from to a board hereby constituted for the purpose, and composed of the Surgeon-General of the Army, the Surgeon-General of the Navy, and the Commissioner of Agriculture; and the decisions of this board shall be final in the premises.

SEC. 15. That all packages of oleomargarine subject to tax under this act that shall be found without stamps or marks as herein provided, and all oleomargarine intended for human consumption which contains ingredients adjudged as hereinbefore provided, to be deleterious to the public health, shall be forfeited to the United States. Any person who shall willfully remove or deface the stamps, marks, or brands on packages containing oleomargarine taxed as provided herein shall be guilty of a misdemeanor, and shall be punished by a fine of not less than \$100 nor more than \$2,000, and by imprisonment for not less than thirty days nor more than six months.

SEC. 16. That oleomargarine may be removed from the place of manufacture for export to a foreign country without payment of tax or affixing stamps thereto, under such regulations and the filing of such bonds and other security as the Commissioner of Internal Revenue, with the approval of the Secretary of the Treasury, may prescribe. Every person who shall export oleomargarine shall brand upon every tub, firkin, or other package containing such article the word "oleomargarine," in plain Roman letters not less than one half inch square.

SEC. 17. That whenever any person engaged in carrying on the business of manufacturing oleomargarine defrauds, or attempts to defraud, the United States of the tax on the oleomargarine produced by him, or any part thereof, he shall forfeit the factory and manufacturing apparatus used by him, and all oleomargarine and all raw material for the production of oleomargarine found in the factory and on the factory premises, and shall be fined not less than \$500 nor more than \$5,000, and be imprisoned not less than six months nor more than three years.

SEC. 18. That if any manufacturer of oleomargarine, any dealer therein, or any importer or exporter thereof shall knowingly or willfully omit, neglect, or refuse to do or cause to be done any of the things required by law in the carrying on or conducting of his

business, or shall do anything by this act prohibited, if there be no specific penalty or punishment imposed by any other section of this act for the neglecting, omitting or refusing to do, or for the doing or causing to be done, the thing required or prohibited, he shall pay a penalty of \$1,000; and if the person so offending be the manufacturer of or a wholesale dealer in oleomargarine, all the oleomargarine owned by him, or in which he has any interest as owner, shall be forfeited to the United States.

Sec. 19. That all fines, penalties, and forfeitures imposed by this act may be recovered in any court of competent jurisdiction.

Sec. 20. That the Commissioner of Internal Revenue, with the approval of the Secretary of the Treasury, may make all needful regulations for carrying into effect of this act.

Sec. 21. That this act shall go into effect on the ninetieth day after its passage; and all wooden packages containing ten or more pounds of oleomargarine found on the premises of any dealer on or after the ninetieth day succeeding the date of the passage of this act shall be deemed to be taxable under section 8 of this act, and shall be taxed, and shall have affixed thereto the stamps, marks, and brands required by this act or by regulations made pursuant to this act; and for the purposes of securing the affixing of the stamps, marks, and brands required by this act, the oleomargarine shall be regarded as having been manufactured and sold, or removed from the manufactory for consumption or use, on or after the day this act takes effect; and such stock on hand at the time of the taking effect of this act may be stamped, marked, and branded under special regulations of the Commissioner of Internal Revenue, approved by the Secretary of the Treasury; and the Commissioner of Internal Revenue may authorize the holder of such package to mark and brand the same and to affix thereto the proper tax-paid stamps.

In the bill, as originally reported, the tax per pound on oleomargarine was fixed at 10 cents. An amendment reducing the sum to 8 cents was reported from the Committee of the Whole, and a motion to reduce the amount to 5 cents was finally carried—yeas 153, nays 122. A motion to make the tax 3 cents, failed by a vote of 130 to 140. An amendment proposed by Mr. Browne, of Indiana, exempting from the tax all oleomargerine purely made and sold undisguised, was defeated by a vote of 118 to 152. An amendment offered by Mr. Mills, of Texas, providing for an income-tax, was rejected by a vote of 83 to 188. Various amendments, intended to ridicule the bill, were offered—such as propositions to tax makers of glass eggs, incubators, and chickens hatched in them, shoes with paper in the soles, and all manner of fraudulent articles.

The vote in the House on the passage of the measure was as follows:

YEAS—G. E. Adams, C. H. Allen, J. M. Allen, J. A. Anderson, Atkinson, Baker, Ballentine, Barksdale, Barry, Bayne, Beach, Bingham, Bland, Bound, Bou-telle, Brady, C. E. Brown, W. W. Brown, Buchanan, Buck, Bunnell, Burleigh, Burrows, Butterworth, Bynum, Caldwell, J. E. Campbell, J. M. Campbell, Cannon, Carleton, Caswell, Clardy, Comstock, Conger, Davenport, Dawson, Dingley, Dockery, Dorsey, El-dredge, Ellsberry, Ely, Ermentrout, Evans, Everhart, Farquhar, Felton, Fleeger, Foran, Frederick, Fuller, Funston, Gallinger, Geddes, C. H. Gibson, Gilfillan, W. J. Green, Grout, Hale, Halsell, Hanbach, Hatch, Haynes, Heard, D. B. Henderson, T. J. Henderson, Henley, Hepburn, Hermann, Hil, Hires, Hiscock, Hitt, Holman, Holmes, Hopkins, Howard, Jackson,

James, F. A. Johnson, J. T. Johnston, Ketcham, King, Kleiner, La Follette, Landes, Le Fevre, Linds-ley, Little, Long, Lore, Loultit, Lowry, Lyman, Mat-son, McCornas, McCreary, McKenna, McKinley, Mil-lard, Milliken, Moffatt, Morgan, Morrill, Morrow, Muller, Murphy, Neece, Nelson, O'Donnell, O'Fer-rall, Osborne, Outhwaite, Parker, Payne, Payson, Perkins, Peters, Pettibone, Phelps, Pidcock, Pindar, Plumb, Price, Randall, Reese, Rice, Richardson, Riggs, Robertson, Rockwell, Romeis, Rowell, Ryan, Sawyer, Scott, Scranton, Seney, Sessions, Seymour, Shaw, Singleton, Smalls, Sowden, Spriggs, Springer, Stahlhecker, Steele, Stephenson, J. W. Stewart, E. F. Stone, W. J. Stone of Kentucky, Storm, Strait, Struble, Swope, Symes, E. B. Taylor, I. H. Taylor, J. R. Thomas, O. B. Thomas, Thompson, Townshend, Wade, Wait, Wakefield, T. B. Ward, A. J. Weaver, J. B. Weaver, Weber, West, A. C. White, Milo White, Whiting, Wilkins, Winans, Wolford, Worth-ington—177.

NAYS—J. J. Adams, Barbour, Barnes, Bennet, Blanchard, Blount, C. R. Breckinridge, W. C. P. Breckinridge, T. M. Browne, Burnes, Cabell, Felix Campbell, T. J. Campbell, Candler, Catchings, Cobb, Collins, Cowles, Cox, Crain, Crisp, Culberson, Curtin, Daniel, Dargan, A. C. Davidson, Dibble, Dough-erty, Dowdney, Dunham, Dunn, Fisher, Ford, Forney, Gay, Eustace Gibson, Glass, Hammond, Harris, Hemphill, J. S. Henderson, Herbert, Hewitt, Houk, Hutton, Irion, T. D. Johnston, J. H. Jones, J. T. Jones, Kelley, Lanham, Lawler, Lehlbach, Libbey, Lovering, Mahoney, Martin, Maybury, McAdoo, Mc-Millin, McRae, Merriman, Miller, Mills, Mitchell, Morrison, Neal, Negley, Norwood, Oates, O'Hara, Charles O'Neill, J. J. O'Neill, Peel, Perry, Reagan, Sayers, Skinner, Snyder, Spooner, St. Martin, Tarn-ney, Tabbee, J. M. Taylor, Zachary Taylor, Throck-morton, Tillman, Tucker, Turner, Van Eaton, Van Schaick, Wadsworth, Wallace, J. H. Ward, William Warner, Wellborn, Wheeler, Willis, Wilson, Wise, Woodburn—101.

Nor VOTING—Aiken, C. M. Anderson, Arnot, Bel-mont, Bliss, Boyle, Bragg, Brumm, Clements, Cole, Compton, Cooper, Croxton, Cutcheon, R. H. M. Da-vidson, Davis, Eden, Findlay, Glover, Goff, R. S. Green, Grosvenor, Guenther, Hall, Harmer, Hayden, Hiestand, Hudd, Lafoon, Laird, Markham, Owen, Pirce, Ranney, T. B. Reed, J. W. Reid, Rogers, Sad-ler, Charles Stewart, W. J. Stone of Missouri; Swin-burne, Trigg, Viele, A. J. Warner—45.

In the Senate, June 7, the bill was referred to the Committee on Agriculture and Forestry, though there was a sharp contest to have it referred to the Committee on Finance, as a revenue measure. On July 1 it was reported back without amendment by Senator Miller, of New York, who made the most elaborate argument in its favor. He acknowledged that the purpose of the bill was not to raise reve-nue, and based his advocacy of it on the follow-ing grounds:

“1. It is necessary in order to protect the whole people from fraud and imposition in having a counterfeit article sold to them for the genuine.

“2. It is necessary to protect the public health, for if it be admitted that oleo when made according to the process known as the Mége process is wholesome, yet I hold that the best of it, made as it is made to-day, is not as wholesome as butter, and that it may be the means of communicating disease to the human system.

“3. It is necessary to protect the chief farm-ing interest of this country, which is the dairy,

from unjust and fraudulent competition and consequent loss, if not absolute ruin.

"4. This legislation is necessary because the States have not been able thus far to either suppress or properly control the great evil of which I have spoken, and as sufficient remedy can be found nowhere, in my judgment, save under the Federal Government."

The argument in opposition to the bill was based mainly on the theory that, if it was not a revenue measure, there was no constitutional authority for passing it, and upon the fact that no new revenue bill was needed.

The measure was amended by making the tax per pound on oleomargarine provided for in Section 8, two cents instead of five. The vote on the adoption of this amendment was 33 yeas to 28 nays. Among the amendments proposed and rejected was one prepared by Senator Butler, of South Carolina, in the nature of the original bill, applying all of its provisions to the traffic in impure liquors.

The bill passed the Senate, on July 20, by the following vote:

YEAS—Aldrich, Allison, Blackburn, Blair, Camden, Cameron, Chace, Cockrell, Conger, Cullum, Dawes, Dolph, Edmunds, Evarts, Gorman, Hale, Harrison, Hawley, Hoar, Ingalls, Logan, McMillan, Mahone, Manderson, Miller, Mitchell of Oregon, Palmer, Payne, Platt, Plumb, Sawyer, Sewell, Sherman, Spooner, Stanford, Teller, Wilson of Iowa—37.

NAYS—Beck, Berry, Brown, Butler, Call, Coke, Colquitt, Eustis, Gibson, Gray, Hampton, Harris, Hearst, Jones of Arkansas, Maxey, Pugh, Ransom, Riddleberger, Vance, Vest, Voorhees, Walthall, Whithorne, Wilson of Maryland—24.

ABSENT—Bowen, Fair, Frye, George, Jones of Florida, Jones of Nevada, Kenna, McPherson, Mitchell of Pennsylvania, Morgan, Morrill, Pike, Sabin, Saulsbury, Van Wyck—15.

On July 23 the House concurred in the Senate amendments, and on August 2 the President approved of the measure.

Suspensions from Office.—One of the most important political incidents of the session was the controversy between the President and the Senate, over the right of that body to information on file in the departments in regard to suspensions from office. Issue was joined on the case of George M. Duskin, District Attorney of the Southern District of Alabama. The President suspended him from office July 17, 1885, and on the same day designated John D. Burnett to perform the duties of the office. December 14, 1885, the President nominated Burnett to be District Attorney of the Southern District of Alabama in place of Duskin, suspended. The nomination was referred to the Committee on the Judiciary of the Senate, and Feb. 18, 1886, the majority of the committee, through its chairman, Senator Edmunds, made a report in which the foregoing facts were first set forth. The report then went on to say:

Since the passage of the act of March 2, 1867, "regarding the tenure of certain civil offices," it has been the practice of the Committee on the Judiciary whenever a nomination has been made proposing the removal from office of one person and the appointment of another to address a note to the head of the de-

partment having such matters in charge (usually the Attorney-General), asking that all papers and information in the possession of the department touching the conduct and administration of the officer proposed to be removed and touching the character and conduct of the person proposed to be appointed be sent to the committee for its information. This practice has through all Administrations been carried on with the unanimous approval of all the members of the committee, although the composition of the committee has been during this period sometimes of one political character and sometimes of another. In no instance, until this time, has the committee met with any delay or denial in respect of furnishing such papers and information, with a single exception, and in which exception the delay and suggested denial lasted for only two or three days.

The committee has thus hitherto been enabled to know the character and quality of the administration of the office in charge of the incumbent proposed to be removed as well as the character and quality of the person proposed to be appointed, so far as the papers in the department could furnish information in regard thereto.

In the instance now particularly under consideration the committee, according to its standing course, on Dec. 26, 1885, through its chairman, addressed a note to the Attorney-General in the same form and asking for the same papers and information that it had been accustomed to do. After sundry delays and explanations it became evident to the committee that it could not by this informal method obtain an inspection of the papers and documents in the Department of Justice bearing upon the subject. It accordingly, on the 25th of January, 1886, reported to the Senate for its adoption a resolution in the following words:

"Resolved, That the Attorney-General of the United States be and he hereby is directed to transmit to the Senate copies of all documents and papers that have been filed in the Department of Justice since the 1st day of January, A. D. 1885, in relation to the management and conduct of the office of District Attorney of the United States of the Southern District of Alabama," which on the next day was adopted by the Senate without a division.

The Attorney-General, on the 1st day of February, 1886, sent to the Senate a communication in the following words:

DEPARTMENT OF JUSTICE, January 28, 1886.
The PRESIDENT pro tempore of the Senate of the United States:

I acknowledge the receipt of a resolution of the Senate, adopted on the 25th instant in executive session, as follows:

"Resolved, That the Attorney-General of the United States be and he hereby is directed to transmit to the Senate copies of all documents and papers that have been filed in the Department of Justice since the 1st day of January, A. D. 1885, in relation to the management and conduct of the office of District Attorney of the United States of the Southern District of Alabama."

In response to the said resolution the President of the United States directs me to say that the papers which were in this department relating to the fitness of John D. Burnett, recently nominated to said office, having been already sent to the Judiciary Committee of the Senate, and the papers and documents which are mentioned in the said resolution and still remaining in the custody of this department, having exclusive reference to the suspension by the President of George M. Duskin, the late incumbent of the office of District Attorney of the United States for the Southern District of Alabama, it is not considered that the public interest will be promoted by a compliance with said resolution and the transmission of the papers and documents therein mentioned to the Senate in executive session.

Very respectfully, your obedient servant,
A. H. GARLAND, Attorney-General.

This letter, although in response to the direction of the Senate that copies of any papers bearing on the subject within a given period of time be transmitted, assumes that the Attorney-General of the United States is the servant of the President, and is to give or withhold copies of documents in his office according to the will of the Executive and not otherwise.

Your committee is unable to discover, either in the original act of 1789 creating the office of Attorney-General or in the act of 1870 creating the department of Justice, any provision which makes the Attorney-General of the United States in any sense the servant of or controlled by the Executive in the performance of the duties imputed to him by law or the nature of his office. It is true that in the creation of the Department of State, of War, and of the Navy, it was provided in substance that these Secretaries should perform such duties as should from time to time be enjoined upon them by the President, and should conduct the business of their departments in such manner as the President should direct, but the committee does not think it important to the main question under consideration that such direction is not to be found in the statute creating the Department of Justice, for it is thought it must be obvious that the authority intrusted by the statute in these cases to the President to direct and control the performance of duties was only a superintending authority to regulate the performance of the duties that the law required, and not to require the performance of duties that the laws had not devolved upon the heads of departments, and not to dispense with or forbid the performance of such duties according as it might suit the discretion or the fancy of the Executive. The Executive is bound by the Constitution and by his oath to take care that the laws be faithfully executed, and he is himself as much bound by the regulations of law as the humblest officer in the service of the United States, and he can not have authority to undertake to faithfully execute the laws, whether applied to his own special functions or those of the departments created by law, otherwise than by causing, so far as he lawfully may and by lawful methods, the heads of departments and other officers of the United States to do the duties which the law, and not his will, has imputed to them.

The important question, then, is whether it is within the constitutional competence of either House of Congress to have access to the official papers and documents in the various public offices of the United States created by laws enacted by themselves. It may be fully admitted that, except in respect of the Department of the Treasury, there is no statute which commands the head of any department to transmit to either House of Congress on its demand any information whatever concerning the administration of his department; but the committee believes it to be clear that from the very nature of the powers intrusted by the Constitution to the two Houses of Congress it is a necessary incident that either House must have at all times the right to know all that officially exists or takes place in any of the departments of the Government. So perfectly was this proposition understood before and at the time of the formation of the Constitution, that the Continental Congress, before the adoption of the present Constitution, in establishing a department of foreign affairs, and providing for a principal officer thereof, thought it fit to enact that all books, records, and other papers in that office should be open to the inspection of any member of Congress, provided that no copy should be taken of matters of secret nature without special leave of Congress. It was not thought necessary to enact that the Congress itself should be entitled to the production and inspection of such papers, for that right was supposed to exist in the very nature of things; and when under the Constitution the department came to be created, although the provision that each individual member of Congress should have access to the papers was omitted (evidently for reasons that can now be quite

well understood) it was not thought necessary that an affirmative provision should be inserted giving to the Houses of Congress the right to know the contents of the public papers and records in the public offices of the country whose laws and whose offices they were to assist in creating.

It is believed that there is no instance of civilized governments having bodies representative of the people or of states in which the right and the power of those representative bodies to obtain in one form or another complete information as to every paper and transaction in any of the executive departments thereof does not exist, even though such papers might relate to what is ordinarily an executive function, if that function impinged upon any duty or function of the representative bodies. A qualification of this general right may, under our Constitution, exist in the case of calls by the House of Representatives for papers relating to treaties, etc., under consideration and not yet disposed of by the President and Senate.

The committee feels authorized to state, after a somewhat careful research, that within the foregoing limits there is scarcely in the history of this Government until now any instance of a refusal by a head of a department, or even of the President himself, to communicate official facts and information as distinguished from private and unofficial papers, motions, views, reasons, and opinions, to either House of Congress when unconditionally demanded. Indeed, the early Journals of the Senate show great numbers of instances of directions to the heads of departments, as, of course, to furnish papers and reports upon all sorts of affairs both legislative and executive.

The instances of requests to the President and commands to the heads of departments by each House of Congress from those days until now, for papers and information on every conceivable subject of public affairs, are almost innumerable; for it appears to have been thought by all the Presidents who have carried on the Government now for almost a century that even in respect of requests to them, an independent and co-ordinate branch of the Government, they were under a constitutional duty and obligation to furnish to either House the papers called for, unless, as has happened in very rare instances, when the request was coupled with an appeal to the discretion of the President in respect of the danger of publicity to send the papers if, in his judgment, it should not be incompatible with the public welfare.

The report, after giving a number of these precedents, proceeded as follows:

But it would seem to be needless to array further precedents out of the vast mass that exists in the Journals of the Houses covering probably every year of the existence of the Government. The practical construction of the Constitution in these respects by all branches of the Government for so long a period would seem upon acknowledged principles to settle what are the rights and powers of the two Houses of Congress in the exercise of their respective duties covering every branch of the operations of the Government, and it is submitted with confidence that such rights and powers are indispensable to the discharge of their duties and do not infringe any right of the Executive, and that it does not belong to either heads of departments or to the President himself to take into consideration any supposed motives or purposes that either House may have in calling for such papers, or whether their possession or knowledge of their contents could be applied by either House to useful purposes.

The Constitution of the United States was adopted in the light of the well-known history that even ministers of the English Crown were bound to lay before Parliament all papers when demanded on pain of the instant dismissal of such ministers on refusal, through the rapid and effectual instrumentalities of a vote of want of confidence. And the Continental Congress had for more than ten years itself governed the coun-

try, and had control of all papers and records, not by reason of anything expressed in the Articles of Confederation, but by reason of the intrinsic nature of free government. The jurisdiction of the two Houses of Congress to legislate and the power to advise or withhold advice concerning treaties and appointments necessarily involves the jurisdiction to officially know every step and action of the officers of the law, and all the facts touching their conduct in the possession of any department or even in the possession of the President himself. There was no need to express such a power, for it was necessarily an inherent incident to the exercise of the powers granted.

It will be observed that in this instance the call for papers covered a period of more than six months, during which the regular incumbent of the office had been discharging its duties, and also the further period of more than six months, during which the person designated to discharge those duties on suspension of the officer had been acting, and that that person is the one now proposed to be appointed to the place.

It will also be observed that the President has not undertaken to remove the incumbent of the office, but has only, in expressed and stated pursuance of the statutes on the subject, suspended that officer, and that the same statutes expressly provide that such officer shall not be removed without the advice and consent of the Senate, and that, if that advice and consent be not given, the incumbent would (unless his regular term of office should have previously expired) at the close of this session of the Senate be restored to the lawful right to exercise its duties. The Senate, then, by this nomination is asked to advise and consent to the removal of the incumbent and to the appointment of the candidate proposed for his place. In exercising its duty in respect of these questions it is plain that the conduct and management of the incumbent is a matter absolutely essential to be known to the Senate, in order that it may determine whether it can rightly advise his removal or rightly leave him to resume the functions of his office at the end of its session, as well as whether the candidate proposed has in the exercise of the office under his designation so conducted himself as to show that he is competent and faithful. Indeed, it may be stated with entire accuracy that even in the case of a vacancy in an office and the proposed filling of such vacancy it is important for the Senate to know the previous condition and management of the office, the state of its affairs; whether there have been cases of misconduct or abuse of powers, the embezzlement of money, and indeed all the circumstances bearing upon its administration, in order that it may judge of the suitability of appointing a particular person to take up its duties with reference to the difficulties that may exist in its affairs, the state of the accounts, and everything concerning its administration, so as to measure the fitness and competency of the particular candidate to meet the emergencies of the case.

It appears from the table herewith submitted that out of about fourteen hundred and eighty-five nominations sent to the Senate during the first thirty days of this session, that is, from the first Monday in December, 1885, to the 5th of January, 1886, six hundred and forty-three were nominations of persons proposed to be appointed in the place of officers suspended and proposed to be removed (and of whom it is known that some are soldiers), and in respect of whom the action of the Senate in advising and consenting to the proposed appointment would effect a removal and in respect of whom the failure of the Senate to advise and consent to such removals and appointments the effect would be to restore them to the possession of their offices at the end of the session, except in cases in which the terms of some of them should have previously expired.

Is it not desirable and necessary to the proper performance of its duties and in every aspect of the public interest that the simple facts in regard to what the conduct of these officials as well as in regard to what

the conduct of the persons designated to perform their duties has been should be made known to the Senate? Have these suspended officials, or any considerable number of them, been guilty of misconduct in office, or of any personal conduct making them unworthy to be longer trusted with the performance of duties imposed upon them by law? If they have, it would seem to be clear that every consideration of public interest and of public duty would require that the facts should be made known, in order that the Senate may understandingly and promptly advise their removal, and that the most careful scrutiny should be had in respect of selecting their successors, as well as in respect of providing better means and safeguards by legislation for administering the laws of the United States.

Such information, it would seem, the Executive is determined the Senate shall not possess, for the alleged reason that it might enable the Senate to understand what circumstances connected with the faithful execution of the laws induced the President to exercise the discretion the statute confers upon him to suspend them and ask the Senate to unite with him in their removal from office. A similar result would follow in respect of the knowledge of any and every step in the transactions of the Government; for instance, the President, as Commander-in-Chief of the Army, has as large discretion as he has in the suspension of civil officers, but on the theory suggested by the Attorney-General both the President and the Secretary of War would be justified in refusing to either House of Congress copies of papers and documents relating to the administration of the Department of War and the disposition of the troops, etc., for the reason that, the facts being disclosed, the two Houses of Congress might be enabled to comprehend the reasons and motives actuating the Executive in his conduct as Commander-in-Chief.

Reduced to its simplest form the proposition would be that neither the President nor the head of a department is bound to communicate any official papers to either House of Congress which might draw into question in the minds of its members or of the people the wisdom or fairness of his acts. But the committee is of the opinion that in matters of this nature the Senate has little concern with the reasons or motives either of the heads of departments or of the Executive, but it has large concern that its own reasons and grounds of action should rest upon and be drawn from the solid truth. The Senate, if it does its duty and preserves the independence that belongs to it, must act upon its own reasons and judgment and not upon those of the President, however valuable they may be. If the truth regarding the conduct of these officials and designated persons were known, the question for the Senate would be not what were the reasons or motives of the Executive, but whether the facts themselves, as they took place, would furnish it with sufficient reason for giving or withholding its advice and consent to the proposed changes.

The report then quoted at length the passage in the President's message in regard to civil-service reform, and said that the declarations made therein give special importance to the facts relating to suspensions from office:

This highly important and valuable official communication in the presence of six hundred and forty-three suspensions from office would seem to lead to the conclusion that this number of the civil officers of the United States selected to be suspended and removed had been so derelict in the performance of their functions or guilty of such personal misconduct as to put them in the category of unfaithful public servants deserving dismissal by the President and the Senate and the condemnation of their countrymen. In such a state of things we think that the common sense of justice and fair play that is so much prized, as we believe, by the people of the United

States would require that in some way this large body of men should have an opportunity to know the substance of their alleged misdoings in order that they may either admit their guilt, or, denying it, explain their conduct, or show that the accusations against them were selfish and wicked pretexts, and set up for the mere purpose of obtaining their suspension and ultimate dismissal from office in order that others less capable and worthy might at once receive the honors and emoluments of their places. It is known to every Senator that, so far as the Senate has had to do both with removals and appointments, it has for a great number of years been its practice, when any officer or person was before it for removal or appointment, against whom any serious accusation has been made which would, if true, influence the action of the Senate in the case, to cause the person concerned to be informed of the substance of the complaint against him, and give him an opportunity to defend himself; and it is also known that at this very session a very considerable number of instances of that kind have occurred and are daily occurring. If the Senate is proceeding upon a false principle in such instances, it is high time that its course in these respects should be reversed, and that hereafter it should act upon such accusations without any knowledge other than that derived from the accusers, and leave the victims of such injustice to console themselves with the reflection that all parties are now engaged in an effort to reform the Government.

Why should the facts, as they may appear from the papers on file, be suppressed? Is it because that, being brought to light, it would appear that malice and misrepresentation and perjury are somewhat abundant, or merely that faithful and competent and honorable officers have been suspended and are proposed to be removed, under the advice and consent of the Senate, in order that places may be found for party men because they are party men or are the special objects of party favor?

How does it happen in this time of suggested reform and purer methods in government that for the first time it is thought important that the historic and administrative facts relating to the official and personal conduct of officers of the United States should be withheld, and that the administration of the Government should proceed with a secrecy and mystery as great as in the days of the Star Chamber?

The high respect and consideration that the Senate must always have for the executive office would make it reluctant to adopt either theory. But at present the impenetrable veil remains, and as the committee is unable to suggest any other solution of the riddle, it must leave it until this veil is lifted and the operations of the Government shall again be known.

The report closed with the submission of the following resolutions:

Resolved, That the foregoing report of the Committee on the Judiciary be agreed to and adopted.

Resolved, That the Senate hereby expresses its condemnation of the refusal of the Attorney-General, under whatever influence, to send to the Senate copies of papers called for by its resolution of the 25th of January and set forth in the report of the Committee on the Judiciary as in violation of his official duty and subversive of the fundamental principles of the Government and of a good administration thereof.

Resolved, That it is, under these circumstances, the duty of the Senate to refuse its advice and consent to proposed removals of officers, the documents and papers in reference to the supposed official or personal misconduct of whom are withheld by the Executive or any head of a department when deemed necessary by the Senate and called for in considering the matter.

Resolved, That the provision of section 1754 of the Revised Statutes declaring that persons honorably discharged from the military or naval service by reason of disability resulting from wounds or sickness incurred in the line of duty shall be preferred for

appointments to civil offices, provided they are found to possess the business capacity necessary for the proper discharge of the duties of such office, ought to be faithfully and fully put in execution, and that to remove, or to propose to remove, any such soldier whose faithfulness, competency, and character are above reproach and to give place to another who has not rendered such service, is a violation of the spirit of the law and of the practical gratitude the people and Government of the United States owe to the defenders of constitutional liberty and the integrity of the Government.

Feb. 23, Mr. Morgan, of Alabama, submitted the following resolutions touching the report of the Committee on the Judiciary:

Whereas, A majority of the Committee on the Judiciary have originated and reported to the Senate and recommend the adoption of the following resolution:

"Resolved, That the Senate hereby expresses its condemnation of the refusal of the Attorney-General, under whatever influence, to send to the Senate copies of papers called for by its resolution of the 25th of January and set forth in the report of the Committee on the Judiciary as in violation of his official duty and subversive of the fundamental principles of the Government and of a good administration thereof"; and

Whereas, The Senate, if said resolution is adopted as being true upon the facts and as matter of law, will thereby announce the prejudgment of a majority of this body, without any trial according to law, that the Attorney-General of the United States is guilty of and condemned for having willfully committed an offense in the conduct of his office which is in violation of his official duty and is subversive of the fundamental principles of the Government of the United States; and

Whereas, The Attorney-General, if he has in fact willfully committed any offense that is in violation of his official duty and is subversive of the fundamental principles of the Government of the United States, is only amenable to the condemnation of the Senate when the Senate is sitting, with the Chief Justice of the United States, as a court of impeachment to hear and decide upon articles of impeachment presented by the House of Representatives; and

Whereas, It is alleged that the Senate has no rightful authority to cause the Attorney-General of the United States to be arrested, tried, and punished for a contempt of its authority and dignity, if the Senate shall declare that such contempt has been committed by him upon the facts stated and the averments made in said resolution and in the report which accompanies the same; and

Whereas, The Senate would be exposed to just censure if they, in the manner recommended by the Committee on the Judiciary, proceed to announce their judgment of condemnation against the Attorney-General of the United States upon an accusation that includes an offense which is punishable by impeachment; and

Whereas, The Senate would also be exposed to just censure if it should attempt to declare the Attorney-General to be in contempt of its authority, and to pass judgment of condemnation against him for such contempt without having him notified of the charge and arraigned to answer the same at the bar of the Senate;

Resolved, That the Committee on Privileges and Elections be instructed to inquire into and report upon the question whether the offense alleged against the Attorney-General of the United States in said resolution is of the class of offenses for which the head of a department may be impeached and removed from office, and whether the Senate can take jurisdiction of said alleged offense in the manner provided for in said resolution, and can proceed to convict and condemn the Attorney-General in advance

of a trial for said alleged offense by a resolution or the Senate, there being no impeachment of said officer in the mode required by the Constitution.

2. That said committee be instructed to further inquire and report whether the Senate has the power under the law and the rules adopted for its government to arrest, try, convict, and punish the Attorney-General of the United States for a contempt of its rightful authority.

3. That said committee be further instructed to inquire and report whether the matters stated and referred to in the manner set forth in the resolution reported from the Committee on the Judiciary above copied constitute any crime or any misdemeanor in office under any law of the United States; and, if so, what penalty is annexed to said crime or misdemeanor, and what tribunal has the rightful jurisdiction to try and, on conviction, to condemn the Attorney-General of the United States to punishment for the same.

4. That said committee be further instructed to consider, ascertain, and report whether in the conduct of the Attorney-General, as stated in the resolution reported from the Committee on the Judiciary and in the accompanying report, he violated any and what law of the United States, and in what respect he has violated said law; and whether he has done any and what act, in his conduct of the business of his office to which said resolution relates, that he might not have done in the exercise of his lawful discretion.

5. That said committee be further instructed to inquire and report whether the Senate has any constitutional right or power to give its advice and consent to removals from office by the President, and whether, by withholding such advice and consent, the Senate can prevent the removal of any person from office by the President.

6. That said committee inquire and report whether the Senate, if a majority shall agree to the resolution above recited (which was reported from the Committee on the Judiciary), has the right, under the Constitution, to withhold its consent to the removal of persons by the President who are unfit for office, under the circumstances mentioned in said report of the Committee on the Judiciary and in the resolutions reported by said committee; and whether the Senate can bind its members by any declaration of the duty of the Senate, or by any rule, as a duty to the Senate, as the same is declared in the following resolution touching the powers and proper conduct of the Senate, which was also reported by the Committee on the Judiciary, namely:

"Resolved, That it is, under these circumstances, the duty of the Senate to refuse its advice and consent to proposed removals of officers the documents and papers in reference to the supposed official or personal misconduct of whom are withheld by the Executive or any head of a department when deemed necessary by the Senate and called for in considering the matter."

March 1, the President sent to the Senate the following message on the relations of that body to the executive departments:

To the Senate of the United States:

Ever since the beginning of the present session of the Senate the different heads of the departments attached to the executive branch of the Government have been plied with various requests and demands from committees of the Senate, from members of such committees, and at last from the Senate itself, requiring the transmission of reasons for the suspension of certain officials during the recess of that body, or for the papers touching the conduct of such officials, or for all papers and documents relating to such suspensions, or for all documents and papers filed in such departments in relation to the management and conduct of the offices held by such suspended officials.

The different terms from time to time adopted in

making these requests and demands, the order in which they succeeded each other, and the fact that when made by the Senate the resolution for that purpose was passed in executive session, have led to a presumption, the correctness of which will, I suppose, be candidly admitted, that from first to last the information thus sought and the papers thus demanded were desired for use by the Senate and its committees in considering the propriety of the suspensions referred to.

Though these suspensions are my executive acts, based upon considerations addressed to me alone, and for which I am wholly responsible, I have had no invitation from the Senate to state the position which I have felt constrained to assume in relation to the same, or to interpret for myself my acts and motives in the premises.

In this condition of affairs I have forbore addressing the Senate upon the subject, lest I might be accused of thrusting myself unbidden upon the attention of that body.

But the report of the Committee on the Judiciary of the Senate, lately presented and published, which censures the Attorney-General of the United States for his refusal to transmit certain papers relating to a suspension from office, and which also, if I correctly interpret it, evinces a misapprehension of the position of the Executive upon the question of such suspensions, will, I hope, justify this communication.

This report is predicated upon a resolution of the Senate directed to the Attorney-General and his reply to the same. This resolution was adopted in executive session, devoted entirely to business connected with the consideration of nominations for office. It required the Attorney-General "to transmit to the Senate copies of all documents and papers that have been filed in the Department of Justice since the 1st day of January, 1855, in relation to the management and conduct of the office of District Attorney of the United States of the Southern District of Alabama."

The incumbent of this office on the 1st day of January, 1855, and until the 17th day of July ensuing, was George M. Duskin, who, on the day last mentioned, was suspended by an executive order, and John D. Burnett designated to perform the duties of said office. At the time of the passage of the resolution above referred to, the nomination of Burnett for said office was pending before the Senate, and all the papers relating to said nomination were before that body for its inspection and information.

In reply to this resolution the Attorney-General, after referring to the fact that the papers relating to the nomination of Burnett had already been sent to the Senate, stated that he was directed by the President to say that "the papers and documents which are mentioned in said resolution and still remaining in the custody of this department, having exclusive reference to the suspension by the President of George M. Duskin, the late incumbent of the office of District Attorney for the Southern District of Alabama, it is not considered that the public interests will be promoted by a compliance with said resolution and the transmission of the papers and documents therein mentioned to the Senate in executive session."

Upon this resolution and the answer thereto the issue is thus stated by the Committee on the Judiciary at the outset of the report:

"The important question, then, is whether it is within the constitutional competence of either House of Congress to have access to the official papers and documents in the various public offices of the United States created by laws enacted by themselves."

I do not suppose that "the public offices of the United States" are regulated or controlled in their relations to either House of Congress by the fact that they were "created by laws enacted by themselves." It must be that these instrumentalities were created for the benefit of the people and to answer the general purposes of government under the Constitution and the laws, and that they are unencumbered by any lien

in favor of either branch of Congress growing out of their construction, and unembarrassed by any obligation to the Senate as the price of their creation.

The complaint of the committee, that access to official papers in the public offices is denied the Senate, is met by the statement that at no time has it been the disposition or the intention of the President or any department of the executive branch of the Government to withhold from the Senate official documents or papers filed in any of the public offices. While it is by no means conceded that the Senate has the right in any case to review the act of the Executive in removing or suspending a public officer upon official documents or otherwise, it is considered that documents and papers of that nature should, because they are official, be freely transmitted to the Senate upon its demand, trusting the use of the same for proper and legitimate purposes to the good faith of that body. And though no such paper or document has been specifically demanded in any of the numerous requests and demands made upon the departments, yet as often as they were found in the public offices they have been furnished in answer to such applications.

The letter of the Attorney-General in response to the resolution of the Senate in the particular case mentioned in the committee's report was written at my suggestion and by my direction. There had been no official papers or documents filed in his department relating to the case within the period specified in the resolution. The letter was intended, by its description of the papers and documents remaining in the custody of the department, to convey the idea that they were not official; and it was assumed that the resolution called for information, papers, and documents of the same character as were required by the requests and demands which preceded it.

Everything that had been written or done on behalf of the Senate from the beginning pointed to all letters and papers of a private and unofficial nature as the objects of search, if they were to be found in the departments, and provided they had been presented to the Executive with a view to their consideration upon the question of suspension from office.

Against the transmission of such papers and documents I have interposed my advice and direction. This has not been done, as is suggested in the committee's report, upon the assumption on my part that the Attorney-General or any other head of a department "is the servant of the President, and is to give or withhold copies of documents in his office according to the will of the Executive and not otherwise," but because I regard the papers and documents withheld and addressed to me, or intended for my use and action, purely unofficial and private, not infrequently confidential, and having reference to the performance of a duty exclusively mine. I consider them in no proper sense as upon the files of the department, but as deposited there for my convenience, remaining still completely under my control. I suppose if I desired to take them into my custody I might do so with entire propriety, and if I saw fit to destroy them no one could complain.

Even the committee in its report appears to concede that there may be with the President, or in the departments, papers and documents which, on account of their unofficial character, are not subject to the inspection of the Congress. A reference in the report to instances where the House of Representatives ought not to succeed in a call for the production of papers is immediately followed by this statement:

"The committee feels authorized to state, after a somewhat careful research, that within the foregoing limits there is scarcely in the history of this Government, until now, any instance of a refusal by a head of a department, or even of the President himself, to communicate official facts and information as distinguished from private and unofficial papers, motions, views, reasons, and opinions to either House of Congress when unconditionally demanded."

To which of the classes thus recognized do the papers and documents belong that are now the objects of the Senate's quest?

They consist of letters and representations addressed to the Executive or intended for his inspection; they are voluntarily written and presented by private citizens who are not in the least instigated thereto by any official invitation or at all subject to official control. While some of them are entitled to executive consideration, many of them are so irrelevant, or, in the light of other facts, so worthless, that they have not been given the least weight in determining the question to which they are supposed to relate.

Are all these, simply because they are preserved, to be considered official documents and subject to the inspection of the Senate? If not, who is to determine which belong to this class? Are the motives and purposes of the Senate, as they are day by day developed, such as would be satisfied with my selection? Am I to submit to theirs at the risk of being charged with making a suspension from office upon evidence which was not even considered?

Are these papers to be regarded official because they have not only been presented but preserved in the public offices?

Their nature and character remain the same whether they are kept in the Executive Mansion or deposited in the departments. There is no mysterious power of transmutation in departmental custody, nor is there magic in the undefined and sacred solemnity of department files. If the presence of these papers in the public offices is a stumbling-block in the way of the performance of senatorial duty, it can be easily removed.

The papers and documents which have been described derive no official character from any constitutional, statutory, or other requirement making them necessary to the performance of the official duty of the Executive.

It will not be denied, I suppose, that the President may suspend a public officer in the entire absence of any papers or documents to aid his official judgment and discretion. And I am quite prepared to avow that the cases are not few in which suspensions from office have depended more upon oral representations made to me by citizens of known good repute, and by members of the House of Representatives and Senators of the United States, than upon any letters and documents presented for my examination. I have not felt justified in suspecting the veracity, integrity, and patriotism of Senators, or ignoring their representations, because they were not in party affiliation with the majority of their associates; and I recall a few suspensions which bear the approval of individual members identified politically with the majority in the Senate.

While, therefore, I am constrained to deny the right of the Senate to the papers and documents described, so far as the right to the same is based upon the claim that they are in any view of the subject official, I am also led unequivocally to dispute the right of the Senate, by the aid of any documents whatever, or in any way save through the judicial process of trial on impeachment to review or reverse the acts of the Executive in the suspension, during the recess of the Senate, of Federal officials.

I believe the power to remove or suspend such officials is vested in the President alone by the Constitution, which in express terms provides that "the executive power shall be vested in a President of the United States of America," and that "he shall take care that the laws be faithfully executed."

The Senate belongs to the legislative branch of the Government. When the Constitution by express provision superadded to its legislative duties the right to advise and consent to appointments to office and to sit as a court of impeachment, it conferred upon that body all the control and regulation of executive action supposed to be necessary for the safety of the

people; and this express and special grant of such extraordinary powers, not in any way related to or growing out of general senatorial duty, and in itself a departure from the general plan of our Government, should be held, under a familiar maxim of construction, to exclude every other right of interference with executive functions.

In the first Congress which assembled after the adoption of the Constitution, comprising many who aided in its preparation, a legislative construction was given to that instrument in which the independence of the Executive in the matter of removals from office was fully sustained.

I think it will be found that in the subsequent discussions of this question there was generally, if not at all times, a proposition pending to in some way curtail this power of the President by legislation, which furnishes evidence that to limit such power it was supposed to be necessary to supplement the Constitution by such legislation.

The first enactment of this description was passed under a stress of partisanship and political bitterness which culminated in the President's impeachment.

This law provided that the Federal officers to which it applied could only be suspended during the recess of the Senate when shown by evidence satisfactory to the President to be guilty of misconduct in office, or crime, or when incapable or disqualified to perform their duties, and that within twenty days after the next meeting of the Senate it should be the duty of the President "to report to the Senate such suspension, with the evidence and reasons for his action in the case."

This statute passed in 1867 when Congress was overwhelmingly and bitterly opposed politically to the President, may be regarded as an indication that even then it was thought necessary by a Congress determined upon the subjugation of the Executive to legislative will to furnish itself a law for that purpose, instead of attempting to reach the object intended by an invocation of any pretended constitutional right.

The law which thus found its way to our statute-book was plain in its terms, and its intent needed no avowal. If valid and now in operation it would justify the present course of the Senate and command the obedience of the Executive to its demands. It may, however, be remarked in passing that, under this law the President had the privilege of presenting to the body which assumed to review his executive acts his reasons therefor, instead of being excluded from explanation or judged by papers found in the departments.

Two years after the law of 1867 was passed, and within less than five weeks after the inauguration of a President in political accord with both branches of Congress, the sections of the act regulating suspensions from office during the recess of the Senate were entirely repealed, and in their place were substituted provisions which, instead of limiting the causes of suspension to misconduct, crime, disability, or disqualification, expressly permitted such suspension by the President "in his discretion," and completely abandoned the requirement obliging him to report to the Senate "the evidence and reasons" for his action.

With these modifications and with all branches of the Government in political harmony, and in the absence of partisan incentive to captious obstruction, the law as it was left by the amendment of 1869 was much less destructive of executive discretion. And yet the great general and patriotic citizen who on the 4th day of March, 1869, assumed the duties of Chief Executive, and for whose freer administration of his high office the most hateful restraints of the law of 1867 were on the 5th day of April, 1869, removed, mindful of his obligation to defend and protect every prerogative of his great trust, and apprehensive of the injury threatened the public service in the continued operation of these statutes even in their modified form, in his first message to Congress advised their repeal, and

set forth their unconstitutional character and hurtful tendency in the following language:

"It may be well to mention here the embarrassment possible to arise from leaving on the statute-books the so-called 'tenure-of-office acts' and to earnestly recommend their total repeal. It could not have been the intention of the framers of the Constitution, when providing that appointments made by the President should receive the consent of the Senate, that the latter should have the power to retain in office persons placed there by Federal appointment against the will of the President. The law is inconsistent with a faithful and efficient administration of the Government. What faith can an Executive put in officials forced upon him, and those, too, whom he has suspended for reason? How will such officials be likely to serve an Administration which they know do not trust them?"

I am unable to state whether or not this recommendation for a repeal of these laws has been since repeated. If it has not, the reason can probably be found in the experience which demonstrated the fact that the necessities of the political situation but rarely developed their vicious character.

And so it happens that after an existence of nearly twenty years of almost innocuous desuetude these laws are brought forth—apparently the repealed as well as the unrepealed—and put in the way of an Executive who is willing, if permitted, to attempt an improvement in the methods of administration.

The constitutionality of these laws is by no means admitted. But why should the provisions of the repealed law, which required specific cause for suspension and a report to the Senate of "evidence and reasons," be now, in effect, applied to the present Executive, instead of the law, afterward passed and unrepealed, which distinctly permits suspensions by the President "in his discretion," and carefully omits the requirement that "evidence and reasons for his action in the case" shall be reported to the Senate.

The requests and demands which by the score have for nearly three months been presented to the different departments of the Government whatever may be their form, have but one complexion. They assume the right of the Senate to sit in judgment upon the exercise of my exclusive discretion and executive function, for which I am solely responsible to the people from whom I have so lately received the sacred trust of office. My oath to support and defend the Constitution, my duty to the people who have chosen me to execute the powers of their great office and not to relinquish them, and my duty to the chief magistracy, which I must preserve unimpaired in all its dignity and vigor, compel me to refuse compliance with these demands.

To the end that the service may be improved, the Senate is invited to the fullest scrutiny of the persons submitted to them for public office, in recognition of the constitutional power of that body to advise and consent to their appointment. I shall continue, as I have thus far done, to furnish, at the request of the confirming body, all the information I possess touching the fitness of the nominees placed before them for their action, both when they are proposed to fill vacancies and to take the place of suspended officials. Upon a refusal to confirm I shall not assume the right to ask the reasons for the action of the Senate nor question its determination. I can not think that anything more is required to secure worthy incumbents in public office than a careful and independent discharge of our respective duties within their well-defined limits.

Though the propriety of suspensions might be better assured if the action of the President was subject to review by the Senate, yet if the Constitution and the laws have placed this responsibility upon the executive branch of the Government, it should not be divided nor the discretion which it involves relinquished.

It has been claimed that the present Executive, hav-

ing pledged himself not to remove officials except for cause, the fact of their suspension implies such misconduct on the part of a suspended official as injures his character and reputation, and therefore the Senate should review the case for his vindication.

I have said that certain officials should not, in my opinion, be removed during the continuance of the term for which they were appointed solely for the purpose of putting in their place those in political affiliation with the appointing power, and this declaration was immediately followed by a description of official partisanship which ought not to entitle those in whom it was exhibited to consideration. It is not apparent how an adherence to the course thus announced carries with it the consequences described. If in any degree the suggestion is worthy of consideration, it is to be hoped that there may be a defense against unjust suspension in the justice of the Executive.

Every pledge which I have made by which I have placed a limitation upon my exercise of executive power has been faithfully redeemed. Of course the pretense is not put forth that no mistakes have been committed; but not a suspension has been made except it appeared to my satisfaction that the public welfare would be improved thereby. Many applications for suspension have been denied, and the adherence to the rule laid down to govern my actions as to such suspensions has caused much irritation and impatience on the part of those who have insisted upon more changes in the offices.

The pledges I have made were made to the people, and to them I am responsible for the manner in which they have been redeemed. I am not responsible to the Senate, and I am unwilling to submit my actions and official conduct to them for judgment.

There are no grounds for an allegation that the fear of being found false to my professions influences me in declining to submit to the demands of the Senate. I have not constantly refused to suspend officials, and thus incurred the displeasure of political friends, and yet willfully broken faith with the people for the sake of being false to them.

Neither the discontent of party friends nor the allurements constantly offered of confirmations of appointees conditioned upon the avowal that suspensions have been made on party grounds alone, nor the threat proposed in the resolutions now before the Senate that no confirmations will be made unless the demands of that body be complied with, are sufficient to discourage or deter me from following in the way which I am convinced leads to better government for the people.

GROVER CLEVELAND.

EXECUTIVE MANSION,

WASHINGTON, D. C., March 1, 1886.

March 1, the minority of the Committee on the Judiciary, through Mr. Pugh, of Alabama, presented a report, in the course of which it is said :

The right of the Senate or House to papers and documents in the keeping of the President or the heads of departments must be decided by their contents and character and the use that can be made of them in the exercise of any power or jurisdiction intrusted to either house by the Constitution in executive or legislative session. If the papers and documents can instruct or aid either house in the exercise of legislative or executive powers or privileges intrusted to them by the Constitution, the right of either house to the possession of such papers or documents or their contents has never been questioned. It is impossible, in the judgment of the minority, for the majority or for the Senate to find the slightest support, excuse, or justification for their claim to the papers and documents relating exclusively to suspensions by the President, except on the ground that the Senate has the same power under the Constitution of advising and consenting to suspensions by the President that they have to advise and consent to his appointments.

There is no ingenuity sufficiently skilled in special pleading to separate the two powers of suspension and appointment, and make each absolute and independent of the other, and at the same time claim that the custodian of one power is entitled to all the papers and documents in the sole keeping of the custodian of the other power and relating exclusively to matters within his jurisdiction.

But it is insisted that the President has no right to know or to inquire what use the Senate intends making of the papers and documents. Can it be seriously urged that if the papers and documents called for are not public but private, and relate exclusively to the official acts of the President, for which he is under no responsibility to the Senate, that the Senate has any right to their possession? Who is to judge whether the papers and documents are public or private—the President, who knows their contents and to what they relate, or the Senate, which has no such information? How is the Senate to pass on the character and contents of the papers and documents before seeing them, and how will it be if after inspection of the papers and documents the Senate decides it has no right to their possession? How can the President possibly avoid knowing what use the Senate intends making of the papers when they show on their face that they can not be made to relate to anything but suspension? And if it were possible for the President to close his eyes to the contents of the papers and documents and the use that is to be made of them by the Senate, can the right be denied to those Senators who resist the claim of the Senate to have inspection of papers and documents relating exclusively to suspensions by the President to know what use is intended to be made of the papers and documents by the Senate?

The minority claim to know what use is intended to be made by the majority of your committee of the papers and documents called for and relating exclusively to suspensions, and with that knowledge the minority are satisfied that their possession and use by the Senate is unconstitutional and supported by no law, usage, or public policy, and that their transmission to the Senate was rightfully refused by the Attorney-General on the order of the President.

The debate on the subject was long and earnest. Mr. Edmunds, of Vermont, said : "The suspension of an officer is said by the minority of the committee to be an act solely within the exclusive discretion of the President of the United States. So say the majority of the committee. But is not the suspension of a public officer an official act? The statute says it is; the President says it is. When under his seal and signature and the certificate of the Secretary of State, the attesting witness of the authenticity of the document, he suspends an officer, he does it officially. Of course he has no right to do it privately. It is the President, and not the man, that suspends the officer, and it is therefore an official act. Therefore, every paper which is addressed to the officer exercising that function, in his character as the officer exercising that function and upon that topic, must be an official paper. No matter how vile it may be, no matter how false it may be, no matter how little influence it may produce upon the mind of the officer who has to act upon it, it is not the less an official paper. It does not belong to the man, be he President, or Secretary, or Attorney-General, but it belongs to the officer in his character as an officer. I take it there can be no question of that.

"The Attorney-General, it may be added—

for, as I say, these remarks that I am now making are quite aside from any questions we have at present before us—the Attorney-General of the United States, in his response to this resolution of the Senate, makes no hint that any part of the papers there, whether called for or not called for, were private and unofficial and personal or even confidential. Public papers, official papers, were called for. Public papers, official papers, are spoken of and only spoken of in his response. He says that these papers called for by the Senate relate exclusively to the suspension of Duskin. How relate? Do they relate to the motives of the President of the United States in suspending Duskin, do you suppose? Do you suppose the President or any of his friends had filed in the Department of Justice a statement of his motives in proceeding in the case of Duskin to perform a high, official, and important act? By no means. That would be absurd and ridiculous.

"These papers, therefore, on the statement of the Attorney-General, that relate exclusively to the suspension of Duskin, must state facts, or what are alleged to be facts, regarding the conduct of that officer either in his career in doing the business that the laws of the United States impute to him, or in his career as a citizen and man, rendering him fit to be continued in his place or rendering him deserving of being put under civil arrest until his case can be considered in the way that the law has provided. That is what they must be, as we all know. Now, then, if the Senate is called upon, as it is, to assist in displacing this man permanently from his office, the very papers that exist there on the admission of the Attorney-General are papers which relate to the conduct and management of that office while he had possession of it. And yet the minority of the committee tell us that inasmuch as these papers, if they were produced, would not only give us the facts upon which we ought to act for the proposed removal of this man, but would enable us to understand the reason that the President had for exercising that high official act, therefore the Senate of the United States being called upon to pronounce judgment on the official conduct of this man, and the President of the United States having been previously called upon within his jurisdiction to pronounce a judgment upon a similar question about the same man, the Senate can not have the papers, because if they aid in the exercise of their jurisdiction it would disclose the ground upon which the President acted in the exercise of his! If that is not a proposition which would stagger the credulity and amaze the understanding of any intelligent man in a government of laws or in a government of reason, I am quite unable to comprehend what would be."

Mr. Pugh, of Alabama, argued that the demand for papers made upon the Attorney-General

was a demand for private papers. He said: "Are the papers called for from the Attorney-General such as the Senate has the right to have in the discharge of any of its duties? The President states that the papers are private, unofficial, and relate to nothing over which the Senate has jurisdiction. The majority of the Judiciary Committee and its distinguished chairman the Senator from Vermont say that this information, although unofficial and private, does enable the Senate to discharge a duty that it has, a power that it claims, of revising the official act of the President in suspending George M. Duskin as district attorney.

"That is the undisputed basis of the claim to these private unofficial papers and documents. It is a claim of the power of the Senate to exercise the same control and revision over the act of suspension or removal which is claimed and exercised and given to the Senate expressly by the Constitution of advising and consenting to appointments. There is no mistake about that being the claim asserted by the majority of the Judiciary Committee, and there is no mistake that the resolution reported condemns the official act of the Attorney-General for the reason that he has withheld, on the order of the President, information that he states was composed of private documents and papers that he said were unofficial and private, and withheld from the Senate on the President's positive order because they are private, because they are unofficial, and relate to no duty that the Constitution or law imposes upon the Senate to discharge.

"Is there anything in the history of the Government to support this claim? The distinguished Senator from Vermont has presented a large array of what he calls precedents. I undertake to say, and I challenge denial upon the fullest test, that there is no case in the history of the Government for eighty years where any such documents as those called for in the resolution were ever transmitted to the Senate in executive or public session on the order of the Senate upon an Attorney-General or President."

Mr. Morgan, of Alabama, said: "Let us give to the Senate and the President the sort of safeguard and restraint also that the courts employ in the protection of grand juries and traverse juries; and let us protect the President, his advisers and informants, against the forced revelation of the facts upon which he removes a man from office, as we protect witnesses and grand jurors from the dangers to them and to the public welfare which would arise from the disclosure of their votes in charging powerful men or powerful bands of conspirators with great crimes. The wise decree of public policy is that no man has the right to require of a public officer information of a fact the publication of which will injure the State, unless the fact is essential to the performance of some duty to the

State which he is bound to render in obedience to the Constitution or the law.

"The motives of the President in the suspension of Duskin was the actual subject of the inquiry, however ingeniously the purpose is masked by special pleading. The Committee on the Judiciary based its right to make the inquiry, not upon the right of the Senate to legislate for the benefit of the country or to gather evidence on which Duskin could be impeached or censured, but upon the ground that the Senate is empowered by the Constitution and the law to prohibit the President from removing certain classes of officers, and that therefore they have the right to be informed of every fact that operated on the mind of the President in suspending Duskin from office.

"If the Senate has no such power, their interference in this matter can not be justified, unless they are seeking to show that the President is guilty of some misdemeanor in office in the removal of Duskin for which he ought to be impeached. If that is the purpose, and if the Senate believes, as the committee believe—if they believe anything—and have declared in these resolutions, let the Senate order an investigation upon charges preferred by them against the Attorney-General or against the President, accusing them of a high crime or misdemeanor in office. Let them direct the committee to send for persons and papers and ascertain the facts which will show the guilt of these high officers, or else will show the grave wrong, which I hope is a mistake, of those who bring an unjust accusation in regard to a matter over which they have no jurisdiction and condemn a high officer as a criminal for denying to the Senate a power which they are eager to usurp. If the Senate must impeach and condemn an officer in an *ex parte* proceeding, let it at least have the courage to say that the offense is or is not impeachable.

"When the Senate is considering a nomination to office, and, as collateral to that question, chooses to consider the reasons that induced the President to remove somebody else from the same office, will it deny to the act of the President full faith and credit, and assume to itself the power to assail his act by a direct proceeding and to set it aside and annul it? It must do this if it would open to examination the question whether he acted honestly in making the removal.

"The Senate has the power to consider a nomination sent to it by the President. In doing this it acts directly and conclusively on the subject. It settles the question, and sends the result to the President as being conclusive on him. He is bound to give it full faith and credit, without any inquiry as to whether the Senate had good motives or sufficient evidence to warrant its action. The Senate has no power to consider a removal from office made by the President, except in a collateral and inconclusive way; and it rests with him to say whether he will or will not inform the Senate of the

reasons for his action, or as to the facts upon which he based his action. To my judgment it is a clear proposition that the President has a definite grant of power in the Constitution to remove persons from office; while the Senate has no more authority over participating in that act or to reverse it than the House of Representatives or the Supreme Court have."

Mr. Ingalls, of Kansas, who made the liveliest speech of the debate, argued that the necessity for investigation in regard to suspensions on the part of the Senate arose out of the professions of the President to the effect that he would not make removals except for cause. He said: "If when the President was inaugurated he had determined that the functions of Government should be exercised by officers selected from his own party, the nation would have been content; but he did not so determine, and herein and hereon is founded the justification that the majority of the Senate can satisfactorily use and employ in demanding that no action shall be had in connection with these suspensions from office until there has been satisfactory assurance that injustice has not been done. If it were understood that these suspensions and removals were made for political reasons, the country would be content, the Republican majority in the Senate would be content. But what is the attitude? Ever since his inauguration and for many months before, by many utterances, official and private, in repeated declarations never challenged, Mr. Cleveland announced that he would not so administer this Government. At the very outset, in his letter of acceptance, he denounced the doctrine of partisan changes in the patronage, and through all of his political manifesto down to the present time he has repeated these assurances with emphatic and unchanging monotony.

"He has declared that there shall be no changes in office, where the incumbents were competent and qualified, for political reasons, but that they should be permitted to serve their terms. Like those who were grinding at the mill, one has been taken and another has been left. Some Republicans have been suspended and others have been retained. What is the irresistible inference? What is the logic of the events, except that, in view of what the President has declared, every man who is suspended is suspended for cause, and not for political reasons? It is not possible to suspect the President of duplicity and treacherous deception."

March 26, the resolutions submitted in the majority report of the Committee on the Judiciary were adopted. The vote on the first resolution was as follows:

YEAS—Aldrich, Allison, Blair, Cameron, Chace, Conger, Cullom, Dawes, Edmunds, Evarts, Frye, Hale, Harrison, Hawley, Hoar, Logan, McMillan, Mahone, Manderson, Miller, Mitchell of Oregon, Morrill, Platt, Plumb, Sabin, Sawyer, Sherman, Spooner, Stanford, Teller, Van Wyk, Wilson of Iowa—32.

NAYS—Beck, Berry, Blackburn, Brown, Butler,

CONGRESS. (DES MOINES RIVER LANDS.)

Call, Camden, Cockrell, Coke, Eustis, George, Gibson, Gorman, Gray, Harris, Jackson, Jones of Arkansas, Kenna, Macey, Morgan, Payne, Pugh, Ransom, Vornees, Walthall, Wilson of Maryland—26.

ABSENT—Bowen, Colquitt, Dolph, Fair, Hampton, Ingalls, Jones of Florida, Jones of Nevada, McPherson, Mitchell of Pennsylvania, Palmer, Pike, Riddleberger, Saulsbury, Sewell, Vance, Vest—17.

The vote on the second resolution was the same, except that Mr. Morgan was among the absent. The vote on the third resolution was 30 yeas to 29 nays. The vote on the fourth resolution was 56 yeas to 1 nay, Mr. Morgan voting in the negative. That gentleman offered the following resolution:

Resolved, That nothing in these resolutions contained is to be construed as declaring that the conduct of the Attorney-General renders him liable to impeachment, and the Senate disclaims the right or power to punish him by imprisonment or otherwise than by impeachment for the offense charged against him in the second resolution, which the Senate has just adopted.

It was laid on the table by a vote of 33 yeas to 26 nays.

The main point in the debate, though issue was joined on a technical question as to the resolution of the Senate and the Executive, was whether removal from office under the policy proclaimed by the new Administration involved an imputation on the official removed; and the purpose of the Republican Senators was to compel an acknowledgment that officials were removed merely on political grounds. In the course of the session the Secretary of the Treasury made an arrangement by which, in the case of collectors of internal revenue, it was conceded that where charges were not preferred removal was not in any way a reflection upon the official removed.

Des Moines River Lands.—The bill to quiet the title of settlers on the Des Moines river lands in Iowa, which had been before every Congress since the Forty-third, had been favorably reported many times, had passed the House of Representatives twice, and the Senate once, again passed the Senate, Feb. 11, 1886, without a division, and Feb. 24, passed the House in the same way. The measure was as follows:

Whereas, It is alleged that all the lands along the Des Moines river above the mouth of the Raccoon Fork, in the State of Iowa, referred to in the joint resolution of March 2, 1861 (12 Statutes, page 251), as certified to said State improperly by the Department of the Interior as under the grant of August 8, 1846, and which were treated in the Harvey settlement of May 20, 1866, as having been sold or otherwise disposed of by the United States, as mentioned or provided in the act of July 12, 1852 (12 Statutes, page 543), to extend the grant of 1846, and for which lands the State, in the Harvey settlement, received and accepted by the Department of the Interior after Secretary Browning's decision of May 9, 1868, and that by such settlement Iowa, in accepting the indemnity lands as referred to, is estopped from all claim to the lands in place that were improperly certified as river-land or under the act of 1846.

Whereas there are many settlers who, believing that the said lands were public lands, entered upon the same in good faith, and with the consent of the Department of the Interior, as pre-emptions and home-

steads, and since so doing, and after receiving patents, have been held by the courts as trespassers, or that the lands were reserved from settlement: Therefore,

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

That all the lands improperly certified to Iowa by the Department of the Interior under the act of August 8, 1846, as referred to in the joint resolution of March 2, 1861, for which indemnity lands were selected and received by the State of Iowa, as provided in the act of 1862, are, and are hereby declared to be, public lands of the United States: *Provided*, That the title of all *bona-fide* settlers under color of title from the State of Iowa and its grantees, or the United States and its grantees, which do not come in conflict with pre-emption or homestead claimants, are hereby ratified and confirmed, and made valid: *Provided further*, That the claims of all persons who, with intent, in good faith, to obtain title thereto under the pre-emption or homestead laws of the United States, entered or remained upon any tract of said land prior to January, 1880, not exceeding one hundred and sixty acres, are hereby confirmed and made valid in them, their heirs, or their proper assigns, and upon due proof thereof, and payment of the usual price or fees, where the same has not been paid, shall be carried to patent: *Provided further*, That the titles of all *bona-fide* claimants, under color of title from the State of Iowa and its grantees, or the United States and its grantees, which do not come in conflict with persons who, with intent, in good faith, to obtain title thereto, under the pre-emption or homestead laws of the United States, settled upon the said lands prior to January, 1880, are confirmed and made valid.

Sec. 2. That it is hereby made the duty of the Attorney-General, within ninety days after the passage of this act, to institute, or cause to be instituted, such suit or suits, either in law or equity, or both, as may be necessary and proper to assert and protect the title of the United States to said lands and remove all clouds from its title thereto; and until such suits shall be determined, and Congress shall so provide, no part of said lands shall be open for settlement or sale except as hereinbefore provided. And in any suits so instituted, any person or persons in possession of or claiming title to any tract or tracts of land under the United States involved in such suits may, at his or their expense, unite with the United States in the prosecution of such suits.

March 11, 1886, the President sent in the following veto message:

To the Senate of the United States:

I return herewith, without approval, and with a statement of my objections thereto, Senate bill No. 150, entitled "An act to quiet title of settlers on the Des Moines river lands in the State of Iowa, and for other purposes."

This proposed legislation grows out of a grant of land made to the Territory of Iowa in the year 1846 to aid in the improvement of the navigation of the Des Moines river.

The language of this grant was such that it gave rise to conflicting decisions on the part of the Government departments as to its extent, and it was not until 1860 that this question was authoritatively and finally settled by the Supreme Court of the United States. Its decision diminished the extent of the grant to a quantity much less than had been insisted on by certain interested parties, and rendered invalid the titles of parties who held, under the Territory or State of Iowa, lands beyond the limit of the grant fixed by the decision of the court.

For the purpose of validating such titles and to settle all disputes so far as the General Government was concerned, the Congress, in the year 1861, by a joint resolution, transferred to the State of Iowa all the title then retained by the United States to the lands within the larger limits which had been claimed and then held by *bona-fide* purchasers from the State; and in

1862 an act of Congress was passed for the same general purpose.

Without detailing the exact language of this resolution and statute, it certainly seems to be such a transfer and relinquishment of all interests in the land mentioned on the part of the United States as to relieve the Government from any further concern therein.

The questions unfortunately growing out of this grant, and the legislation relating thereto have been passed upon by the United States Supreme Court in numerous cases; and as late as 1883 that court, referring to its many previous decisions, adjudged:

"That the act of 1862 (C. 161, 12 Stats., 543) transferred the title from the United States and vested it in the State of Iowa, for the use of its grantees under the river grant."

Bills similar to this have been before Congress for a number of years, and have failed of passage; and at least on one occasion the Committee on the Judiciary of the Senate reported adversely upon a measure covering the same ground.

I have carefully examined the legislation upon the subject of this grant, and studied the decisions of the court upon the numerous and complicated questions which have arisen from such legislation, and the positions of the parties claiming an interest in the land covered by said grant; and I can not but think that every possible question that can be raised, or at least that ought to be raised, in any suit relating to these lands, has been determined by the highest judicial authority in the land. And if any substantial point remains yet unsettled, I believe there is no difficulty in presenting it to the proper tribunal.

This bill declares that certain lands which nearly twenty-four years ago, the United States entirely relinquished are still public lands, and directs the Attorney-General to begin suits to assert and protect the title of the United States in such lands.

If it be true that these are public lands, the declaration that they are so by enactment is entirely unnecessary; and if they are wrongfully withheld from the Government, the duty and authority of the Attorney-General are not aided by the proposed legislation. If they are not public lands because the United States have conveyed them to others, the bill is subject to grave objections as an attempt to destroy vested rights and disturb interests which have long since become fixed.

If a law of Congress could, in the manner contemplated by the bill, change, under the Constitution, the existing rights of any of the parties claiming interests in these lands, it hardly seems that any new questions could be presented to the courts which would do more than raise false hopes and renew useless and bitter strife and litigation.

It seems to me that all controversies which can hereafter arise between those claiming these lands have been fairly remitted to the State of Iowa, and that there they can be properly and safely left; and the Government, through its Attorney-General, should not be called upon to litigate the rights of private parties.

It is not pleasant to contemplate loss threatened to any party acting in good faith, caused by uncertainty in the language of laws or their conflicting interpretation; and if there are persons occupying these lands who labor under such disabilities as prevent them from appealing to the courts for a redress of their wrongs, a plain statute, directed simply to a remedy for such disabilities, would not be objectionable.

Should there be meritorious cases of hardship and loss, caused by an invitation on the part of the Government to settle upon lands apparently public, but to which no right nor lawful possession can be secured, it would be better, rather than to attempt a disturbance of titles already settled, to ascertain such losses and do equity by compensating the proper parties through an appropriation for that purpose.

A law to accomplish this very object was passed by

Congress in the year 1873. Valuable proof is thus furnished by the only law ever passed upon the subject of the manner in which it was thought proper by the Congress at that time to meet the difficulties suggested by the bill now under consideration.

Notwithstanding the fact that there may be parties in the occupancy of these lands who suffer hardship by the application of strict legal principles to their claims, safety lies in the non-interference by Congress with matters which should be left to judicial cognizance; and I am unwilling to concur in legislation which, if not an encroachment upon judicial power, trenches so closely thereon as to be of doubtful expediency, and which at the same time increases the elements of litigation that have heretofore existed and endangers vested rights.

GROVER CLEVELAND.
EXECUTIVE MANSION, March 11, 1886.

In the debate in the Senate on the motion to pass the bill over the President's veto, Mr. Evarts, of New York, said:

"If any one will point out to me the right or the method of asserting these homestead or pre-emption claims against the title made under the State of Iowa to the Des Moines Navigation Company by the United States in their legislation I shall be happy to consider it; but I do not know that when this was challenged in the last debate in the last Congress in this body then that an attempt was made to do so.

"Of course that there should be a body of land in dispute is injurious to all concerned. It is always injurious to the neighborhood, to the development of the State. These lands, I am told, are as fortunate and fertile perhaps as any equal amount of the favored land of that great State of Iowa; and all who are involved in either the discouragement or despair of failing in lands which they thought they could gain are entitled to full and ample consideration; but the question of the method to be adopted and pursued to that end brings us now to what is a very simple and a very intelligible proposition.

"If it be true that the United States now has any title in this land, if it now constitutes a part of the public domain, the United States can assert by such methods as the law opens to the United States the maintenance of that title; and when that title has been established and by determination the land has come back into the public domain, then I suppose not a single voice would be raised against entertaining and disposing of just claims that have rested upon this dormant title that is finally established, as it would be in the case I have supposed, in the United States.

"But this bill does not proceed upon that proposition. Pending the course of legislation and pending the course of judicial determination, such as it is, for a series of years an attempt has been made to put these claimants or the United States in their behalf upon a footing which the law and the courts did not give them. Several times in past sessions the bill has passed one or the other of the bodies of Congress, but not until now has it passed both houses and been presented to the President for his sanction to its becoming a law. His ex-

amination of it has led him to think that for grave reasons, very tersely and yet very comprehensively stated in this message of the President, this disturbance of the courts and of the law and reconsideration by the United States of legislation which has been determinative of this point should not be allowed."

In the course of an argument for the bill, Mr. Wilson, of Iowa, said :

"This disputation concerning these lands has clouded the title for a quarter of a century of all the lands embraced within the alleged grant, lying in one of the most beautiful sections of Iowa. Men who have gone upon those lands as settlers in the early days when that region was the advanced frontier post of civilization, having clustering around the lands upon which they settled and the homes which they there created all of those tender sentiments that tie men to home, were not willing, even if it required personal sacrifice, to have those ties all sundered and go out in the world again in search of other homes. So they said to this company, some of them, 'In order to have peace we will buy in your title such as you have.' So contracts were made with many of them by this company through an agent it had out in the State of Iowa. Rather than resist, rather than be troubled, in order to have some ascertainment of their cases, they entered into the contracts and agreed to pay, and many of them did pay, the contract price to the agent of this company. The agent was unfaithful. He did not account to his principals for the money thus received, and they repudiated his authority to receive the money, asserted that the contract was yet subsisting, sued upon the contract, and in some cases ousted these people from their homes.

"This company come here to plead not only law but equity. Will it come here with the clean hands that must go in where equity obtains? It is not found in the record of that company in the State of Iowa, neither in the greed which it has manifested concerning the return for the comparatively small outlay that it made in connection with that improvement, nor in the manner with which it has treated with the people settled upon those lands. I have here, but I shall not take the time to read them, letters from many of these men, men who have been there, as I have said, more than a quarter of a century, who have looked forward to the time when their titles should come to them from the Government, and their homes would be assured to them. While they have waited they have gone on as industrious pioneers are wont to do, reclaiming the wilds and making them habitations for progress and civilization. They have waited. Some of them have conference yet with this company. Others now occupying the lands, but as they say, tenants by sufferance, have had hard lines dealt out to them by this innocent company.

"I have one case here where a settler entered upon an eighty-acre tract of land as a pre-emptor. In the course of time he purchased

from this company eighty acres more. He gave them his contract secured upon the one hundred and sixty acres, and what was the result? The company sued him for the balance. It was but a small amount comparatively, only \$500, but he had consumed what little savings he had in buying in the eighty acres of land and in making the balance. Judgment was rendered; execution was issued. The first eighty acres were sold. The tract did not bring enough to pay the judgment. The second eighty acres were sold, and the home of the man was gone, both that part of the land upon which he entered as a pre-emptor and that which he bought from the company. Has this company been harshly dealt with? It would have been at least humane for it to have allowed this poor man to retain one of the eighty-acre tracts, inasmuch as this preposterous claim was the occasion of the small sum realized for the sale of that land. And why? Because a disturbed title is not a marketable article at fair value and because of this disturbed title claimed by this company the man's possessions went from him, and to-day he is homeless and his family with him.

"I might go on with scores of cases like this, but I will not consume the time of the Senate. I insist that the United States shall, by the enactment of this bill, notwithstanding the President's objection thereto, make at least an honest endeavor to protect the men it invited upon these lands twenty-five years ago. I insist not only for them that this remedy shall be accorded, but for all, the company itself as well as its grantees. Therefore it is provided in the bill that in all cases where there are not conflicting claims the title shall be confirmed in the holders, whether they be the Des Moines Navigation Company, its grantees, or others, the purpose of the bill and the remedy it provides being to settle now within the reasonable time which may be necessary to devote to the proposed remedy the titles to the lands in that great section of Iowa which have been disturbed so long. This, as I said in the last Congress when discussing the question, resolves itself on that account into a public question, for the disturbance of title is a serious injury to public interests and affairs."

June 29 the Senate passed the bill over the veto by the following vote:

YEAS—Allison, Beck, Berry, Blackburn, Blair, Call, Cameron, Chace, Cockrell, Coke, Conger, Dawes, Eustis, George, Hale, Harrison, Hoar, Ingalls, Jones of Arkansas, McMillan, Mahone, Manderson, Maxey, Mitchell of Oregon, Palmer, Plumb, Riddleberger, Sawyer, Sewell, Sherman, Spooner, Teller, Waithall, Wilson of Iowa—34.

NAYS—Brown, Butler, Colquitt, Edmunds, Evarts, Gray, Hampton, Hawley, McPherson, Miller, Platt, Ransom, Vance, Vest, Whithorne—15.

ABSENT—Aldrich, Bowen, Camden, Cullom, Dolph, Fair, Frye, Gibson, Gorman, Harris, Hearst, Jones of Florida, Jones of Nevada, Kenna, Logan, Mitchell of Pennsylvania, Morgan, Morrill, Payne, Pike, Pugh, Sabin, Saulsbury, Stanford, Van Wyck, Voorhees, Wilson of Maryland—27.

July 1, the question of passing the bill over the President's veto came up in the House. In the debate on the subject Mr. Payson, of Illinois, said:

"There are three classes of persons interested in these lands amounting to some 271,000 acres, that will be affected by this bill. There are, first, the men who claim under the navigation company, who are in possession and that nobody has claimed adversely to; there is a second set of people in possession under the general land law; and, third, a set of men claiming under the State of Iowa as remote grantees from the Des Moines Navigation Company. Now, what does the bill propose? It settles the titles of the first and last named classes in possession, and provides that the title of everybody in the Des Moines Navigation Company and its grantees, not in possession, that their title shall be validated.

"It provides, secondly, that those who are in possession claiming as grantees of the Des Moines Railroad and Navigation Company or as grantees from the State of Iowa shall have their title validated. And as to the other class, those who are claiming in good faith under the general land laws of the United States, it is provided that they shall be permitted to assert their rights in court. This bill does not seek to interfere with the title of any man whatever which does not clash with that of a settler. It does not presume that the title of the railroad and navigation company is invalid. It leaves all that question for judicial determination where it interferes with a settler's title. But the officers of the Interior Department have failed hitherto, and still fail, to remove the state of reservation. An act of Congress which was passed in 1853 provides in substance that wherever an entry is made on public lands in good faith and the land is then in a state of reservation and when that state of reservation shall afterward be removed, the rights of these people shall be respected.

"It is provided that under that statute these men may be allowed and permitted to go into court and set up their homestead and pre-emption rights as against the railroad and navigation company. This is all the bill purports to do, and the only other thing that can result from the passage of this bill is the inconvenience of a lawsuit to the Des Moines Railroad and Navigation Company. In one side of the balance are the interests of twelve hundred American citizens who rely upon the promise which was made to them by those on whom they had a right to rely, the officers of the Interior Department. Relying upon that promise, they went out upon the frontier at an early day and braved the dangers and endured the hardships and privations of a frontier life. They paid their money into the treasury for the land on which they are living. That is one side of the balance. On the other side there is the inconvenience of a lawsuit to a corporation which has set up a claim to 270,000 acres of

land to which, in my judgment, it has no more right legally or equitably than I have to the desk under my hand.

"That is the case in a nutshell. Nobody pretends to gainsay it. I know what will be the argument on the other side, and the President of the United States intimates it in his message. The doors of the courts are open if these people have any legal rights, and he asks why they did not come in and assert them. In this he studiously avoids the proposition that under existing law the doors of the courts are shut to the people because of the state of reservation in which these lands have been for all these years."

The motion to override the President's veto failed by the following vote—less than two thirds voting in the affirmative:

YEAS—G. E. Adams, J. M. Allen, J. A. Anderson, Atkinson, Barker, Barksdale, Barry, Blayne, Bingham, Bland, Bound, Bouteille, Brady, T. M. Browne, C. E. Stone of Kentucky, Storm, Throckmorton, Trigg, Turner, Viele, Wallace, T. B. Ward, Wheeler, Willis, Wilson.—93.

NOT VOTING—Aiken, C. H. Allen, Arnot, Ballentine, Barbour, Bliss, W. W. Brown, Buchanan, Bunnell, Burleigh, Felix Campbell, T. J. Campbell, Catchings, Clardy, Clements, Cole, Collins, Compton, Comstock, Cooper, Croxton, Dawson, Eden, Ellsberry, Evans, Foran, Gay, Eustace Gibson, Glass, Glover, Goff, R. S. Green, W. J. Green, Hall, Hanback, Harris, Haynes, Heard, Hemphill, Hiscock, Hitt, Houk,

J. T. Johnston, J. T. Jones, King, Landes, Le Fevre, Lovering, Mahoney, J. J. O'Neill, Osborne, Parker, Phelps, Plumb, Reese, Riggs, Scott, Scranton, Shaw, Smalls, J. W. Stewart, Swope, J. R. Thomas, Thompson, Tucker, J. H. Ward, A. J. Weaver, Whiting—68.

Tariff Revision.—Nothing was done for the revision of the tariff, though various acts modifying the whole system of import duties or changing the rates on special articles were introduced. April 14, Mr. Morrison, of Illinois, from the Committee on Ways and Means, reported a measure “to reduce the tariff and to modify the laws in relation to the collection of the revenue”; and June 17 he moved that the House resolve itself into the Committee of the Whole House on the State of the Union to consider this bill. The motion was defeated by the following vote:

YEAS—J. J. Adams, J. M. Allen, C. M. Anderson, Ballentine, Barbour, Barksdale, Barnes, Barry, Beach, Belmont, Bennett, Blanchard, Bland, Blount, C. R. Breckinridge, W. C. P. Breckinridge, Burnes, Bynum, Cabell, Caldwell, Felix Campbell, Candler, Carleton, Catchings, Clardy, Clements, Cobb, Cole, Compton, Comstock, Cowles, Crain, Crisp, Croxton, Culberson, Daniel, Dargan, A. C. Davidson, R. H. M. Davidson, Dawson, Dibble, Dougherty, Dunn, Fisher, Ford, Forney, C. H. Gibson, Eustace Gibson, Glass, Glover, W. J. Green, Hale, Halsell, Hammond, Harris, Heard, Hemphill, J. S. Henderson, Herbert, Hewitt, Hill, Holman, Howard, Hudd, Hutton, James, T. D. Johnston, J. H. Jones, King, Kleiner, Laffoon, Landes, Lanham, Lore, Lovering, Lowry, Mahoney, Matson, Maybury, McCreary, McMillin, McRae, Miller, Mills, Mitchell, Morgan, Morrison, Neal, Neece, Nelson, Norwood, Oates, O'Ferrall, J. J. O'Neill, Outhwaite, Peel, Perry, Reagan, Reese, Richardson, Riggs, Robertson, Rogers, Sadler, Sayers, Scott, Seymour, Shaw, Singleton, Skinner, Snyder, Springer, Charles Stewart, W. J. Stone of Kentucky, W. J. Stone of Missouri, Storm, Strait, Swope, Tarsney, Tulbee, J. M. Taylor, Throckmorton, Tillman, Townshend, Trigg, Tucker, Turner, Van Eaton, Wakefield, T. B. Ward, J. B. Weaver, Wellborn, Wheeler, Willis, Wilson, Winans, Wise, Wolford, Worthington, John G. Carlisle—140.

NAYS—G. E. Adams, C. H. Allen, J. A. Anderson, Arnot, Atkinson, Baker, Bayne, Bingham, Bliss, Bound, Boutelle, Boyle, Brady, T. M. Browne, C. E. Brown, W. W. Brown, Brummett, Buchanan, Buck, Burrows, Butterworth, J. M. Campbell, J. E. Campbell, T. J. Campbell, Cannon, Conger, Cooper, Curtin, Cutcheon, Davenport, Davis, Dingley, Dorsey, Dowdney, Dunham, Ellsberry, Ely, Ermentrout, Evans, Everhart, Farquhar, Felton, Findlay, Fleeger, Foran, Fuller, Funston, Gallinger, Gay, Geddes, Gilfillan, Goff, R. S. Green, Grosvenor, Grout, Guenther, Harmer, Hayden, D. B. Henderson, T. J. Henderson, Henley, Hepburn, Herman, Hires, Hiscock, Holmes, Hopkins, Irion, Jackson, F. A. Johnson, J. T. Johnston, Kelley, Ketcham, La Follette, Laird, Lawler, Le Fevre, Leibach, Libbey, Lindsley, Little, Long, Louttit, Lyman, Markham, Martin, McAdoo, McComas, McKenna, McKinley, Merriman, Millard, Milliken, Moffatt, Morrill, Morrow, Muller, Negley, O'Donnell, O'Hara, Charles O'Neill, Osborne, Owen, Parker, Payne, Payson, Perkins, Peters, Phelps, Pidcock, Pindar, Plumb, Price, Randall, Ranney, T. B. Reed, Rice, Rockwell, Romeis, Rowell, Ryan, Sawyer, Scranton, Seney, Sessions, Smalls, Sowden, Spooner, Spriggs, Stahlnecker, Steele, J. W. Stewart, St. Martin, E. F. Stone, Struble, Swinburne, Symes, E. B. Taylor, I. H. Taylor, Zachary Taylor, J. R. Thomas, O. B. Thomas, Thompson, Viele, Wade, Wadsworth, Wait, Wallace, J. H. Ward, A. J. Warner, William Warner, J.

A. Weaver, Weber, West, Whiting, Wilkins, Woodburn—157.

Not Voting—Aiken, Bragg, Bunnell, Burleigh, Caswell, Collins, Cox, Dockery, Eden, Eldredge, Frederick, Hall, Hanback, Hatch, Haynes, Hiestand, Hitt, Houk, J. T. Jones, Murphy, Pettibone, Pierce, J. W. Reid, Stephenson, Van Schaick, A. C. White, Milo White—27.

Of the votes in the affirmative, 135 were cast by Democrats, 4 by Republicans, and 1 by a Greenback-Democrat; of the 157 negative votes, 121 were cast by Republicans, 85 by Democrats and 1 by a Greenback-Republican. The refusal to consider this measure was conceded to be a defeat of the tariff-reform policy. The bill was not that originally introduced by Mr. Morrison, and did not embody any scheme for horizontal reduction such as the Forty-eighth Congress rejected.

Temperance Measures.—March 18, 1886, the Senate passed without a division the bill passed by the Senate of the Forty-eighth Congress providing for a commission “to investigate the alcoholic liquor-traffic, its relations to revenue and taxation, and its general economic, criminal, moral, and scientific aspects in connection with pauperism, crime, social vice, the public health, and the general welfare of the people, and also to inquire as to the practical results of license and prohibitory legislation for the prevention of intemperance in the several States of the Union.” May 6, Mr. Frederick, from the Select Committee of the House on the Alcoholic Liquor-Traffic, reported the measure adversely. A minority of the committee made a favorable report, but no further action was taken.

March 18, 1886, the Senate passed without a division the following bill:

“To provide for the study of the nature of alcoholic drinks and narcotics, and of their effects upon the human system, in connection with the several divisions of the subject of physiology and hygiene by the pupils in the public schools of the Territories and of the District of Columbia, and in the Military and Naval Academies and Indian and colored schools in the Territories of the United States.”

Be it enacted, etc., That the nature of alcoholic drinks and narcotics, and special instruction as to their effects upon the human system, in connection with the several divisions of the subject of physiology and hygiene, shall be included in the branches of study taught in the common or public schools and in the Military and Naval Schools, and shall be studied and taught as thoroughly and in the same manner as other like required branches are in said schools, by the use of text-books in the hands of pupils where other branches are thus studied in said schools, and by all pupils in all said schools throughout the Territories, in the Military and Naval Academies of the United States, and in the District of Columbia and in all Indian and colored schools in the Territories of the United States.

SECTION 2. That it shall be the duty of the proper officers in control of any school described in the foregoing section to enforce the provisions of this act; and any such officer, school director, committee, superintendent, or teacher who shall refuse or neglect to comply with the requirements of this act, or shall neglect or fail to make proper provisions for the instruction required and in the manner specified by the

first section of this act for all pupils in each and every school under his jurisdiction, shall be removed from office and the vacancy filled as in other cases.

Sec. 3. That no certificate shall be granted to any person to teach in the public schools of the District of Columbia or Territories after the 1st day of January, A. D. 1888, who has not passed a satisfactory examination in physiology and hygiene, with special reference to the nature and the effects of alcoholic drinks and other narcotics upon the human system.

May 17, 1886, the House passed this measure by a vote of 210 yeas to 8 nays, 105 members being absent. May 20, it was approved by the President.

Fitz-John Porter.—Dec. 21, 1885, Mr. Wheeler, of Alabama, introduced a bill for the relief of Fitz-John Porter, which was substantially the same as that passed at the first session of the Forty-eighth Congress and vetoed by President Arthur. January 19, it was reported favorably from the Committee on Military Affairs as follows:

Whereas the board of Army officers convened by the President of the United States, by special orders, numbered 78, headquarters of the Army, April 12, 1878, to examine into and report upon the case of Fitz-John Porter, late a major-general of the United States Volunteers and a brevet brigadier-general and colonel of the Army, having by their report of March 19, 1879, stated that, in their opinion, "justice required at his (the President's) hands such action as may be necessary to annul and set aside the findings and sentence of the court-martial in the case of Maj.-Gen. Fitz-John Porter, and to restore him to the positions of which the sentence deprived him, such restoration to take effect from the date of dismissal from the service"; and

Whereas the President, on the 4th day of May, 1882, remitted so much of the sentence of said court-martial remaining unexecuted as "forever disqualified the said Fitz-John Porter from holding any office of trust or profit under the Government of the United States"; Therefore, that justice may be done the said Fitz-John Porter, and to carry into effect the recommendation of said board,

Be it enacted, etc., That the President be and he is hereby authorized to nominate and, by and with the advice and consent of the Senate, to appoint Fitz-John Porter, late a major-general of the United States Volunteers and a brevet brigadier-general and colonel of the Army, to the position of colonel in the Army of the United States, of the same grade and rank held by him at the time of his dismissal from the Army by sentence of court-martial promulgated January 27, 1863, and, in his discretion, to place him on the retired list of the Army as of that grade, the retired list being hereby increased in number to that extent; and all laws and parts of laws in conflict herewith are suspended for this purpose only: *Provided*, That said Fitz-John Porter shall receive no pay, compensation, or allowance whatsoever prior to his appointment under this act.

The measure was debated in both House and Senate with all the old-time enthusiasm. It passed the former body, February 18, by the following vote:

YEAS—J. J. Adams, J. M. Allen, C. M. Anderson, Baker, Ballantine, Barnes, Barry, Bayne, Beach, Belmont, Bennett, Blanchard, Bland, Bliss, Blount, Bragg, C. R. Breckinridge, W. C. P. Breckinridge, Burleigh, Burns, Bynum, Cabell, Felix Campbell, J. E. Campbell, T. J. Campbell, Candler, Carleton, Catchings, Clardy, Clements, Cobb, Collins, Compton, Constock, Cowles, Crain, Crisp, Culberson, Curtin, Daniel, Dargan, A. C. Davidson, R. H. M. David-

son, Dibble, Dockery, Dougherty, Dowdney, Dunn, Eden, Eldredge, Ellsberry, Ely, Ermentrout, Findlay, Fisher, Foran, Ford, Forney, Frederick, Gay, Geddes, C. H. Gibson, R. S. Green, W. J. Green, Hahn, Hale, Hall, Halsell, Hammond, Harmer, Harris, Hatch, Hayden, Haynes, Heard, Hemphill, J. S. Henderson, Henley, Herbert, Hewitt, Holman, Howard, Hutton, Irion, James, T. D. Johnston, J. H. Jones, J. T. Jones, Kleiner, Laffoon, Laird, Lanham, Lawler, Le Fevre, Lore, Lovering, Lowry, Mahoney, Martin, Matson, Maybury, McCreary, McMillan, McRae, Merriam, Miller, Mills, Mitchell, Morgan, Morrison, Muller, Murphy, Neal, Norwood, Oates, O'Ferrall, O'Hara, J. Reid, Richardson, Riggs, Robertson, Rockwell, Rogers, Sadler, Sayers, Seney, Seymour, Singleton, Skinner, Snyder, Sowden, Springer, Stahnecker, Charles Stewart, St. Martin, W. J. Stone of Kentucky, W. J. Stone of Missouri, Storm, Swinburne, Swope, Tarsney, Taulbee, J. M. Taylor, Throckmorton, Tillman, Tucker, Van Eaton, Viele, Wadsworth, J. H. Ward, T. B. Ward, A. J. Warner, J. B. Weaver, Weber, Wellborn, Wheeler, Wilkins, Willis, Wilson, Winans, Wise, Wolford, Worthington—171.

NAYS—G. E. Adams, C. H. Allen, J. A. Anderson, Atkinson, Bingham, Bound, Boutelle, T. M. Browne, C. E. Brown, W. W. Brown, Brumm, Buchanan, Buck, Bunnell, Burrows, Butterworth, J. M. Campbell, Cannon, Caswell, Conger, Cooper, Cutcheon, Davenport, Davis, Dingley, Dorsey, Dunham, Evans, Everhart, Farquhar, Fleeger, Fuller, Funston, Gallinger, Gilfillan, Grosvenor, Grout, Guenther, Hanback, D. B. Henderson, T. J. Henderson, Hepburn, Herman, Hiestand, Hires, Hiscock, Hitt, Holmes, Hopkins, Houk, Jackson, F. A. Johnson, J. T. Johnston, Kelley, Ketcham, La Follette, Lehlbach, Lindsay, Little, Lottut, Lyman, Markham, McComas, McKenna, McKinley, Millard, Milliken, Moffatt, Morrill, Morrow, Negley, Nelson, O'Donnell, Charles O'Neill, Osborne, Owen, Parker, Payne, Payson, Perkins, Peters, Pirce, Price, T. B. Reed, Rice, Rowell, Ryan, Sawyer, Scranton, Sessions, Smalls, Spooner, Steele, Stephenson, J. W. Stewart, E. F. Stone, Strait, Struble, Symes, E. B. Taylor, I. H. Taylor, Zachary Taylor, J. R. Thomas, O. B. Thomas, Thompson, Van Schaick, Wakefield, William Warner, A. J. Weaver, West, Milo White, Whiting, Woodburn—113.

Not Voting—Aiken, Arnot, Barbour, Barksdale, Boyle, Brady, Caldwell, Cole, Cox, Croxton, Dawson, Felton, Eustace Gibson, Glass, Glover, Goff, Hill, King, Landes, Libbey, Long, McAdoo, Neece, Pettibone, Plumb, Pulitzer, Randall, Ranney, Reese, Romeis, Scott, Shaw, Spriggs, Townshend, Trigg, Turnier, Wade, Wait, A. C. White—39.

In the Senate the bill was reported March 4 and passed June 25 by the following vote:

YEAS—Beck, Berry, Blackburn, Brown, Butler, Call, Cameron, Cockrell, Coke, Colquitt, George, Gibson, Gorman, Gray, Hoar, Jones of Arkansas, Jones of Nevada, McPherson, Maxcy, Mitchell of Oregon, Pugh, Ransom, Riddleberger, Sewell, Vance, Vest, Voorhees, Walthall, Whithorne, Wilson of Maryland—30.

NAYS—Aldrich, Allison, Conger, Cullom, Evarts, Frye, Hale, Harrison, Hawley, Ingalls, Logan, Mansfield, Palmer, Sawyer, Spooner, Teller, Wilson of Iowa—17.

ABSENT—Blair, Bowen, Camden, Chace, Dawes, Dolph, Edmunds, Eustis, Fair, Hampton, Harris, Hearst, Jones of Florida, Kenn, McMillan, Mahone, Miller, Mitchell of Pennsylvania, Morgan, Morrill, Payne, Pike, Platt, Plumb, Sabin, Saulsbury, Sherman, Stanford, Van Wyck—29.

In the course of the discussion Mr. Teller, of Oregon, offered the following amendment to the bill, which was rejected:

SECTION.—That the President be and he is hereby authorized to nominate and, by and with the advice and consent of the Senate, to appoint Alfred Pleasonton, late a major-general of the United States Volunteers and a brevet major-general of the United States Army, to the position of colonel in the Army of the United States, and to place him on the retired list of the Army as of that grade, the retired list being hereby increased in number to that extent; and all laws and parts of laws in conflict herewith are suspended for this purpose only.

Mr. Plumb, of Kansas, offered the following amendment, which was rejected:

That the Secretary of the Interior is hereby authorized and directed to place on the pension-roll, subject to the provisions and limitations of the pension laws, the name of Maria Hunter, widow of David Hunter, late colonel of the Sixth Regiment United States Cavalry, and major-general of United States Volunteers, at the rate of \$50 per month.

Mr. Blair, of New Hampshire, offered the following amendment, which was rejected:

Sec. — That in all cases of applications for pensions, under the laws of the United States, which shall have been rejected on appeal from the decision of the Commissioner to the Secretary of the Interior, the claimant of the pension, or his legal representative to the right of the pension, may file his petition in the District Court of the United States in the district wherein he resides, for the pension, setting forth, with other necessary averments, the rejection of his claim by the Secretary of the Interior; and thereupon the court shall hear and try his cause, and such proceedings shall be had as in other cases, including the trial by jury whenever the claimant demands it, and the right of appeal to the higher courts upon questions of law and fact; and upon the hearing the claimant shall have the right to use all evidence, documents, and papers of every description which have been filed in the proceedings before the Commissioner of Pensions and Secretary of the Interior; and all record or other evidence in possession of the Government, or copies thereof, shall be furnished, on application by the claimant, for use in such proceedings in the district court.

Mr. Logan, of Illinois, offered the following amendment, which was rejected:

That all officers who were engaged in the battle of Bull Run, on the 29th and 30th of August, 1862, who were in command of Union troops during said battle on either of the days above mentioned, who received wounds during said engagement causing the loss of arm, leg, or eye, and who were afterward honorably discharged from the service of the United States, shall, on application and proof of the foregoing facts, be placed upon the retired list with the rank held by them at the time of receiving such wounds, whether in the regular or volunteer service. Vacancies on the retired list are hereby created for this purpose, if the President shall see fit to nominate them to the Senate and the Senate shall confirm the same.

The same gentleman offered the following proviso to be added to the original bill, but it was also rejected:

Provided, That any officer of the volunteer service who received an *honorable discharge* from the United States service for services rendered the Union during the late rebellion, and who received a wound or wounds producing total disability, or which incapacitated him from pursuing his usual avocation in procuring a livelihood, shall, on application and proof of the above facts, be placed upon the retired list with the rank held by such officer at the time of receiving the wound or wounds aforesaid: *Provided*, That the President shall see fit to nominate them to the Senate.

The President approved of the bill July 1, 1886.

Chinese Matters.—In the Senate a bill, supplementary to and amendatory of “An act to execute certain treaty stipulations relating to the Chinese,” approved May 6, 1882, as amended by an act to amend said act, approved July 5, 1884, was passed June 1, 1886, without a division; but in the House no action was taken beyond referring the measure to an appropriate committee. June 4, the Senate passed, by a vote of 30 to 10, a measure providing for the payment of indemnity to certain Chinese subjects who suffered in person and property from the violence of a mob at and near Rock Springs, Wyoming Territory, Sept. 2, 1885, the aggregate amount awarded not to exceed \$150,000. In the House, the measure got no further than a reference to a committee. The President sent to Congress the following message on the subject:

To the Senate and House of Representatives of the United States:

I transmit herewith for the consideration of Congress, with a view to appropriate legislation in the premises, a report of the Secretary of State, with certain correspondence, touching the treaty right of Chinese subjects other than laborers, “to go and come of their own free will and accord.”

In my annual message of the 8th of December last I said:

“In the application of the acts lately passed to execute the treaty of 1880, restrictive of the immigration of Chinese laborers in the United States, individual cases of hardship have occurred beyond the power of the Executive to remedy, and calling for judicial determination.”

These cases of individual hardship are due to the ambiguous and defective provisions of the acts of Congress approved respectively on May 6, 1882, and July 5, 1884. The hardship has, in some cases, been remedied by the action of the courts. In other cases, however, where the phraseology of the statutes has appeared to be conclusive against any discretion on the part of the officers charged with the execution of the law, Chinese persons expressly entitled to free admission under the treaty have been refused a landing and sent back to the country whence they came, without being afforded any opportunity to show in the courts or otherwise their right to the privilege of free ingress and egress which it was the purpose of the treaty to secure.

In the language of one of the judicial determinations of the Supreme Court of the United States, to which I have referred, “the supposition should not be indulged that Congress, while professing to faithfully execute the treaty stipulations, and recognizing the fact that they secure to a certain class the right to go from and come to the United States, intended to make its protection depend upon the performance of conditions which it was physically impossible to perform. (U. S. R. 112, p. 554, *Chew Heong vs. U. S.*)

The act of July 5, 1884, imposes such an impossible condition in not providing for the admission, under proper certificate, of Chinese travelers of the exempted classes in the cases most likely to arise in ordinary commercial intercourse.

The treaty provisions governing the case are as follows:

“ARTICLE I. . . . The limitation or suspension shall be reasonable, and shall apply only to Chinese who may go to the United States as laborers, other classes not being included in the limitations. . . .

“Art. II. Chinese subjects, whether proceeding to the United States as teachers, students, merchants, or

from curiosity, together with their body and household servants, . . . shall be allowed to go and come of their own free will and accord, and shall be accorded all the rights, privileges, immunities, and exemptions which are accorded to the citizens and subjects of the most favored nation."

Section 6 of the amended Chinese immigration act of 1884 purports to secure this treaty right to the exempted classes named by means of prescribed certificates of their status, which certificates shall be the *prima facie* and the sole permissible evidence to establish a right of entry into the United States. But it provides in terms for the issuance of certificates in two cases only:

(a) Chinese subjects departing from a port of China; and

(b) Chinese persons (i. e., of the Chinese race) who may at the time be subjects of some foreign government other than China, and who may depart for the United States from the ports of such other foreign government.

A statute is certainly most unusual which, purporting to execute the provisions of a treaty with China in respect of Chinese subjects, enacts strict formalities as regards the subjects of other governments than that of China.

It is sufficient that I should call the earnest attention of Congress to the circumstance that the statute makes no provision whatever for the somewhat numerous class of Chinese persons who, retaining their Chinese subjection in some countries other than China, desire to come from such countries to the United States.

Chinese merchants have trading operations of magnitude throughout the world. They do not become citizens or subjects of the country where they may temporarily reside and trade; they continue to be subjects of China, and to them the explicit exemption of the treaty applies. Yet, if such a Chinese subject, the head of a mercantile house at Hong-Kong, or Yokohama, or Honolulu, or Havana, or Colon, desires to come from any of these places to the United States he is met with the requirement that he must produce a certificate, in prescribed form and in the English tongue, issued by the Chinese Government. If there be at the foreign place of his residence no representative of the Chinese Government competent to issue a certificate in the prescribed form, he can obtain none, and is under the provisions of the present law unjustly debarred from entry into the United States. His usual Chinese passport will not suffice, for it is not in the form which the act prescribes shall be the sole permissible evidence of his right to land. And he can obtain no such certificate from the government of his place of residence, because he is not a subject or citizen thereof, "at the time," or at any time.

There being, therefore, no statutory provision prescribing the terms upon which Chinese persons, resident in foreign countries but not subjects or citizens of such countries, may prove their status and rights as members of the exempted classes in the absence of a Chinese representative in such country, the Secretary of the Treasury, in whom the execution of the act of July 5, 1884 was vested, undertook to remedy the omission by directing the revenue officers to recognize as lawful certificates those issued in favor of Chinese subjects by the Chinese consular and diplomatic officers at the foreign port of departure, when visaged by the United States representative thereat. This appears to be a just application of the spirit of the law, although enlarging its letter, and in adopting this rule he was controlled by the authority of high judicial decisions as to what evidence is necessary to establish the fact that an individual Chinaman belongs to the exempted class.

He, however, went beyond the spirit of the act and the judicial decisions, by providing, in a circular dated Jan. 14, 1885, for the original issuance of such a certificate by the United States consular officer at the port of departure, in the absence of a Chinese

diplomatic or consular representative thereat. For it is clear that the act of Congress contemplated the intervention of the United States consul only in a supervisory capacity, his function being to check the proceeding and see that no abuse of the privilege followed. The power or duty of original certification is wholly distinct from that supervisory function. It either dispenses with the foreign certificate altogether, leaving the consular visa to stand alone and sufficient, or else it combines in one official act the distinct functions of certification and verification of the fact certified.

The official character attaching to the consular certification contemplated by the unamended circular of Jan. 14, 1885, is to be borne in mind. It is not merely *prima facie* evidence of the status of the bearer, such as the courts may admit in their discretion; it was prescribed as an official attestation, on the strength of which the customs officers at the port of entry were to admit the bearer without further adjudication of his status unless question should arise as to the truth of the certificate itself.

It became, therefore, necessary to amend the circular of Jan. 14, 1885, and this was done on the 13th of June following, by striking out the clause prescribing original certification of status by the United States consuls. The effect of this amendment is to deprive any certificate the United States consuls may issue, of the value it purported to possess, as sole permissible evidence under the statute when its issuance was prescribed by Treasury regulations. There is, however, nothing to prevent consuls giving certificates of facts within their knowledge, to be received as evidence in the absence of statutory authentication.

The complaint of the Chinese minister, in his note of March 24, 1886, is that the Chinese merchant, Lay Sang, of the house of King Lee & Co., of San Francisco, having arrived at San Francisco from Hong-Kong, and exhibited a certificate of the United States consul at Hong-Kong as to his status as a merchant and consequently exempt under the treaty, was refused permission to land, and was sent back to Hong-Kong by the steamer which brought him. While the certificate he bore was doubtless insufficient under the present law, it is to be remembered that there is at Hong-Kong no representative of the Government of China competent or authorized to issue the certificate required by the statute. The intent of Congress to legislate in execution of the treaty, is thus defeated by a prohibition directly contrary to the treaty; and conditions are exacted which, in the words of the Supreme Court hereinbefore quoted, "it was physically impossible to perform."

This anomalous feature of the act should be reformed as speedily as possible, in order that the occurrence of such cases may be avoided, and the imputation removed which would otherwise rest upon the good faith of the United States in the execution of their solemn treaty engagements.

GROVER CLEVELAND.

EXECUTIVE MANSION,
WASHINGTON, April 6, 1886.

Pensions.—Jan. 20, 1886, the House took up for consideration the bill to increase the pension of widows, minor children, and dependent relatives of soldiers and sailors. Mr. Matson, of Indiana, who had charge of the measure, said:

"The bill which has been read has been very thoroughly considered by the Committee on Invalid Pensions in this Congress and reported unanimously by that committee. The same committee in the Forty-eighth Congress considered the same proposition and reported it unanimously. The provisions of the bill are very simple. It provides that widows of sol-

diers—not of officers, but of soldiers—who are receiving a less rate of pension than \$12 per month shall be increased to \$12 per month. The increase in nearly all cases is from \$8 to \$12 per month. There are a very few cases, perhaps less than twenty in number, upon the pension-roll, in cases of the widows of warrant officers of the navy, where \$10 per month is given, but the substantial provision of this bill is an increase of pensions of widows of soldiers from \$8 a month to \$12 a month.

"The provisions of the bill also apply to dependent fathers and mothers who are drawing pensions on account of the death of their sons.

"I apprehend the proposition in reference to which this House wishes to be informed is as to what this is going to cost the people and the Government. A very careful estimate was made less than two years since, based upon the number of this class of pensioners upon the roll, an estimate based, too, upon the number of applications then pending of that kind, and the total cost was estimated by a gentleman who was thoroughly familiar with the Pension-Office, having served there for twenty years, and having been chief of the miscellaneous division, whose duty it was to make such estimate for the benefit of the Commissioner of Pensions and the Secretary of the Interior, and he fixed the cost at something over \$5,000,000—less than \$6,000,000.

"I wish to say further in relation to this matter that this rate of \$8 was passed in 1816, just after the War of 1812, and at that time it was the full pay of the soldier. This Government thought then when the soldier was killed in battle, or gave his life to the country in any way, his widow should be entitled to receive the pay her husband was receiving when he was in the Government service. Since that time the pay of a private soldier has been increased and has varied from \$11 to \$13 and up to \$16 a month. The proposition has been urged upon Congress to follow out the original principle, and to give to these widows and dependent parents the same pay that the soldier was receiving at the time he lost his life; but the committee thought it fit and wise to compromise by adopting a sum which bore a relation between the two extremes which had been paid, and therefore we have fixed upon a sum that is between the highest and the lowest rates paid for the service of the soldier, \$8 being the lowest and \$16 the highest.

"There is another thing, Mr. Chairman, to which I desire to call the attention of the committee, and that is that this bill applies to all widows of the soldiers of the wars in which this country has been engaged who are now on the rolls, and there is not a community throughout all the length and breadth of this land in which there is not some humble home in which light and joy will be shed by the action of this Congress in passing this bill. Eight dollars a month at this time, when it costs more to live than it did when the rate was fixed by

law, is not enough to support these old people. These widows and dependent relatives are growing old. I have received, I may safely say, since this proposition has been pending in Congress, thousands of letters from all parts of the country from these old women addressed to me, some of the writers stating that they were then over ninety years of age, all of them begging and asking this additional four dollars a month in order to enable them to live comfortably, or with a little more comfort, during the few remaining years of their lives. Now I have said this much in explanation of this bill, and I apprehend that there will be no very serious opposition to its passage."

In criticism of the measure, Mr. Reagan, of Texas, said :

"The policy of pensioning soldiers who have been disabled in the military service of the country and thereby rendered unable to earn a livelihood and support their families, the policy of pensioning the widows of such soldiers who have lost their lives in the service—I mean those who were their widows at that time—is a just and beneficent policy. No one would more cheerfully than myself vote pensions for such soldiers and such widows. We have pension laws providing, it would seem, for all the conditions that appeal to public justice. And yet, notwithstanding these laws, notwithstanding the Pension-Office is open to all entitled to pensions under the laws, we have a deluge of private bills for pensioning the soldiers of the war, or those who profess to be soldiers of the war, each session of Congress. And instead of the number diminishing, it is constantly increasing.

"I witnessed a scene on this floor in passing a bill giving arrearages of pension, I believe it was, when Democrats were urged to vote for it by Democrats, because it would give them the soldier-vote, as the Senate would defeat it anyhow; and Republicans were urged by Republicans to vote for it as they would get ahead of the Democrats for the soldier-vote, and because the Senate would defeat it anyhow. It went through this House, as any bill will go through this House that proposes a pension, and when it got to the Senate it went through that body with as great unanimity as it did through this.

"Now, Mr. Chairman, I had a friend in Congress a few years ago from the State of Kentucky, who had in mind a proposition which he thought would settle all this trouble, satisfy all parties; adjust the political trouble. It proposed to pension everybody in the United States, and give life-pay to retiring members of Congress. This, it seems to me, was a good bid. It seems when we are struggling for political power, if I should make this bid I would go as far as anybody could go to benefit my party by pensioning everybody and giving life-pay to retiring members of Congress.

"But what is this to come to? No one can doubt, no one will doubt, that I am correct in saying instead of the supreme and sole motive

being to secure justice to those who deserve a pension, a motive as strong as that, I would say stronger, is to bid for the soldiers' votes, and to pay the money of the tax-payers of this country as the price of political supremacy. We proceed here as if there were no tax-payers in this country. We proceed here as if there were a great fund of money collected together, and we were engaged in its distribution. But, Mr. Chairman, there are millions of toilers in this land, poor, afflicted, with families to support, earning their bread from day to day by their sweat, who have to pay taxes for every appropriation which we make. And I assume to warn members that we may reach the point at which the public judgment will revolt against this outrage of giving the public money for political supremacy, of taxing the people's sweat and toil, and giving away their money in this manner.

"Who has ever known one of these bills come up for consideration who has not seen this same thing enacted and re-enacted here? I will repeat, sir, what I said before, that the soldiers who are disabled in war ought to be pensioned, and I will vote as cheerfully as any man for every reasonable and proper pension for them, and also that those who are the widows of such soldiers, and were their wives when they were soldiers, or where the soldier lost his life in the public service, should be pensioned. No man will vote more cheerfully or readily than I a proper pension for such service; but I would drive the thousands who come here to these halls into the Pension-Office to make there the proof required by law to enable them to secure their pensions. I would not allow them to come here upon *ex parte* statements to play upon political feelings and obtain pensions in the name or on account of those who have really rendered service to the country. There is not a man here who does not know, I presume, that there are numbers of men receiving pensions to-day, I think I may safely say thousands, who are no more entitled to it than I am."

Feb. 1, Mr. Matson moved to take the bill out of Committee of the Whole and pass it with an amendment, limiting its application to widows married to a deceased soldier or sailor, prior to the passage of the act, or prior to or during his service. The motion was adopted by the following vote:

YEAS—G. E. Adams, C. H. Allen, C. M. Anderson, J. A. Anderson, Arnott, Atkinson, Baker, Bayne, Beach, Bland, Bound, Bouteille, Brady, T. M. Browne, C. E. Brown, W. W. Brown, Buchanan, Buck, Bunnell, Burleigh, Burrows, Butterworth, Bynum, J. M. Campbell, J. E. Campbell, T. J. O'Neill, Parker, Pettibone, Phelps, Pidcock, Pulitzer, Rogers, Sene, Smalls, Spriggs, Stephenson, J. W. Stewart, Swinburne, I. H. Taylor, Townshend, Van Schaick, Wade, T. B. Ward, A. J. Warner, Wise, Woodburn—59.

The text of the measure as passed is as follows:

Be it enacted, etc., That from and after the passage of this act the rate of pension for widows, minor children, and dependent relatives now on the pension-roll, or hereafter to be placed on the pension-roll, and entitled to receive a less rate than hereinafter provided, shall be \$12 per month; and nothing herein shall be construed to affect the existing allowance of \$2 per month for each child under the age of sixteen years. *Provided,* That this act shall apply only to widows who were married to the deceased soldier or sailor prior to its passage and to those who may hereafter marry prior to or during the service of the soldier or sailor. And all acts or parts of acts inconsistent with the provisions of this act are hereby repealed.

SECTION 2. That no claim agent or attorney shall be recognized in the adjudication of claims under this act, nor shall any such person be entitled to receive any compensation whatever for services or pretended services in making applications thereunder.

In the Senate the bill was reported by Mr. Van Wyck, of Nebraska, from the Committee on Pensions, with an amendment increasing the allowance to minor children to four dollars per month. In Committee of the Whole, March 15 and 16, this amendment and another proposed by Mr. Van Wyck, pensioning an insane, idiotic,

or otherwise helpless minor child during the continuance of disability, were adopted, but they were afterward thrown out by the Senate. An amendment offered by Mr. Ingalls, of Kansas, providing for arrearages, and one offered by Mr. Butler, of South Carolina, for pensioning Mexican War veterans, were also rejected. The Senate then passed the House bill March 16, without a division. The President approved of the measure March 22, 1886.

March 1, 1886, Mr. Eldredge, of Michigan, moved to suspend the rules and pass the following bill for pensioning veterans of the Mexican War as reported from the Committee on Pensions :

Be it enacted, etc., That the Secretary of the Interior be and he is hereby authorized and directed to place the names of all the surviving officers, soldiers, and sailors who enlisted and served in the war with Mexico for any period during the years 1845, 1846, 1847, 1848, and were honorably discharged, and their surviving widows, on the pension-roll, at the rate of \$8 per month, from and after the passage of this act, during their lives.

SECTION 2. That the Secretary of the Interior is authorized and directed to make such rules and regulations as are necessary to carry this act into effect: *Provided*, That where it shall appear that a discharge is lost, secondary evidence may be permitted; and where it shall appear an applicant has received a land-warrant, that shall be sufficient evidence of an honorable discharge, unless the evidence shows that he procured it by fraud: *And provided further*, That this act shall not apply to persons under political disabilities.

April 5, the motion was carried by the following vote :

YEAS—C. H. Allen, C. M. Anderson, Baker, Ballantine, Barbour, Barksdale, Barnes, Barry, Beach, Bennett, Blanchard, Bland, Bound, Boyle, Brady, C. R. Breckinridge, W. C. P. Breckinridge, Burnes, Bynum, J. E. Campbell, Candler, Catchings, Clardy, Clements, Cobb, Cole, Conger, Cooper, Cowles, Cox, Crain, Crisp, Croxton, Curtin, A. C. Davidson, R. H. M. Davidson, Dibble, Dockery, Eden, Eldredge, Ellsberry, Farquhar, Findlay, Fisher, Fleeger, Foran, Ford, Forney, Fuller, Funston, Gay, Geddes, C. H. Gibson, Glass, Glover, Goff, R. S. Green, W. J. Green, Hale, Hall, Halsell, Hatch, Hayden, Heard, D. B. Henderson, J. S. Henderson, Henley, Herbert, Herman, Hiestand, Hill, Holman, Holmes, Howard, Hutton, Irion, J. T. Johnston, T. D. Johnston, J. H. Jones, J. T. Jones, King, Kleiner, Laird, Landes, Lanham, Lawler, Le Fevre, Lore, Lovering, Lowry, Markham, Martin, Matson, McAdoo, McCreary, McMillin, McRae, Morrill, Morrow, Murphy, Neal, Neece, Negley, Nelson, O'Ferrall, O'Hara, J. J. O'Neill, Owen, Payson, Peel, Peters, Plum, Randall, J. W. J. Stone of Kentucky, Strait, Struble, Tarsney, I. H. Taylor, Zachary Taylor, J. R. Thomas, Throckmorton, Townshend, Trigg, Van Eaton, Van Schaick, T. B. Ward, Weber, West, Winans, Wise, Woodburn—99.

In the Senate, May 18, 1886, Mr. Blair, of New Hampshire, reported the following substitute from the Committee on Pensions :

Be it enacted, etc., That the Secretary of the Interior be and he is hereby authorized and directed to place on the pension-roll the names of the surviving officers and enlisted men, including marines, militia, and volunteers, of the military and naval services of the United States, who, being duly enlisted, actually served sixty days with the Army or Navy of the United States in Mexico, or on the coast or frontier thereof, or *en route* thereto, in the war with that nation, or were actually engaged in a battle in said war, and were honorably discharged, and to such other officers and soldiers and sailors as may have been personally named in any resolution of Congress for any specific service in said war, and the surviving widows of such officers and enlisted men: *Provided*, That such widows have not remarried: *Provided*, That every such officer, enlisted man, or widow who is or may become sixty-two years of age, or who is or may become subject to any disability or dependency equivalent to some cause prescribed or recognized by the pension laws of the United States as a sufficient reason for the allowance of a pension, shall be entitled to the benefits of this act; but it shall not be held to include any person not within the rule of age or disability or dependency herein defined, or who incurred such disability while in any manner voluntarily engaged in or aiding or abetting the late rebellion against the authority of the United States.

SECTION 2. That pensions under section 1 of this act shall be at the rate of \$8 per month, and payable only from and after the passage of this act, for and during the natural lives of the persons entitled thereto, or during the continuance of the disability for which the same shall be granted: *Provided*, That section 1 of this act shall not apply to any person who is receiving a pension at the rate of \$8 per month or more, nor to any person receiving a pension of less than \$8 per month, except for the difference between the pension now received (if less than \$8 per month) and \$8 per month.

SEC. 3. That before the name of any person shall be placed on the pension-roll under this act proof shall be made, under such rules and regulations as the Secretary of the Interior may prescribe, of the right of the applicant to a pension; and any person who shall falsely and corruptly take any oath required under this act shall be deemed guilty of perjury; and the Secretary of the Interior shall cause to be stricken from the pension-roll the name of any person whenever it shall be made to appear by proof satisfactory

to him that such name was put upon such roll through false and fraudulent representations, and that such person is not entitled to a pension under this act. The loss of the certificate of discharge shall not deprive any person of the benefits of this act, but other record evidence of enlistment and service and of an honorable discharge may be deemed sufficient: *Provided*, That when any person has been granted a land-warrant, under any act of Congress, for and on account of service in the said war with Mexico, such grant shall be *prima facie* evidence of his service and honorable discharge; but such evidence shall not be conclusive, and may be rebutted by evidence that such land-warrant was improperly granted.

Sec. 4. That the pension laws now in force, which are not inconsistent or in conflict with this act, are hereby made a part of this act, so far as they may be applicable thereto.

Sec. 5. That section 4716 of the Revised Statutes is hereby repealed, so far as the same relates to this act, or to pensioners under this act.

Sec. 6. That the provisions of this act shall not apply to any person while under the political disabilities imposed by the fourteenth amendment to the Constitution of the United States.

July 12 this measure was passed by the Senate without a division. The section of the Revised Statutes to be repealed by section 5 of this act forbids the payment of any money, on account of pensions, to any person engaged in the late rebellion against the Government, or to the widow, children, or heirs of such person deceased. July 13, the Senate bill as passed was referred to the House Committee on Pensions, and no further action was taken.

In the Senate, by a vote of 34 to 14, a bill was passed May 18, 1886, entitled "A bill for the relief of soldiers of the late war, honorably discharged after three months' service, who are disabled and dependent upon their own labor for support, and of dependent parents of soldiers who died in the service, or from disabilities contracted therein." It provides that every person specified in the several classes enumerated in section 4693 of the Revised Statutes, who served either in the land or naval forces of the United States during the war of the rebellion for a period of three months, shall receive a pension, in case he has become disabled without any fault of his own, and is dependent upon his own labor for support, or upon the contributions of others not legally bound thereto; that after due proof of such disability he shall be placed on the pension-list, receiving a pension proportionate to the degree of such disability, the highest rate of pension being \$24 a month for total incapacity, and no rate lower than \$4 being granted; that no person entitled to an invalid pension, or receiving such pension under the general act to a greater amount than that provided for in the special act shall receive the benefit of the latter; that the dependency of parents shall be considered established by the fact that they are without means of comfortable support other than their own labor or the contributions of those not legally bound thereto; that the fact of regular enlistment and mustering into the service shall be conclusive evidence of soundness at the time of enlistment, unless in

cases of fraud; that no person shall be entitled to more than one pension at a time, unless the act under which a second pension is claimed shall make a special declaration to that effect. The debate on the measure ran in the usual lines of such discussion. In the House, June 15, a substitute for the Senate bill was reported from the Committee on Pensions. It provides for a pension at the rate of \$12 a month for total inability to earn a subsistence, on the part of an honorably discharged soldier or sailor who served in the war of the rebellion for three months, on condition that the disability be not due to gross carelessness or vicious habits. It also imposes restrictions in regard to the fees to be collected by agents and attorneys. With the introduction of the substitute the matter rested.

May 25, 1886, the Senate passed without a division a bill granting, for the loss of a hand or foot or total disability therein, a pension of \$30 a month; for the loss of an arm at or above the elbow, and a leg at or above the knee, \$36 a month; for the loss of an arm at the shoulder, or a leg at the hip-joint, \$45. The bill was favorably reported in the House, only a mere verbal amendment being offered by the Committee on Invalid Pensions. Aug. 2, the House passed the measure, which the President approved.

June 18, 1886, the Senate passed without a division a bill increasing the rate of pensions to minor children from \$2 to \$4. No action was taken in the House.

May 5, 1886, Mr. Laird, from the Committee on Military Affairs, reported a bill providing that, in cases where re-enlisted veterans in the late war had been discharged, to receive promotion, they shall be paid full veteran bounty; that in cases where men prior to re-enlistment were discharged to receive commissions, they shall be entitled to whatever bounty they should have received if they had served out their regular term of enlistment; that soldiers honorably discharged on account of disease shall receive the same bounty as those honorably discharged on account of wounds; that any deductions made in the settlement with men of either class shall be refunded; and that in case of the death of any person entitled to the benefit of the act, his widow, heir, or legal representative shall be entitled to the sum due to him. Various amendments were suggested, and a whole day was wasted in filibustering to prevent progress. Subsequently the measure did not come up for consideration.

June 22, 1886, Mr. Morrison, from the Committee on Rules, reported a new rule providing that, whenever a bill was introduced to raise rates or amounts of pensions or add new clauses to the pension-lists, it should be in order to move to amend so as to provide by taxation or otherwise for the increased expense, the fund so provided not to be applied to any other purpose. A motion to lay the proposed rule on the table failed by a vote of 127 to 139,

the negative vote being exclusively Democratic and only a few Democrats voting in the affirmative. June 23, on the question of considering the rule, the vote stood 132 to 116; but the Republicans prevented a final vote by filibustering.

Congress passed 747 pension bills, of which the President approved 491, while 154 became laws without signature, 101 were vetoed, and one remained unsigned at the time of adjournment. The private pension bills vetoed by the President were the subject of much warm discussion. Many of the veto messages were severe, impugning the action of Congress and the motives of the pension-seekers; and in every case where bills originated in the Senate and in some where they originated in the House, the Committees on Pensions made reports setting forth facts to show that the President had acted under a misapprehension. In several cases attempts were made to pass special pension bills over the President's veto, and though a majority in Senate and House seemed disposed to do so, there was only one case, that of Joseph Romiser, in which the veto was overridden. The vote on the re-passage of the bill in the House was 175 to 38, and the vote in the Senate 50 to 0.

Labor Questions.—May 9, 1886, by a vote of 251 to 8, the House passed a bill prohibiting the letting out on contract of the labor of criminals incarcerated in any prison for violation of any of the laws of the United States, making such letting out of prison-labor a misdemeanor punishable by imprisonment for from one to three years, or a fine of from \$500 to \$1,000, for each offense. In the Senate the measure did not progress beyond a reference to a committee.

In the Senate, June 1, 1886, Mr. Miller, of New York, moved to consider the bill making eight hours a day's labor for letter-carriers, and declaring that there shall be no reduction of their wages on account of the limitation of their hours of labor. The bill was taken up and passed without a division. It did not come to a vote in the House.

In the House, April 3, 1886, the Committee on Labor reported a bill "to provide a method for settling controversies and differences between railroad corporations engaged in interstate and territorial transportation of property or passengers and their employés." The bill provided that, in cases where a difference occurs between such a railroad as described in the title and its employés, which difference may hinder, impede, or obstruct the transportation of property or passengers, upon written agreement to submit the difference to arbitration the railroad company shall choose one arbitrator and the employés another, both of whom shall select a third, the three together to constitute a board of arbitration. The arbitrators are to act under oath, and to have power to summon witnesses, compel attendance, examine books and papers, with authority akin

to that of United States commissioners. A majority of the board may give an award; and the board is to organize, at a point as near as possible to the origin of the difficulty, and hear and determine the matters of difference submitted to them, receiving statements from the parties, examining them on oath, and allowing them the advantage of counsel. The award, when made, is to be filed with the United States Commissioner of Labor Statistics. Any employés engaged in such controversy shall be entitled to choose one or more persons to represent them either in selecting an arbitrator or before the board. Allowances are made for the payment of arbitrators, witnesses, and marshals engaged in the settlement of the controversy, the expenses in no single case to exceed \$1,000. The measure was debated at length in the House. It was criticised by conservative members as unconstitutional; the labor-men objected to it as worthless. Mr. Foran, of Ohio, said in their behalf:

"Without stopping to inquire into the constitutionality of such a law, the principle involved is so abhorrent to every sense of justice and right that I recoil from it with horror. I am not prepared to give the judges of the courts of the United States the right to imprison men for contempt, to coerce by the military arm of the Government men who are honestly contending for a principle they believe to be right. Compulsory arbitration would so fetter and shackle labor that its freedom and its right to organize for self-protection would eventually disappear. As to the bill now before the House, which is a substitute for the bill introduced by the gentleman from Missouri (Mr. O'Neill) yesterday, I am not prepared to say that I will vote against it; I may possibly vote for it, for the same reason that I would drink a glass of water—it might do me no good, but it would certainly do me no harm. It will injure nobody to pass this bill; we may safely vote for it. If it will not benefit labor, it certainly will not injure it. It is a very harmless measure, but there is no arbitration in it. There is less of the principle of arbitration in this bill than there is flesh upon the dried and bleached bones of a doctor's anatomical skeleton. The gentleman from Pennsylvania (Mr. Kelley) thinks some one may be deceived by it. I think that is hardly possible."

"The trouble with this bill is it accomplishes nothing because it provides for nothing that does not now exist. Take the present difficulty in the Southwest, for instance. Suppose this bill was in force as a law when that trouble arose, and the Knights of Labor submitted to Mr. Gould a proposition to arbitrate the matters in controversy, would he have acceded? We know he would not. He was asked to arbitrate, but refused. If he now partially consents to such a course, it is because he has become convinced that it is to his interest to do so, not because he favors the principle of arbitration or because he has any love for the

Knights of Labor. But suppose you pass this bill, what do you accomplish?

"If both parties to a controversy agree to arbitrate under its provisions, the board for which it provides becomes a board of investigation and inquiry. It can publish its findings of fact and give its opinion as to who is right or who is wrong. And there it stops; it can go no further. This might be of some utility and benefit if in every case of controversy the investigation could be had. But either party can refuse to be investigated. Then what does the bill accomplish that may not be accomplished without it? But suppose the board is appointed and the investigation had, the corporation can ignore its findings and sneer at its recommendations. But it will be claimed that an enlightened public opinion will force the party in the wrong to respect that opinion and accede to its judgment. If this be true, then the bill should be so perfected as to compel the investigation, not the arbitration, in every instance."

In favor of the measure, Mr. Long, of Massachusetts, said :

"I am for this bill because it is by no means so valueless as has been represented. It has other virtues than the virtue of being merely harmless. The bill is a positive force. It does something more than simply declare, what is already true, that one man having a grievance against another may enter into an arbitration over it with him if both agree to do so. What I say is this: If, without this law, any humble employé of a powerful railroad corporation should to-day ask that corporation to enter into an arbitration with him over a difference between them, the chances, as you know, are a hundred to one that in any ordinary case the corporation would decline and would wave him away. You also know—such is the power of the expression of the representatives of the people, such is the power of an act of the American Congress—that if you pass this bill, then let the humblest workingman demand of the corporation that employs him an arbitration, let him demand it under the sanction of an act of Congress, and the chances are a hundred to one that it will be granted, or that, to avoid refusing it, an adjustment will be made. In that way you insure to him a hearing; and let me say—and I say this to the credit of the wisdom of the Committee on Labor—you insure it to him pretty much as substantially as if you had put a compulsory provision into the bill.

"Pass this bill with this fifth section in it, and you provide that the employé, however poor, engaging in an arbitration of this character shall have the expense of his arbitrators, of his witnesses, of the clerk, of the stenographer—all the expenses of the arbitration—paid out of the United States Treasury. And let me tell you it will be a mighty cheap price to pay if it will tend to avoid such an experience as we have had within the last few weeks in

the State of Missouri, with the attendant damage and loss that have followed from it to all classes of the community. Pass the bill with this section, and you have put the humblest workingman upon an equality in this respect with the richest employer. There is no longer anything to prevent the hearing of any matter in dispute without oppressive expense to one side or the other and upon fair and equal terms. The result will be not the multiplicity of these complaints or suits, but their infrequency. The very power to invoke arbitration will prevent its invocation, as every man who is familiar with human nature knows, because the party in the wrong will sooner do justice than have that power invoked, and because no man who has not a good cause of complaint will be in a hurry to have its weakness and fallacy exposed to the light of an investigating arbitration.

"I am for this bill, then, because it is on the whole a good bill, and especially because it is a temperate bill; because it does not undertake too much; because, while it meets public sentiment, it goes only as far as public sentiment has now gone. It opens the door to peaceful adjustment of difficulties. It turns the minds of the people in the direction of adjudication, and not in the direction of revolution or violence. It works no harm. It accomplishes a good purpose. The committee are entitled to credit for having brought it here in so moderate a form, and I trust we shall pass it as they have presented it to us."

April 3, the bill passed by a vote of 199 to 30. It was brought up for discussion in the Senate, but did not come to a final vote.

On the subject of arbitration, the President sent to Congress the following message :

To the Senate and House of Representatives:

The Constitution imposes upon the President the duty of recommending to the consideration of Congress from time to time such measures as he shall judge necessary and expedient.

I am so deeply impressed with the importance of immediately and thoughtfully meeting the problem which recent events and a present condition have thrust upon us, involving the settlement of disputes arising between our laboring-men and their employers, that I am constrained to recommend to Congress legislation upon this serious and pressing subject.

Under our form of government the value of labor as an element of national prosperity should be distinctly recognized, and the welfare of the laboring-man should be regarded as especially entitled to legislative care. In a country which offers to all its citizens the highest attainment of social and political distinction its workingmen can not justly or safely be considered as irrevocably consigned to the limits of a class and entitled to no attention and allowed no protest against neglect.

The laboring-man, bearing in his hand an indispensable contribution to our growth and progress, may well insist, with manly courage and as a right, upon the same recognition from those who make our laws as is accorded to any other citizen having a valuable interest in charge; and his reasonable demands should be met in such a spirit of appreciation and fairness as to induce a contented and patriotic co-operation in the achievement of a grand national destiny.

While the real interests of labor are not promoted by a resort to threats and violent manifestations, and while those who under the pretext of an advocacy of

the claims of labor wantonly attack the rights of capital, and for selfish purposes or the love of disorder sow seeds of violence and discontent, should neither be encouraged nor conciliated, all legislation on the subject should be calmly and deliberately undertaken, with no purpose of satisfying unreasonable demands or gaining partisan advantage.

The present condition of the relations between labor and capital are far from satisfactory. The discontent of the employed is due in a large degree to the grasping and heedless exactions of employers and the alleged discrimination in favor of capital as an object of governmental attention. It must also be conceded that the laboring-men are not always careful to avoid causeless and unjustifiable disturbance.

Though the importance of a better accord between these interests is apparent, it must be borne in mind that any effort in that direction by the Federal Government must be greatly limited by constitutional restrictions. There are many grievances which legislation by Congress can not redress, and many conditions which can not by such means be reformed.

I am satisfied, however, that something may be done under Federal authority to prevent the disturbances which so often arise from disputes between employers and the employed, and which at times seriously threaten the business interests of the country; and, in my opinion, the proper theory upon which to proceed is that of voluntary arbitration as the means of settling these difficulties.

But I suggest that instead of arbitration chosen in the heat of conflicting claims, and after each dispute shall arise, there be created a commission of labor, consisting of three members, who shall be regular officers of the Government, charged among other duties with the consideration and settlement, when possible, of all controversies between labor and capital.

A commission thus organized would have the advantage of being a stable body, and its members, as they gained experience, would constantly improve in their ability to deal intelligently and usefully with the questions which might be submitted to them. If arbitrators are chosen for temporary service as each case of dispute arises, experience and familiarity with much that is involved in the question will be lacking, extreme partisanship and bias will be the qualifications sought on either side, and frequent complaints of unfairness and partiality will be inevitable. The imposition upon a Federal court of a duty so foreign to the judicial function as the selection of an arbitrator in such cases is at least of doubtful propriety.

The establishment by Federal authority of such a bureau would be a just and sensible recognition of the value of labor, and of its right to be represented in the departments of the Government. So far as its conciliatory offices shall have relation to disturbances which interfere with transit and commerce between the States, its existence would be justified under the provisions of the Constitution which gives to Congress the power "to regulate the commerce with foreign nations and among the several States." And in the frequent disputes between the laboring-men and their employers, of less extent, and the consequences of which are confined within State limits and threaten domestic violence, the interposition of such a commission might be tendered upon the application of the Legislature or Executive of a State, under the constitutional provision which requires the General Government to "protect" each of the States "against domestic violence."

If such a commission were fairly organized the risk of loss of popular support and sympathy resulting from a refusal to submit to so peaceful an instrumentality would constrain both parties to such disputes to invoke its interference and abide by its decisions. There would also be good reason to hope that the very existence of such an agency would invite application to it for advice and counsel, frequently resulting in the avoidance of contention and misunderstanding.

If the usefulness of such a commission is doubted because it might lack power to enforce its decisions, much encouragement is derived from the conceded good that has been accomplished by the railroad commissions which have been organized in many of the States, which, having little more than advisory power, have exerted a most salutary influence in the settlement of disputes between conflicting interests.

In July, 1884, by a law of Congress, a Bureau of Labor was established and placed in charge of a Commissioner of Labor, who is required to collect information upon the subject of labor, its relations to capital, the hours of labor, and the earnings of laboring men and women, and the means of promoting their material, social, intellectual, and moral prosperity.

The commission which I suggest could easily be grafted upon the bureau thus already organized by the addition of two more commissioners, and by supplementing the duties now imposed upon it by such other powers and functions as would permit the commissioners to act as arbitrators when necessary between labor and capital, under such limitations and upon such occasions as should be deemed proper and useful.

Power should also be distinctly conferred upon this bureau to investigate the causes of all disputes as they occur, whether submitted for arbitration or not, so that information may always be at hand to aid legislation on the subject when necessary and desirable.

GROVER CLEVELAND.

EXECUTIVE MANSION, April 22, 1886.

June 9, 1886, the following bill, for incorporating national trades-unions, passed the Senate without a division:

Be it enacted, etc., The term "National Trade-Union," in the meaning of this act, shall signify any association of working-people having two or more branches in the States or Territories of the United States for the purpose of aiding its members to become more skillful and efficient workers; the promotion of the general intelligence; the elevation of their character; the regulation of their wages and their hours and conditions of labor; the protection of their individual rights in the prosecution of their trade or trades; the raising of funds for the benefit of the sick, disabled, or unemployed members, or the families of deceased members; or for such other object or objects for which working-people may lawfully combine, having in view their mutual protection or benefit. . .

SECTION. 3. That national trade-unions shall, upon filing their articles of incorporation in the office of the recorder of the District of Columbia, become a corporation under the technical name by which said national trade-union desires to be known to the trade, and shall have the right to sue and be sued, to implead and be impleaded; to grant and receive in its corporate or technical name, property, real, personal, and mixed, and to use said property, and the proceeds and income thereof, for the objects of said corporation as in its charter defined: *Provided*, That each incorporated union may hold only so much real estate as may be necessary for the purposes of the corporation.

SEC. 4. That an incorporated national trade-union shall have power to make and establish such constitution, rules, and by-laws, as it may deem proper to carry out its lawful objects and the same to alter, add to, or repeal at pleasure.

SEC. 5. That an incorporated national trade-union shall have power to define the duties and powers of all its officers, and prescribe their mode of election and term of office; to establish branches and sub-unions in any Territory of the United States.

SEC. 6. That the headquarters of an incorporated national trade-union shall be located in the District of Columbia.

June 11, this measure passed the House without a division, and on June 29 it was approved by the President.

Land-Grant Forfeitures.—A bill forfeiting public lands granted in 1856 and 1857, in aid of railroads in Alabama, Mississippi, and Louisiana, except so far as covered by the grant in aid of a railroad from Jackson, Miss., to the State line between Mississippi and Alabama, and a railroad from Brandon to the Gulf of Mexico, was passed by both Houses of Congress, and approved July 12, 1886.

Both houses of Congress also passed a bill restoring to the public domain lands granted in the act of July 27, 1866, and subsequent amendments, to aid in building a railroad from Missouri and Arkansas to the Pacific coast, excepting the right of way and the right to take building material from the adjacent public lands.

The House passed a bill for adjusting land-grants to railroads in Kansas, but no vote was taken on the subject in the Senate.

The Senate passed a bill to forfeit part of certain lands granted to railroads in Iowa; but no final action was taken on the subject in the House.

The House passed a bill to declare a forfeiture of the lands granted to the New Orleans, Baton Rouge, and Vicksburg Railroad Company.

June 15, the Senate, by a vote of 42 to 1, passed a bill restoring to the public domain land granted by the act of July 2, 1864, and subsequent acts, to the Northern Pacific Railroad which appertain to and are conterminous with that part of the main line extending from Wallula Junction, in Washington Territory, to Portland, Oregon, except the lands along the branch across the Cascade Mountains, where that road had been constructed at the time of the passage of the act. The House adopted a substitute declaring forfeited all lands granted to the Northern Pacific Railroad by the act of July 2, 1866, except such as were granted for portions of the road completed July 4, 1879, the right to land necessary for operating the road, and land in village, town, and city sites. The vote in favor of the substitute was 174 to 65, and the bill was passed by a vote of 187 to 47. The two houses of Congress failed to come to an agreement on the subject.

The forfeitures of land-grants made in the Forty-eighth Congress amounted to 19,610,880 acres. Those made in the first session of the Forty-ninth Congress amounted to 30,871,360 acres. There is pending between the two houses the Northern Pacific forfeiture, which, under the Senate bill, covers 6,170,640 acres, and, under the House substitute, 36,907,741 acres. The House also passed forfeitures amounting to 1,523,200 acres, and there are pending on its calendars forfeitures amounting to 13,067,214 acres.

The Treasury Surplus.—July 14, 1886, the House took up a joint resolution on this subject, reported by Mr. Morrison, of Illinois, from the Committee on Ways and Means:

Resolved, etc., That whenever the surplus or balance in the Treasury, including amount held for redemption of United States notes, shall exceed the sum of \$100,000, it shall be and is hereby made the duty of the Secretary of the Treasury to apply such excess in sums not less than \$10,000,000 per month, during the existence of any such surplus or excess, to the payment of the interest-bearing indebtedness of the United States, payable at the option of the Government. The surplus or balance herein referred to shall be the available surplus ascertained, according to the form of statement of the United States Treasurer, of the assets and liabilities of the Treasury of the United States, employed on June 30, 1886.

This resolution passed by a vote of 207 to 67. The Senate amended the resolution by adding a proviso that no call shall be made until an amount equal to it is in the Treasury over and above the reserve stated; that the Secretary may keep an additional working balance of \$20,000,000; and that in any emergency, when the public interest, in the opinion of the President, seems to require such a course, he may, by a written order, suspend further calls. Sections were added making trade-dollars receivable at their face value by the Government, and forbidding their reissue in any shape. The amended resolution was passed by the Senate July 30, and August 3 a conference committee agreed on a report which added to the resolution as passed by the House the following proviso:

Provided, That no call shall be made under the provisions of this resolution until a sum equal to the call is in the Treasury over and above the reserve herein mentioned: *And provided further*, That the Secretary of the Treasury, in his discretion, may have in the Treasury over and above the foregoing sums a working balance not exceeding \$20,000,000; and whenever in the case of any extraordinary emergency, not now existing, and when, because thereof, in the opinion of the Secretary of the Treasury, the public interest shall require it, he may, by written order, postpone the further call for the payment of such indebtedness for such period of time as shall be necessary to maintain the public credit unimpaired; and that such postponement and the reasons therefor shall be reported to Congress within ten days after its next meeting, or immediately, if Congress be in session.

National Aid to Common Schools.—Jan. 6, 1886, Mr. Blair, of New Hampshire, reported from the Committee on Education and Labor, to which it had been referred, his bill to aid in the establishment and temporary support of common schools. The measure was substantially the same as that which passed the Senate at the first session of the Forty-ninth Congress, and was given in the "Annual Cyclopædia" for 1884. It provides for the distribution of the sum of \$77,000,000 in eight years among the States and Territories for educational purposes in proportion to the illiteracy in each—\$7,000,000 the first year; \$10,000,000 the second year; \$15,000,000 the third year; \$13,000,000 the fourth year; \$11,000,000 the fifth year; \$9,000,000 the sixth year; \$7,000,000 the seventh year, and \$5,000,000 the eighth year. To share in these appropriations, each State and Territory, through its Legislature, must accept the provisions of the act; and no State

or Territory will be considered eligible that has not provided a free common-school system, full details in regard to which must be filed by the Governor with the Secretary of the Interior. In no case is the amount granted to any State or Territory to be greater for any one year than the sum spent by that State or Territory for the support of its schools during the previous year. Part of the grant may be spent in the education and training of teachers, but none of it in the erection of school-buildings; for that purpose a special fund of \$2,000,000 is provided for the construction of school-houses in poor districts, but in no case is the amount granted for building a school-house to be more than \$150, or half the cost of the structure. The debate on the measure was long, and several elaborate arguments for and against it were presented; but the line of discussion was the same as that followed in the Forty-eighth Congress. March 5, the Senate passed the bill by the following vote:

YEAS—Berry, Blackburn, Blair, Bowen, Call, Colquitt, Conger, Cullom, Dolph, Eustis, Evarts, George, Gibson, Hoar, Jackson, Jones of Arkansas, Kenna, Logan, Mahone, Manderson, Miller of New York, Mitchell of Oregon, Morrill, Palmer, Payne, Pugh, Ransom, Riddleberger, Sawyer, Spooner, Teller, Vance, Van Wyck, Voorhees, Walthall, Wilson of Iowa—36.

NAYS—Cockrell, Coke, Fry, Gray, Hale, Harris, Ingalls, Jones of Nevada, Maxey, Plumb, Wilson of Maryland—11.

ABSENT—Aldrich, Allison, Beek, Brown, Butler, Camden, Cameron, Chace, Dawes, Edmunds, Fair, Gorman, Hampton, Harrison, Hawley, Jones of Florida, McMillan, McPherson, Miller of California, Mitchell of Pennsylvania, Morgan, Pike, Platt, Sabin, Saulsbury, Sewell, Sherman, Stanford, Vest—29.

In the House, March 9, the Senate bill was referred to the Committee on Education; March 29 a measure identical with it was introduced by Mr. Willis, of Kentucky, and referred to the Committee on Labor, the majority of which reported it back, April 27, with a substitute providing that the sales of the public lands for ten years be distributed among the States and Territories for educational purposes, the expenditure not to exceed \$7,500,000 in any single year. No further action was taken.

Inter-State Commerce.—As usual for years much of the attention of Congress was occupied by this subject; and, as usual, no final action was taken. In the Senate, on Feb. 16, 1886, Mr. Cullom, of Illinois, from a Select Committee on Inter-State Commerce, reported a bill which was debated and amended, and passed the Senate May 12, by a vote of 46 yeas to 4 nays. The main features of this bill are, that it forbids unreasonable and unjust charges for transportation and discrimination between persons or localities, enjoins the publication of rates, and provides for a commission with authority to investigate the affairs of all common carriers and command direct compliance with the law, having the right to enforce their orders through petition to the United States courts. May 22, Mr. Reagan, of Texas, reported from the House Committee on Commerce a substitute for the

Senate bill. His measure simply declares what it shall be unlawful for common carriers to do, and certain things which they must do, making them liable to a suit for damages brought by any person injured through their acts or omissions, and declaring the violation of the terms of the law a misdemeanor. July 30, the House by a vote of 134 yeas to 104 nays substituted Mr. Reagan's bill for the Senate bill, and then passed the measure by a vote of 192 to 40. The Senate non-concurred in the House amendment, and July 31 a committee of conference was appointed, but no agreement was reached. The rival measures are substantially the same as those brought forward in the Forty-eighth Congress and given in the "Annual Cyclopaedia" for 1885.

National Bank Associations.—Feb. 11, 1886, Mr. Adams, of Illinois, from the Committee on Banks and Currency, reported the following measure in the House of Representatives:

Be it enacted, etc., That any national banking association may, with the approval of the Comptroller of the Currency, by the vote of shareholders owning two thirds of the stock of such association, increase its capital stock, in accordance with existing laws, to any sum approved by the said Comptroller, notwithstanding the limit fixed in its original articles of association and determined by said Comptroller; and no increase of the capital stock of any national banking association either within or beyond the limit fixed in its original articles of association shall be made except in the manner herein provided.

SECTION 2. That any national banking association may change its name or the place where its operations of discount and deposit are to be carried on, with the approval of the Comptroller of the Currency, by the vote of shareholders owning two thirds of the stock of such association. A duly authenticated notice of the vote and of the new name or location selected shall be sent to the office of the Comptroller of the Currency; but no change of name or location shall be valid until the Comptroller shall have issued his certificate of approval of the same.

SEC. 3. That all debts, liabilities, rights, provisions, and powers of the association under its old name shall devolve upon and inure to the association under its new name.

SEC. 4. That nothing in this act contained shall be so construed as in any manner to release any national banking association under its old name or at its old location from any liability, or affect any action or proceeding in law in which said association may be or become a party or interested.

The measure passed the House by a vote of 130 to 120. The Senate amended it so as to limit the change of location to any place in the same State not more than thirty miles distant, and then passed it without a division. It was approved by the President April 30.

Miscellaneous.—The River and Harbor bill passed by Congress was an unusually heavy one, as it appropriated \$14,473,900.

April 13, 1886, the Senate passed, by a vote of 35 to 10, a resolution declaring that Congress ought not to provide for the appointment of a commission, on which the Governments of the United States and Great Britain should be represented, to consider the fishing rights of the United States and British North America, and settle points in dispute.

April 15, 1886, on motion of Mr. Breckinridge, of Kentucky, the following bill was passed by the House without a division:

Be it enacted, etc., That section 3336 of the Revised Statutes of the United States be and is hereby amended so as to read as follows:

SECTION 3336. Every brewer, on filing notice as aforesaid of his intention to commence or continue business, shall execute a bond to the United States, to be approved by the collector of the district, in a sum equal to three times the amount of the tax which, in the opinion of the collector, said brewer will be liable to pay during any one month, and conditioned that he shall pay, or cause to be paid, as herein provided, the tax required by law on all beer, lager-beer, ale, porter, and other fermented liquors made by or for him, before the same is sold or removed for consumption or sale, except as hereinafter provided; and that he shall keep, or cause to be kept, a book, in the manner and for the purposes hereinafter specified, which shall be open to inspection by the proper officers, as by law required; and that he shall in all respects faithfully comply, without fraud or evasion, with all requirements of law relating to the manufacture and sale of any malt liquors aforesaid; and he shall execute a new bond, whenever required so to do by said collector, in the amount above named and conditioned as above provided, which bond shall be in lieu of any former bond or bonds of such brewer in respect to all liabilities accruing after its approval by said collector.

In the Senate the measure was amended by providing that the bond referred to in the last clause be executed "once in four years," and whenever required, etc., and was then passed, April 26, by a vote of 27 to 19. The House concurred in the Senate amendment April 27, and the President approved the bill May 5.

June 1, the Senate passed, without a division, a bill providing that no alien and no foreign corporation shall hereafter hold land in any Territory of the United States or the District of Columbia, except such as may be acquired by devise or inheritance, or in good faith in the ordinary course of justice in the collection of debts, and also except in cases where existing bodies grant to the subjects of a foreign power the right to hold lands in the United States. The bill also provides that no corporation, 20 per cent. of whose stock is owned by foreigners, shall hold lands, and that no corporation except those for the construction and operation of railways, canals, or turnpikes, shall hold more than 5,000 acres of land acquired hereafter in any of the Territories; and no railway, canal, or turnpike shall hold more land than is required for its business, except in cases where land is granted by act of Congress. In the House, July 31, the Committee on Public Lands reported a substitute, limiting the foreign ownership of stock in corporations owning land in the Territories to 10 per cent., and forbidding foreign acquisition of title by any means, but excepting from the scope of the act corporations for the construction and operation of railroads. This measure passed the House by a vote of 209 to 6. The measure was made the subject of conference between the houses, and no final decision was reached.

In regard to a fortification bill, the two houses disagreed, and nothing was done in

regard to the construction or armament of sea-coast defenses.

To strengthen the navy, Congress passed a bill authorizing the President to have constructed two sea-going double-armored vessels, of about 6,000 tons displacement, with speed of 16 knots an hour, to cost, exclusive of armament, not more than \$2,500,000, both to have a complete torpedo outfit. Also, one protected double-bottomed cruiser, of not less than 3,500 nor more than 5,000 tons displacement, to cost, including engines and machinery, and excluding armament, not exceeding \$1,500,000; also, a first-class torpedo-boat, at a cost of \$100,000; also, to complete the double-turreted monitors "Puritan," "Amphitrite," "Monadnock," and "Terror," at a total cost not exceeding \$3,178,046. And the sum of \$1,000,000 was appropriated for the armament of the new vessels, the "Miantonomoh" and the unfinished monitors.

In the Sundry Civil Appropriation bill Congress provided for the issue of silver certificates of one, two, and five dollar denominations, in lieu of certificates of larger denominations.

Both houses passed bills for the repeal of the pre-emption, timber-culture, and desert-land laws, but, as no agreement could be reached in conference, the result remained undecided.

A bill was introduced in the Senate by Mr. Beck, of Kentucky, forbidding any member of Congress to accept employment as an attorney or payment for services of any kind from any railroad that obtained its charter grants of land, or pecuniary aid from the United States, and making the violation of the law a misdemeanor. The bill passed the Senate June 10, 1886, by a vote of 37 to 11, but was reconsidered June 23 by a vote of 31 to 21, and referred to the Judiciary Committee, and Mr. Hoar reported from that body a substitute extending the application of the bill so as to make it absurd. Its consideration was postponed.

April 8, 1886, the House, by a vote of 163 to 126, rejected a bill for the free coinage of silver.

No vote was reached on the bill for counting the electoral vote.

Jan. 8, 1886, a bill supplementary to the act for the suppression of bigamy passed the Senate by a vote of 38 to 7; but in the House no action was taken beyond reporting a substitute.

The following measures not noticed in detail were passed:

To provide that manufactured tobacco, snuff, and cigars may be removed for export without payment of tax, and repealing the law providing for inspectors of tobacco.

To provide that homestead settlers within the railway limits restricted to less than 160 acres of land shall be entitled to have their additional entries patented without any further cost or further proof of settlement and cultivation.

To remove the charge of desertion against soldiers who re-enlisted without having first

received a discharge from the regiments in which they had previously served.

Authorizing the construction of a building for the accommodation of the Congressional Library.

Providing that after July 1, 1886, no fees shall be charged to American vessels for measurement of tonnage, issuing of licences, granting of certificates of registry, etc., and amending the laws relative to the shipping and discharging of crews, the liability of owners of vessels, the licensing of vessels, etc.

To provide that surveyed lands granted to railroads conterminous with completed portions of such roads, and in organized counties, shall not be exempt from local taxation on account of the lien of the United States upon them for the costs of surveying, selecting, or conveying them; also making provision for selling such lands on the refusal or neglect of the companies to pay costs of survey.

To give the receiver of a national bank the power to buy in any property of the bank sold under foreclosure when necessary to protect his trust.

To reduce the fees on domestic money orders for sums not exceeding \$5, from eight cents to five cents.

To allow steam-towing vessels to carry, in addition to their crews, as many persons as the supervising inspector may authorize.

And a clause was inserted in the Agricultural Appropriation bill directing the Commissioner of Agriculture to purchase and destroy diseased animals whenever, in his judgment, it is essential to prevent the spread of pleuro-pneumonia from one State into another.

Constitutional Amendments.—More than the usual number of amendments to the Constitution of the United States were proposed in the Forty-ninth Congress:

Dec. 8, 1885, by Mr. Plumb, of Kansas, an amendment prohibiting forever the manufacture, importation, or sale of all distilled and fermented intoxicating liquors as a beverage.

Dec. 9, 1885, by Mr. Blair, of New Hampshire, an amendment declaring that the right of citizens to vote shall not be denied or abridged on account of sex.

Dec. 9, 1885, by Mr. Blair, of New Hampshire, an amendment forbidding the manufacture, sale, importation, or exportation of distilled alcoholic intoxicating liquors, except for medicinal, mechanical, chemical, and scientific purposes after the year 1900.

Dec. 15, 1885, by Mr. Jackson, of Tennessee, an amendment, making the presidential term six years, and declaring the President ineligible to re-election, and the Vice-President ineligible in cases where he has succeeded to the presidency.

Dec. 19, 1885, by Mr. Browne, of Indiana, an amendment providing for the election of President and Vice-President, and the counting of the electoral votes, based on the principle of allowing the people in each State to vote di-

rectly for President and Vice-President, and then apportioning the electoral vote of the State among the candidates according to the popular vote of each, multiplying the number of votes cast for any candidate by the number of electoral votes to which the State may be entitled, and dividing the product by the whole popular vote, and allowing each candidate the benefit of any fraction expressed within three decimal places.

Dec. 21, 1885, by Mr. Springer, of Illinois, an amendment providing that the presidential term shall be six years; that the President shall be ineligible to re-election; that the people of each State shall vote directly for candidates for President and Vice-President; and that the share of each in the electoral vote of a State shall be determined by dividing the popular vote cast in a State by the number of electoral votes to which it is entitled, to find a presidential ratio, and then dividing the vote cast for each candidate by this ratio to obtain the number of electoral votes to which he is entitled, the odd electoral votes to go to the candidate having the largest fraction. Also an amendment providing for holding congressional elections in November, and having the first session of the new Congress begin in the January following. Also an amendment prohibiting local, private, and special legislation by Congress.

Dec. 21, 1885, by Mr. Townshend, of Illinois, an amendment providing that the Senators of each State shall be elected by the people of the State.

Dec. 21, 1885, by Mr. Thomas, of Illinois, an amendment prohibiting bigamy or polygamy.

Dec. 21, 1885, by Mr. Payson, of Illinois, an amendment allowing the President to veto or approve separate items in appropriation bills.

Dec. 21, 1885, by Mr. Matson, of Indiana, an amendment enabling Congress to provide for the election of postmasters by the people.

Dec. 21, 1885, by Mr. Weaver, of Iowa, an amendment classifying the Senate so that one third of the Senators shall be chosen every two years directly by the people.

Dec. 21, 1885, by Mr. Blanchard, of Louisiana, an amendment forbidding the President, by and with the consent of the Senate, to make reciprocity treaties affecting the revenues until Congress, by a bill originating in the House of Representatives, agree to the proposed changes.

Jan. 5, 1886, by Mr. McComas, of Maryland, an amendment providing that the clause forbidding States to pass any law impairing the obligation of a contract shall not be construed as prohibiting States from taxing the capital stock or property of any corporation created by a State.

Jan. 5, 1886, by Mr. Collins, of Massachusetts, an amendment adding "nativity" to the causes on account of which the right of citizens of the United States to vote shall not be abridged by the action of any State.

Jan. 5, 1886, by Mr. Davis, of Massachusetts, an amendment granting Congress power to limit, by legislation, the hours of employment.

Jan. 5, 1886, by Mr. McAdoo, of New Jersey, an amendment appointing elections for presidential electors in each State to be held on the third Tuesday of October, and forbidding the holding of any State, municipal, or local election on that day.

Jan. 5, 1886, by Mr. Beach, of New York, an amendment prohibiting Congress from granting to any private corporation or individual any exclusive privilege, immunity, or franchise whatsoever. Also an amendment making the statute of limitations in each State apply to claims of citizens of that State against the United States. Also an amendment giving the President thirty days after the adjournment of Congress in which to act on bills passed by that body, and providing for the veto of separate items in appropriation bills. Also an amendment giving Congress power to establish uniform marriage and divorce laws throughout the United States. Also an amendment forbidding the loan or gift of the credit, money, or property of the United States to any association, corporation, or private undertaking.

Jan. 6, 1886, by Mr. Bayne, of Pennsylvania, an amendment providing for the election of postmasters, revenue-collectors, marshals, and district attorneys by the people of the States in which their duties are to be performed.

Jan. 6, 1886, by Mr. Randall, of Pennsylvania, an amendment giving the President power to veto separate items in appropriation bills.

Jan. 6, 1886, by Mr. Dibble, of South Carolina, an amendment providing for the election of a second Vice-President of the United States.

Jan. 6, 1886, by Mr. Reagan, of Texas, an amendment prescribing the method of levying direct taxes.

Jan. 6, 1886, by Mr. Throckmorton, of Texas, an amendment providing for the veto or approval of separate items in the River and Harbor bill.

Jan. 7, 1886, by Mr. Grout, of Vermont, an amendment providing that, in the case of post-offices, appointments to which are intrusted to the head of the Post-Office Department, no person shall be eligible unless recommended by a majority of the voters who are patrons of the office in question, acting in open meeting called to obtain the expression of their opinion.

Jan. 11, 1886, by Mr. Payne, of New York, an amendment providing for the veto or approval of separate items in appropriation bills.

Jan. 18, 1886, by Mr. Lovering, of Massachusetts, an amendment forbidding any State to let out by contract the labor of prisoners.

Jan. 18, 1886, by Mr. Crain, of Texas, amendments providing for the election of President, first Vice-President, second Vice-President, and third Vice-President, and to modify the Constitution to suit the new system.

Jan. 26, 1886, by Mr. Townshend, of Illinois, an amendment providing for the election of President and Vice-President by the direct vote of the people.

Feb. 8, 1886, by Mr. Little, of Ohio, an amendment providing for the election of President and Vice-President without the machinery of an electoral college, the electoral votes of each State being cast for the candidates receiving from the people of the State the greatest number of votes.

Feb. 8, 1886, by Mr. Springer, of Illinois, an amendment forbidding special legislation by Congress in cases where laws relating to the subject-matter are in force.

March 1, 1886, by Mr. Hill, of Ohio, an amendment providing for the election of the Senate every sixth year by the direct vote of the people of the several States.

March 8, 1886, by Mr. Seymour, of Connecticut, an amendment authorizing Congress to provide for bringing suits for claims against the United States.

March 15, 1886, by Mr. Ingalls, of Kansas, an amendment providing that the term of the present President and the Fiftieth Congress be prolonged until April 30, 1889, and that from that time on each presidential term and each new congressional term shall begin on the 30th of April instead of the 4th of March.

May 24, 1886, by Mr. Tucker, of Virginia, from the Committee on the Judiciary, an amendment as a substitute for several proposed on the subject of polygamy.

None of the amendments got further than to be reported from a committee.

Summary.—There were introduced into the Senate during the session 2,891 bills and 83 joint resolutions, and into the House of Representatives 10,017 bills and 216 joint resolutions. Congress passed 1,095 bills, of which the President approved 814 and 157 became laws without signature, while 115 were vetoed and 9 failed for want of action at the close of the session. One bill was passed over the President's veto.

The session closed Aug. 5, 1886.

CONNECTICUT. State Government.—The following were the State officers during the year: Governor, Henry B. Harrison, Republican; Lieutenant-Governor, Lorin A. Cooke; Secretary of State, Charles A. Russell; Treasurer, Valentine B. Chamberlain; Comptroller, Luzzerne J. Munson. Supreme Court: Chief Justice, John D. Park; Associate Justices, Elisha Carpenter, Dwight W. Pardee, Dwight Loomis, and Miles T. Granger.

Legislative Session.—The Legislature met on Jan. 6 and adjourned on April 14. The following are among the acts of the session:

That probate courts shall have power to appoint conservators for inebriates and dipsomaniacs.

That minors under sixteen shall be excluded from pool and billiard rooms.

That no attorney shall give bonds in any criminal action in which he is interested as attorney.

That town clerks shall be registrars of births, mar-

riages, and deaths in their towns, unless otherwise specially provided by law.

That towns may vote to furnish school-books to children free of charge.

Increasing the penalties for burglary, especially if the burglar has weapons in his possession.

That the Board of Pardons shall have the powers of a Superior Court to compel the attendance of witnesses.

That no person shall be taken out of the State on a requisition until after he is informed of the crime charged, and has opportunity to apply for a writ of *habeas corpus*.

That persons arrested for offenses on cars or steamers may be prosecuted in the town where the arrest is made.

Punishing trustees of public institutions for receiving bribes or commissions on contracts for supplies.

That each savings-bank shall annually report to the Comptroller a list of unclaimed deposits of twenty years' standing, with the name, amount, and last-known address of each depositor.

That "druggists' licenses," issued to druggists, shall contain this clause: "This license does not authorize the sale of spirituous and intoxicating liquors to be drunk on the premises."

That nominations of Common Pleas and District Court judges shall be referred to the Judiciary Committee of the Legislature before the nominations are voted upon.

Authorizing the State Board of Health to investigate the pollution of streams.

That no person shall be disqualified as a witness because of his disbelief in the existence of a Supreme Being.

Restoring the old system of selecting jurors.

That towns may establish Kindergarten-schools for children between three and seven years of age.

Legalizing barbed-wire fences and fixing their height, etc.

That corporations may vote to share their profits with their employees.

To punish fraud in the sale of oleomargarine.

That police officers may make searches and seizures for illegal liquor-selling.

Appropriating \$100,000 for armories in Hartford, Norwalk, and New Britain.

For the protection of trees on highways from being cut or injured by employés of telegraph, telephone, and electric-light companies.

For the study in the public schools of the effect of alcoholic liquors and tobacco and other narcotics on the human system.

Authorizing the Labor Commissioner to employ special agents at an expense not exceeding \$1,000.

Prohibiting the discounting of wages by employers.

Prohibiting the withholding of wages because of any agreement requiring notice before leaving the employment.

That no marriage license be issued until the registrar or town clerk receives the sworn statement of the person applying for the same.

That the Governor shall annually each spring designate "Arbor-day," to be observed in the schools, and for economic tree-planting.

Imposing a State tax of two mills.

Appointing the Governor, Secretary, Treasurer, and Comptroller a commission to examine ballot-boxes invented to prevent frauds in elections and report to the next General Assembly.

Appropriating \$190,000 for improvements at the State-Prison.

Finances.—The finances of the State are in a highly satisfactory condition. On the 1st day of July the funded debt was \$4,721,200. Of this debt, bonds bearing interest at the rate of 5 per cent., and amounting to \$1,030,000, are due May 1, 1897, but are redeemable at the

pleasure of the State after the 1st of next May. The Governor recommends that these bonds be paid as soon as they become redeemable, and that funds for this purpose be provided by the issue of new bonds bearing interest at the rate of 3 per cent., and payable thirty years from date. The large balance of cash in the treasury at the beginning of the last fiscal year was owing to the then recent sale of new bonds which had been issued for the purpose of paying that portion of the State debt which was then maturing. At the close of the last fiscal year the cash on hand was \$230,442.48, and during that year the ordinary receipts of the treasury exceeded its disbursements for ordinary expenses by more than \$300,000.

For the year ending June 30 there came into the treasury, through the ordinary sources of revenue, the sum of \$1,813,701.78. During the same year there was paid out of the treasury for ordinary expenses (including the interest on the State debt) the sum of \$1,511,697.52.

Military Affairs.—The National Guard is composed of 2,244 officers and men.

The last Legislature authorized the building of new armories at New Britain and Norwalk, and the purchase of the one occupied at Hartford, with the condition that the total expenditure should not exceed the sum of \$100,000. Contracts effecting these objects have been made, and involve a total expenditure of about \$92,000.

Banks.—There are eighty-five savings-banks in the State, an increase of one from last year, and the general condition of these banks is better than it has ever been before. On Oct. 1, the total amount of deposits in all the savings-banks of the State was \$97,424,820.85, an increase during the year of nearly \$5,000,000. At the same date the total number of depositors was 266,888, an increase in the year of 10,791. More than two fifths of the population of the State are depositors in these banks.

Insurance.—Within the past year, the Charter-Oak Life-Insurance Company has been placed in the hands of receivers. In the general condition of the other insurance companies no marked change was shown.

On Jan. 1, 1886, there were in the State ten stock fire-insurance companies, with paid-up capital amounting to nearly \$11,000,000, with gross assets of more than \$25,000, and with a surplus above all liabilities of nearly \$7,000,000. The number of mutual fire-insurance companies was sixteen, with assets of \$1,270,000, and with a surplus above all liabilities of \$974,000. The number of life-insurance companies was nine, with gross assets of more than \$110,000,000, and with liabilities (except capital) of \$98,000,000.

Railroads.—The Commissioners report that there is continued improvement in the general condition of all railroads in the State. The freight and passenger traffic, the gross earnings, and the net earnings have all largely increased. The number of passengers carried

was 19,011,381, and of these only five were fatally injured. The accidents at highway crossings were fewer than usual, and resulted in nine deaths, as compared with fourteen the year before. The number of regular Sunday trains has increased, but the number of Sunday excursions has diminished.

Charitable Institutions.—On June 30 the number of patients in the Connecticut Hospital for the Insane was 1,146, an increase of 127. The number of new patients admitted during the year was 361, and the number of removals by death or discharged was 234. The wing completing the new South Hospital building has been finished at a cost less than the sum appropriated.

The revenue derived from the board of patients is enough for all the ordinary expenses of the hospital.

For the purpose of providing accommodations for 150 more of the sick and indigent soldiers of the late war, the last Legislature appropriated \$15,000 for the enlargement of Fitch's Home at Darien. This enlargement is now completed, and gives room for more than 200 additional inmates.

Reformatory Institutions.—On July 1, the number of boys in the State Reform School was 447, an increase of thirty-four as compared with the previous year. The number of boys received during the year was 238, and the number discharged was 204. The three cottages that have been built accommodate 150 boys, or about one third of the whole number, and the superiority of the system is evident.

The State-Prison directors report that the work for the enlargement and improvement of the prison is going on, and, when it is completed, the State will have substantially a new prison with all the modern improvements, at a cost far less than that of any similar institution in the country. The highest number of convicts confined at any one time during the last year was 310, whereas the new prison will have cells for 450. The ordinary expenses of the prison exceeded its income by \$2,401.32.

Bureau of Labor Statistics.—The law fixing the limit of child-labor at thirteen years is meeting with general approval. Employers, as a rule, favor the law and gladly obey its requirements, but many of the parents, impelled by poverty or motives of gain, are disposed to evade it. The Commissioner recommends the enactment of a statute exempting from attachment the wages of mechanics and laborers. Such a statute would take away that basis of credit which is now furnished by the factorizing laws, would compel the storekeeper to refuse to trust except in cases of undoubted personal character and responsibility, and would tend to bring about weekly payments in factories.

Education.—At the close of the last fiscal year, the principal of the school fund amounted to \$2,022,204.27, a loss from the previous year of \$7,919.47. A part of this loss came from the foreclosure of certain old mortgages,

and the rest was the result of the readjustment of the stock of the City Bank of Hartford. The total amount of money raised in the State during the last year for the support of the common schools was \$1,663,019.17. Of this sum about \$759,000 came from town taxation; about \$448,000 from district taxation; about 114,000 from the earnings of the school fund; nearly \$48,000 from the town deposit fund and local funds; about \$228,000 were appropriated by the State; and the balance, of about \$66,000, came from voluntary contributions and other sources.

The number of children between the ages of four and sixteen was 152,166. The number registered in the schools was 125,539, but of these many attended school only a few days, and many more only the sixty days required by the law. The number of children that did not attend school at all was 20,388.

Rhode Island Boundary.—The commissioners appointed to settle the boundary question between Connecticut and Rhode Island, report that their work has been completed, and that the boundary-line, as agreed upon, is satisfactory to all, and makes a just and impartial division of waters that have hitherto been undivided.

Political.—The Democratic State Convention met in New Haven on September 28, and nominated the following ticket: For Governor, Edward S. Cleveland; Lieutenant-Governor, Edward E. Bradley; Secretary of State, Bryan F. Mahan; State Treasurer, William W. Skiddie; Comptroller, Malcolm R. Griswold. The platform contains the following:

In legislative enactments the Democratic party pays due regard to the fullest liberty of the individual consistent with law and order. We recognize the fact that no law to prevent the abuse in the use of alcoholic liquors can be enforced against public sentiment; and we adhere to the views heretofore expressed by the Democratic party that a well-regulated license law, thoroughly executed, will best promote the cause of temperance and good order in society. But a license law, under the control of an exclusively partisan board of county commissioners, who act for their party rather than the welfare of society, will fail of its primary object.

A decrease, in the past four years, of nearly \$600,-000 of the surplus in the State treasury, as shown by the Treasurer's official reports, and an increase of 60 per cent. in the State tax the present year, placing additional taxes upon the people to the amount of \$260,000, call for a return to the Democratic economy of 1873, when, under Governor Ingersoll and a Democratic Legislature, precisely one half of the amount of the present tax was laid. And that low tax was continued, under Democratic rule, for four years, notwithstanding extraordinary expenses were required for building the State Capitol. We demand that the principles of economy, essential at all times, shall be strictly adhered to while the State is in debt over \$4,000,000.

We believe in the largest political liberty, compatible with good order, and approve of laws that shall absolutely protect voters from intimidation and corruption by the privilege of a secret ballot.

We believe that the prosperity of the country depends upon the unity and harmony of the business and industrial interests with the wage-workers, and to this end the Democratic party denounces all that tends to degrade the laborer. It is pledged to all

measures that are calculated to elevate, educate, and improve his condition, and we hereby indorse the position taken by its representatives in the last Legislature, who upheld the ten-hour law, weekly payments, the restriction of child-labor, and an absolutely secret ballot. To the passage of these measures the Democratic party stands committed. And we believe in giving to the true friends of labor the enforcement of all measures designed to benefit the wage-earners.

The Republican State Convention met in Hartford three weeks previously, and made the following nominations: For Governor, Phineas C. Lounsbury; Lieutenant-Governor, James L. Howard; Secretary of State, L. M. Hubbard; Treasurer, Alexander Warner; Comptroller, Thomas Clark. The platform favors a protective tariff, protests against the removal from office of worthy and disabled Union soldiers to make places for partisan civilians and ex-Confederates, and demands that the surplus in the Treasury be steadily applied to the reduction of the national debt. The following are among the other planks:

The Republican party has always been the firm friend of labor against all who would oppress or enslave it, and every measure in State or nation which will tend to protect the workingman from dangerous foreign competition or from home degradation, or improve or dignify his condition, will meet with our unqualified approval. It declares its hostility to the importation of the cheap labor of foreign countries, under contract; to the employment of convict-labor in such manner as to come into injurious competition with free labor; to the granting of any more land to railroad or other corporations, and to the selling of the Government lands to land syndicates or to aliens. We favor the incorporation of organizations of workingmen for the improvement of their members and the protection of their interests, and we pledge ourselves to such legislation as will tend to restore that harmony which should always exist between the employer and the employed. In furtherance of these declarations, and in order that they may be carried into execution (on a proper basis), we believe that the fullest intelligence is requisite for the preservation of a just equilibrium between the great industries of the country. To this end we favor the establishment of a national department of industries and labor, to gather such necessary information as will give a correct starting-point for future legislation. We denounce the attempt of the Democratic party at the last session of Congress to change the tariff laws, as an attack upon American labor, and calculated to reduce the wages of the laboring-man and degrade his condition.

The traffic in intoxicating liquors is justly chargeable with being a great cause of poverty, ignorance, and crime. Our existing local-option laws are in accord with the State's ancient theories of local government, and the Republican party is ready, as it always has been, for the enactment of such laws, tending to eradicate the evils of intemperance, as may be demanded by public sentiment.

We demand an honest and thorough enforcement of the civil-service law, and, as far as practicable, we favor the extension of its principles to municipal and State administrations.

The sacredness of the ballot is the safeguard of the republic, and we renew our declarations against fraud, violence, and intimidation wherever and however practiced, whereby the right of any citizen, white or black, in any part of this country, to cast one ballot and have that ballot fairly counted and returned, is denied, abridged, or imperiled.

We believe the Territory of Dakota, by past precedents and by the letter and spirit of the Constitu-

tion, is manifestly entitled to a place among the sisterhood of States, and we condemn the Democracy in Congress for refusing its admission to the Union.

S. B. Forbes was the Prohibition candidate and H. C. Baker the Labor candidate for Governor. The following was the result of the vote for Governor on the 2d of November: Democratic, 58,818; Republican, 56,920; Prohibition, 4,699; Labor, 2,792; scattering, 15; total, 123,244. As a majority is necessary to elect, there was no choice of State officers by the people, and the Republican candidates were elected in 1887 by the Legislature, which is Republican, having 14 Republicans and 10 Democrats in the Senate, and in the House 138 Republicans, 109 Democrats, and 2 Labor men. Democrats were elected to Congress from the first, second, and fourth districts, and a Republican from the third district.

COREA, a kingdom of Eastern Asia, called by the natives Chō-sen ("Morning Calm"), bounded by the possessions of China and Russia and by the Sea of Japan.

Political Divisions.—Corea is divided into eight *dō* or provinces (see map in "Annual Cyclopædia" for 1885), which, in the main, have natural boundaries of mountain or river, and are the basins of the streams that drain them. They are subdivided into three hundred and sixty prefectures, which include the vast number of outlying islands but not the thirty districts, relics of mediæval feudalism, which are independent of the provincial jurisdictions within which they lie. The natives of Ham-kiung province are the best people of the peninsula morally, intellectually, and physically; those of Kiung-sang, standing next, have dark skins and luxuriant beards, "resembling," as a native says, "the Arabians," who once traded with them. The people of Ping-an rank third. Those of Whang-hai most nearly resemble the Chinese, and are ranked, in the view of most Coreans, the poorest and lowest of all. The Kang-wen people, slight in physique, are strong mentally. In the home province, or Kiung-kai, there is an unusual proportion of the official class, as well as of traders and adventurers.

Government.—The King, Ni-Hiong, is thirty-five years old, and has two sons. The Ni dynasty was founded in 1392. The Queen is of the Ming family, and a woman of great ability. Below the King, with the triple premiership and Royal Council, rank the governors of the provinces. The senior premier nominates to the sovereign three men for each *dō* or circuit. From these the King chooses one. The governor holds office for thirty months, but may be renominated. He has the power of life and death, and freely uses it. His retinue consists of 1,000 persons, that of the King being 3,000. Over each prefecture is a magistrate nominated by one of the royal ministers.

Cities and Ports.—Séoul (capital), or Han-yang (the royal residence on the Han river), is a city situated about twenty miles from the mouth of the Han or chief river of the peninsula (lati-

tude $37^{\circ} 32'$, longitude $124^{\circ} 30'$). The nearest gateway in the city wall is about two miles from the river-bank, the suburbs being densely populated. Politically, Séoul is independent of the governor of Kiung-kai. The climate is good, equable and dry in winter, the thermometer being near zero for two months or more. There is plenty of ice, but little snow. May and June are the hottest months, with the rainy season just before July. The streets, as laid out by the founder of the present dynasty in 1392, were from twenty to two hundred feet wide, with well-built drains of masonry at the sides. The walls, not now including the entire city, go over mountains and valleys, making a circumvallation of ten miles. The wide spaces of the thoroughfares have been greatly encroached upon for building and trade, and the drains so neglected as to be choked, except during the flushing of the rainy season. The population of Séoul is estimated at 200,000, and including the suburbs at 400,000. There are six cities officially computed to contain 20,000 houses each, the reckoning of six persons to a house giving a population of 120,000. Ten cities have each 10,000 houses. Three ports—In-chiun (Chimulpo), near Séoul, Pu-san, in Kiung-san, and Wen-san, in Ham-kiung—are now open to foreign trade. Chimulpo is on a small promontory on the left bank of the Han river, near its entrance into the sea, six miles from In-chiun, the prefectoral town. Opened in 1883, it had in June, 1886, a foreign population of 800 persons. Of these 24 were Europeans, 130 Chinese, and the rest Japanese. Of the 150 houses there were 3 consulates, 3 hotels, 2 banks (Japanese), and a telegraph station. A broad, or sea-front street, and jetty have been constructed.

Foreign Policy.—Corea has treaty relations with most of the European countries, but foreign trade is yet in its infancy. Situated between two powerful and rival nations—China and Japan—her foreign policy consists of measures calculated to please both these nations. The real cause of its intrigues, banishments, and recall of prominent men, and even the riots and assassinations which have marked the national history since King Hiong ascended the throne in 1864, has been the struggle of the pro-Chinese or the pro-Japanese politicians to hold the reins of power and to mold the national policy. After varying fortunes, the party favoring Chinese methods and ideas has since 1884 held power, though a group of moderate Liberals, had previously possession of the royal influence long enough to make the first treaty with a Western nation, the United States. Owing to the British occupation of Port Hamilton, Russia menaces the occupation of Port Lazareff, near Wen-san. A telegraph from Séoul to New-chwang, and thence to Pekin, has been constructed under Chinese auspices.

Coreans in the United States.—No Coreans were known to travel outside of Japan and China until the dispatch of the royal embassy in 1883

to the United States. The refugee Liberals, after the failure of their *coup d'état* in 1884, fled to Japan, as the Government of Tokio looked with disfavor upon the literary and political activity of Kim-Ok-Kiun, the ex-premier, and banished him in July, 1886, to the Bonin islands. There are now in the United States nine Coreans, refugees or students, under Government patronage. All are preparing for college, four for the Christian ministry.

Americans in Corea.—In Séoul, the *chargé d'affaires* of the American legation is William W. Rockhill, with Song Ik Yung as interpreter. In the employ of the royal Government are H. N. Allen, M.D., director of the Royal Hospital and Medical School, with J. W. Heron, M. D., and Rev. H. T. Underwood as assistants; Mr. Merrill is in charge of the customs service, and Mr. H. N. Denny is adviser to the State Foreign Office. The first passport ever granted to a foreigner to travel through the country was issued in November, 1883, to Mr. Pierre L. Jouey, *attaché* of the Smithsonian Institution, who, in fifteen days, traversed the peninsula from Séoul to Pu-san. Dr. Allen and Mr. Merrill made the land-journey in the autumn of 1886 from Séoul to Wen-san. The number of Americans—missionaries, merchants, and travelers—in Corea in 1886 was about fifty. At Pu-san there are 2,000 Japanese, and in all the ports about 2,800, who have banks, newspapers, mail and telegraph facilities, and steamers.

Medical Science.—In the first annual report of the Government Hospital, which was established on the suggestion of the secretary of the American legation, Lieut. Foulk, and opened April 10, 1885, Dr. Allen describes the diseases most common, which are malaria, four-day ague, syphilis, dyspepsia, skin-disorders, dropsy, scrofula, leprosy; with beri-beri, melanosis, distoma, and filaria, which are less frequent. The natives do not rally as well after surgical operations as do the Chinese, owing to their stronger drinks and use of meat. Acupuncture, cautery, and the use of the Chinese system of medicine, in which innumerable drugs and compounds in enormous draughts are depended on by the natives. Baths are not popular. Food is highly seasoned with pepper. Among the 10,460 cases and 394 dispensary operations, there were of fevers, 1,147; disorders of digestion, 2,032; circulation, 114; respiration, 476; nervous, 833; lymphatic, 214; genito-urinary and syphilis, 1,902; eye, 629; ear, 318; tumors, 145; bones, joints, and tendons, 105; wounds and injuries, 140; skin-diseases, 845; diseases of women, 845. Dr. Allen has also treated the King; and Miss Annie Ellers, an American lady, the Queen. Native physicians and a corps of sixteen picked students are being trained in Western medical science. The Medical School was opened March 19, 1886.

Cholera.—Early in the summer of 1886, cholera, introduced from Japan, became epidemic

in Séoul, and, during the summer, carried off 1,000 persons a day. The filthy water in the choked drains, the uncleanly habits of the people, their excess in eating food and in passions, and their habitual use of green food, provided the congenial soil for a pestilence that ceased not until the advent of frost. This visitation of cholera is but a repetition of the scourge introduced from Japan.

Education.—Hitherto only a knowledge of the Chinese classics, and the ability to read, write, and reckon on the abacus, constituted the education of a Corean gentleman. The chief spur to knowledge was the hope of government employ, appointment to office being made by competitive examination. The badge of a graduate or scholar was a certain peculiarity in the dress of the head and body. Schools were private, or under temple patronage. Acting upon a proposition emanating from the American legation, the Foreign Office made application to the State Department in Washington for three teachers to establish a school on Western principles in Séoul. Three young men, D. A. Bunker, G. W. Gilmore, and H. B. Hulbert, graduates respectively of Oberlin, Princeton, and Dartmouth Colleges, were selected by the Commissioner of Education. Arriving in Séoul July 5, they were given charge of thirty-five picked young men of noble family, and on the 16th of September, 1886, the nucleus of the Royal College of Corea, and of a national system of education was begun. The students are supported by the Government, and live in barracks adjoining the school, which is modeled on the American plan. Other foreigners, mostly missionaries, have also opened schools, in which foreign languages are taught. The course of study in the Royal College embraces six years. The probability of high rank and office is a stimulus of great power to those matriculated. In October a union Christian church was organized for foreigners resident in Séoul.

Finances.—The unfortunate political situation of Corea between two great rival nations and her frequent wars with either country, have frequently placed her in a position of financial embarrassment. Her long seclusion and her political system have tended to decentralization and weakness. Both income and expenditure are fixed within narrow limits. After seasons of calamity five methods of obtaining funds have been in vogue: (1) Reduction of the army; (2) reduction of salaries of officers; (3) the utilization of the reserve funds, consisting of 3,050,000 bushels of rice and 100,000 pounds troy of silver; (4) the coinage of copper tokens; (5) the sale of official rank. After the great Japanese invasion of 1592-'99, the official salaries were reduced 66 per cent., and the reserve fund was exhausted, so that the other active means for replenishing the treasury had to be put into effect. The French and American hostilities in 1866 and 1871, and the disturbances consequent upon foreign inter-

course, have, during the present King's reign, almost reduced the treasury to emptiness. The sale of official positions and new levies of taxes have failed to bring relief, and a reform in administration is imperative. A national debt has been created, and \$1,000,000 is now owing to Japanese, Chinese, and German bankers. At present the customs service is one of heavy expense; the profits, when in hand, are, by treaty made with the Japanese, to be devoted to the erection of lighthouses at important points.

Gold-Mining.—Gold in quartz is found in many places, but in Ham-kiung it is alluvial. In the former case the rock is crushed with hammers, and the dust washed. In the placers, a shallow wooden bowl holding two shovelfuls of earth is set under a running stream, and kept in agitation, only the coarser gold being saved. Native methods are exceedingly wasteful, no machinery being used; 25,000 men were engaged in the washings during 1886. The number of permits issued by the Government varies according to the harvests. When crops are good, the number is curtailed. The bullion and dust are exported to Séoul, China, Siberia, and Japan. Nine tenths of the gold coins struck at the Osaka mint are of Corean metal. In 1883 the export of gold from Wen-san, noted at the custom-house (reckoned at \$20 per fael or 14 ounce) was \$28,920; in 1884, \$110,265; in 1885, \$375,148; in 1886, to June, \$155,110; and, in July, one Japanese steamer took away \$42,000. Mr. George C. Foulk, in his report to the State Department, dated March 20, 1886, that the miners pay as royalty to the Government and magistrates 50,400 pounds of gold annually; that from 1881 to 1884, 6,540 pounds of gold, valued at \$1,885,033, and 18,680 pounds of silver, worth \$387,780, were exported by sea; that 82 mines of gold, 4 of silver, 17 of copper, 40 of iron, 9 of coal, 7 of lead, and 13 of precious stones, are known and worked. Mr. Ito states that the exports of crude gold, from 1881 to 1884, amounted to \$3,785,033,191, and of silver \$387,769,444, an average of about \$1,200,000 of metal per annum. In the overland trade with Russia and China gold is exported, and a heavy outlay of silver—1,000 pounds for each ambassador—is required for the embassy sent to Pekin annually.

Trade.—At Chimalpo, in 1885, trade aggregated \$1,159,322, an increase of 98 per cent. over the \$585,960 of 1884. Of exports, the staple is hide and of imports cotton, the total figures of export for 1884 being \$60,951, and for 1885, \$132,583, and of imports \$546,258 and \$180,442. At Gensan, the trade in 1885 was \$564,052, as against \$306,132 in 1884. Of the \$53,835 worth of exports, cow-hides figure at \$50,000. The difficulty of transport (\$3.50 on a ton of goods from Séoul to Chimalpo, a distance of twenty-five miles), the lack of good roads, the meanness of the small copper currency, and the general apathy of the people, make the development of trade, while hopeful, slow and uncertain.

COSTA RICA, one of the five Central American republics. The area is estimated at 19,980 square miles; and on Dec. 31, 1885, the population was 193,144. The frontier disputes between Costa Rica and Colombia on the one hand, and between the former and Nicaragua on the other, are to be settled by international arbitration.

Government.—The President of the Republic is Don Bernardo Soto, whose Cabinet was formed of the following ministers: Foreign Affairs, Don Ascension Esquivel; Interior and Public Works, Don Leon Fernández; Finance, Don Mauro Fernández; War, Don Santiago de la Guardia. The United States Minister to the five Central American republics, resident at Guatemala, is Hon. H. C. Hall. The American Consul at San José is J. Schroeder. The Minister Resident of Costa Rica in the United States is Señor M. M. Peralta, and the Costa Rican Consul-General at New York is Señor José María Muñoz. On May 5 the Costa Rican Congress appointed Don Apolinario de Jesús Soto, Don Ascension Esquivel, and Don Carlos Duran, Designados or Vice-Presidents.

Finance.—The report of the Minister of Finance of Feb. 11, 1886, shows that on that date the national indebtedness stood as follows: Consolidated foreign debt, £2,000,000; home debt, \$873,826. During the fiscal year ended March 3, 1886, the income was \$3,200,065, being \$263,308 greater than it had been estimated in the budget. The chief sources of income were: Puntarenas custom-house, \$381,484; Limon custom-house, \$535,780; liquor monopoly, \$747,961; tobacco monopoly, \$466,974; railroad, \$112,760; post-office, \$15,918; telegraph, \$14,220. The outlay was \$2,088,944, being \$114,963 greater than had been estimated. The budget estimate for 1886-'87 is \$2,707,614 income, and outlays to an equal amount. The conversion of £4,810,812 debt of Costa Rica was negotiated by the agent of the Government in June, 1885, ratified by the Costa Rican Executive on Oct. 16, 1885, and accepted by the council of foreign bondholders in December of the same year. The arrangement arrived at was this: In return for £100 of the 6 per cent. loan of 1871 the republic issued in bonds £50 at 5 per cent. interest, series A, the first coupon payable July 1, 1886, and added thereto £22,101 in shares of the Costa Rica Railway Company. For every £100 of the 7 per cent. loan of 1872 there were returned £50 new bonds at 4 per cent., series B, the first coupon payable July 1, 1886, and there were added £22,101 in shares of the Costa Rica Railway Company. Series A bears 5 per cent. from the time of issue; series B, 4 per cent. during the first two years, and thenceforward also 5 per cent. The conversion was conditional, the Government binding itself to make arrangements for the carrying out of the concessions of April 21, 1884, relating to the railroad and its equipments, within three years. The Union Bank

of Costa Rica is to collect till the year 1888 the customs revenue pledged as security for the new bonds; all money to be paid to Messrs. C de Murrieta & Co., London, to be distributed by the River Plate Trust, Loan, and Agency Company.

Army.—The actual strength of the army in 1886, including officers of all ranks, was 1,000, with a militia reserve of 27,000.

Post-Office.—In 1885 there passed through the post-offices of the republic 1,828,392 items of mail matter, as follows: 408,466 letters; 136,360 Government dispatches; 9,072 postal-cards; 1,172,664 newspapers; 488 sample packages; 1,202 business notifications; 2,947 certificates; 653 requests of notices; 140 reports; 5,815 registered letters; and 191 postal orders to the amount of \$14,972; together, 1,737,998 items.

Telegraphs.—There were in operation in 1886 three sections of telegraph: one, 135 miles in length, connecting El Puriscal, Santo Domingo, San Ramon, Grecia, and El Navanjo; another, 101 miles, connecting Esparta with Liberia; and a third, 48 miles, connecting Liberia with the frontier of Nicaragua. There were twenty-two offices, and they forwarded, between March 1, 1885, and Feb. 28, 1886, 22,607 Government messages into the interior, and 38,039 private messages. There were also 2,480 private messages sent to Nicaragua. There were received, during the same twelvemonth, 2,500 telegrams from Central America, and 359 from abroad.

In January, 1886, twelve telephone-offices were opened at the capital, and the system was being rapidly extended.

Railroads.—At the close of 1885 there were in operation the following lines: Alajuela to San José, 22 kilometres; Puntarenas to Esparta, 22; San José to Cartago, 22; and Limon to Rio Sucio, 113, together, 179 miles. The rolling stock consists of 6 locomotives and 37 cars. The number of passengers conveyed was 158,338, and the freight carried to 7,072 tons. The gross earnings were \$23,045, and the expenses \$25,273, resulting in a loss for the year of \$2,228. On Aug. 20 work was begun on the Reventazon or Atlantic Railroad. In June a company was formed in London for the purpose of buying the Costa Rica Railroad between the port of Limon and the village of Carrillo, and between Cartago and Alajuela, together with the wharf at Limon. The company furthermore intends building a branch line from some point on the Limon-Carrillo line near the river Reventazon, to connect with the Cartago-Alajuela Railway.

Early in 1886 the contract made between the city authorities of the capital and Silas Wright Hastings, for the construction of one or more tramways, received the Government's approval.

Steamship Line.—In August the Government contracted with Charles F. Irigoyen and Joseph F. March for the establishment of a line of

steamers between San Francisco and Panama, to touch at intermediate ports. The line will be known as the "Hispano-Centro-Americana," and its steamers will carry the Spanish flag. The vessels are to touch at Puntarenas and whatever other ports may be opened on the Pacific side of Costa Rica, at least once a week, and carry all mail-matter.

The Costa Rican Government requires that the steamship company shall care for and instruct eight young men of that country on each of its seven steamers, who shall be appointed by a commission after competitive examination. These will be placed on board the steamers as apprentices, and, after a certain number of years' service and competitive examination, will be given diplomas as sea-captains and engineers. The Government agrees to grant a rebate of 5 per cent. on the duties of merchandise shipped on board the vessels of the company, to give the company eighteen acres of land for the construction of warehouses, and a subsidy of \$10,000 per annum for the first five years of the contract and \$8,000 per annum for the remaining five years. The operation of the line was to begin not later than Oct. 15, 1886.

Textile Industry.—The Government furthermore conceded to Messrs. P. W. and E. G. Chamberlain the privilege for two years of introducing into the country duty free, machinery and accessories necessary for the preparation of textile fiber grown in the republic; and for a term of fifteen years, free of duty and wharfage, of the chemical substances and coal they may need for the purpose.

The Government granted, early in January, to Federico Velarde, the privilege of importing, duty free, woolen yarns, twist, and thrown silk, for the manufacture of fabrics, whether those yarns be bleached or dyed.

Minerals.—Rock-crystal and placer-gold are found in the Cuesta Blanca, on the Pacaca road; onyx in Pacaca; amethysts in the Colorado salines and the Barbulad mountain, where handsome jasper is also met with. Opals are found in Candelaria; labradorite in the mountains north of Raiceiro; kaolin abounds in San Ramon; lime for cement in Candelaria; phosphate of lime in San Antonio; and valuable iron-ore on the coast at Sardinal.

Commerce.—The following is a tabular statement of the foreign trade in 1885:

IMPORTATION.

COUNTRIES.	Value.
From England.....	\$1,657,940
From France.....	443,302
From Germany.....	605,016
From the United States.....	856,645
From other countries.....	68,028
Total.....	\$3,660,931

EXPORTATION.

To England	\$1,362,190
To France.....	225,212
To Germany.....	375,192
To the United States.....	1,058,519
To other countries.....	175,395
Total.....	\$3,296,508

CRAB-FARMING.

The export of coffee from Costa Rica in 1885 was:

COUNTRIES.	Quintals.	Value.
To England.....	103,722	\$1,296,588
To Germany.....	27,664	345,804
To France.....	25,153	314,488
To Spain.....	25	317
To Belgium.....	139	1,741
To New York.....	17,036	212,962
To New Orleans.....	6,296	78,628
To San Francisco.....	17,604	220,050
To Colombia.....	1,288	16,112
Total.....	198,932	\$2,486,648

The American trade for the fiscal year, 1886, was as follows:

Import from Costa Rica into the United States.....	\$898,045
Domestic export from the United States to Costa Rica.....	548,215

Education.—There were in Costa Rica on Jan. 1, 1886, 115 primary public schools for boys, and 101 for girls; together, 215 schools. The number of children of school age was 32,306, of whom 17,026 were boys and 15,280 girls. Assuming the population then to have been 193,144, the proportion was one school child to six inhabitants. The number of children attending school was 13,413, of whom 7,355 were boys and 6,058 girls. Of private primary schools there were 86, attended by 1,042 male pupils and 819 female pupils; together, 1,861 scholars. The school-tax produced, in the seven provinces together, \$24,489.

CRAB-FARMING.—The increasing demand for edible crabs in the great seaboard markets has led the fishermen of the neighboring coasts, especially that of New Jersey, to adopt a system of crab-culture, or rather of crab-preservation, which renders it possible to market the catch in far better condition than formerly. This is known as "crab-farming," but it hardly merits the name, as it has not yet advanced beyond the protection of the crabs from their natural enemies. Those that are engaged in the business pay little attention to breeding. They know that during September the season properly ends, because the female crab carries about with her a spongy substance, consisting of thousands of small eggs. These are hatched in due time, and, except after very severe winters, the supply of young crabs is abundant, but they are not large enough for market before the second year.

In May the mature crabs emerge from their winter-quarters in the deep mud, and appear in shallow water, where they are netted in large numbers and sorted out, according to condition, into circular stockades or pens made of stakes driven close together in the shallows. Crabs are in their best edible condition when they outgrow and shed their hard shells and emerge very fat, and with shells so thin that they are properly called "soft-shelled crabs," though they are not, as is supposed by many, a distinct species. When captured in this state the crab is sent to market at once, as his shell hardens in a few hours if suffered to remain in

the water. A majority of the catch is certain to be in an unmarketable state. They are either hard or semi-hard shelled, and in either case are placed in the stockade. In local phrase, a crab that shows signs of shedding his shell within a few days is called a "comer." When the time of change is obviously close at hand, he is a "buster," and after the old shell has been cast off he is a "shedder," and the sooner he is sent to market the better price will he command. If he is overlooked for a day he becomes a "buckler"—that is, his shell has hardened so that a slight pressure upon it causes it to bend or "buckle," like the bottom of a tin pan. If he reaches this stage he must needs be kept until again ready to become a "shedder," usually two or three weeks. During their period of confinement in the stockade the crabs must be judiciously tended. If they are fed too liberally, they fatten prematurely and die. If they are not fed enough, they eat one another, especially if one of their number chances to become a "shedder" while the watchman is away. Crabs thrive upon almost any kind of waste food. When free, they are general scavengers, and are not fastidious when confined. Stockades are of various sizes, according to the resources of the owners. One man can supply and watch a pen a dozen or fifteen feet in diameter, but larger dealers employ several men and boats, and keep several twenty-foot stockades in active operation.

No successful attempt has as yet been made to breed crabs for market, and, notwithstanding the enormous consumption, the supply keeps well up with the demand. During the season the price per dozen in the New York market ranges from a few cents to two dollars—seventy-five cents being a fair average for the whole season. Of late years, when the market is overstocked, the crabs are frozen by artificial means, and sent to the large inland cities of the South and West. Fair Haven, on Shrewsbury river, is the headquarters of the New Jersey crabbers, and 250 dozen crabs is an average daily shipment from this port alone. The crabs are packed in shallow boxes on beds of fresh sea-weed, and are thus kept alive and in good condition for twenty-four to forty-eight hours.

CUBA, an island in the West Indies, belonging to Spain. (For statistics of area, population, etc., see "Annual Cyclopaedia" for 1883.)

Army.—The Commander-in-Chief and Captain-General of the island is Don Emilio Calleja & Isasi. The strength of the Spanish forces in Cuba, in 1886, was 19,858.

Finance.—Cuba's indebtedness in May, 1886, was, as shown in the following table:

Paper money in circulation issued during the insurrection	\$26,788,506
Hypothesis of 1880	62,250,000
Custom-house bonds of 1878	5,537,500
Three-per cent. bonds with one-per-cent. sinking-fund	20,215,278
Annuities	11,750,468
Total	\$136,341,752

The floating debt was \$30,860,000, making a total of \$167,201,752.

In May there was placed on the European market a 6-per-cent. Cuban loan to the amount of 170,000,000 pesetas or francs, at 87, less 3-per-cent. commission, the Spanish treasury guaranteeing them the bonds, of which there are 340,000 of 500 pesetas each to run eighty-five years. There were subscriptions to the amount of 617,108 bonds. In other words, for every 100 bonds subscribed for, only 55·05 could be awarded.

Post-Office.—During the fiscal year 1884-'85, the Cuban post-offices received from abroad 562 mails, the letters weighing in the aggregate 7,478,187 grammes, and the newspapers 10,027,846. It forwarded abroad 714 mails, with the respective weight of letters and newspapers of 7,465,750 and 19,176,400 grammes.

Railroads.—The Bay of Havana Railway earned in 1885, £53,117 net, of which £36,526 was paid to first-mortgage bondholders in the shape of interest, and set aside toward the sinking-fund the net earnings showing an excess over those of 1884 of 11½ per cent. The line is in good condition and prosperous, in consequence of the large sugar-crops. The company made a new 7-per-cent. loan in April, 1886, to the amount of £345,000, payable, in 1917, at 98.

The Western Railroad of Cuba, which traverses the famous Vuelta Abajo tobacco-region, was expected to be in operation all the way to Pinar del Rio toward the close of 1886.

Farming Interests.—Early in 1886 there were in operation in Cuba 1,200 sugar-plantations, 5,000 tobacco-plantations, 160 coffee-plantations, 25 cocoa-plantations, 5,000 stock-farms, 17,000 truck and other farms, and 95,000 stores and industrial establishments.

Sugar-Crops.—The Cuban sugar-crop that came to market in 1886 amounted to 750,000 tons, and, judging from the appearance of the canes in the autumn of 1886, it was hoped that, in 1887, 1,100,000 tons additional would be produced.

Mining.—In 1885 there were in existence in the island the following mines:

Concessions.	MINERAL.	Area in hectares.
91	Iron-ore.....	5,350
41	Copper.....	427
5	Gold.....	84
3	Manganese.....	122
2	Quicksilver.....	24
15	Asphaltum.....	891
3	Petroleum.....	465
2	Naphtha	140

Of these concessions the following were in productive operation: One asphaltum in the Havana district, which produced 1,799 tons, employing 10 workmen; three asphaltum in the Pinar del Rio district, producing 1,250 tons, employing 22 workmen and two four-horse-power engines; two asphaltum in the Matanzas district, producing 300 tons, employing 12 men; one petroleum well in the Matanzas district, producing 283 hectolitres

with 6 men and one four-horse-power engine; one naphtha well in the Santa Clara district, producing 34 hectolitres; three ironore beds in Santiago de Cuba, producing 23,877 tons, employing 270 hands and engines of eighty-six horse-power; three copper-mines in Santa Clara and Santiago de Cuba, yielding 67 tons of cement copper and employing 27 hands. The import of mining machinery and supplies, which as such are free of import duty, amounted in value to \$170,639. The largest amount of machinery imported was by the Juragua Iron Company, for its new mines and railroad near Santiago. The stockholders of this company are the Bethlehem Iron Company, the Pennsylvania Steel Company, and the Cambria Iron Company. The iron-ores average about as follow: Metallic iron, 66 per cent.; sulphur, 0·07 per cent.; phosphorus, 0·041 per cent.; silica, 2·03 per cent. The highest phosphorus determinations only show 0·083 per cent. This company has built a railroad 27 kilometres long, entirely of American material. The large iron pier at the terminus of the road is also the result of American enterprise. The ore is transported to Philadelphia, the quantity reaching 15,000 tons a month. The company employed 600 men in 1886.

Bat-Guano.—Large quantities of bat-guano have been discovered on the south coast of the island. This guano is deposited in caves, one of which was estimated to contain from 25,000 to 30,000 tons. The facilities for working these deposits are said to be excellent.

American Enterprise.—The American consul reported to the State Department in August from Havana: "American capitalists are beginning to increase and work up the mahogany and cedar exportation from here. One company in particular tends fair soon to control a most formidable tract of land in the northern part of this province. All our fellow-countrymen laud the manner in which the Spanish Government here facilitates their movements by a readiness to help and aid them in every way. This only holds as regards the executive branch of the Government, and does not refer to the custom-house regulations, which tend in every way to discourage importation."

Emancipation.—The number of slaves declared free, in accordance with the abolition law, between May 5, 1885, and May 7, 1886, was 25,523. The number of slaves who, at the latter date, had obtained their freedom during the six years elapsed since the promulgation of the law, was 120,253. The remaining 25,381 were freed by vote of the Cortes in October, 1886.

Commerce.—According to statistics published by the Minister for the Colonies, the total foreign-trade movement in Cuba during the fiscal year 1884-'85 was \$88,224,263, there having been imported \$31,587,859 and exported \$56,636,404. This movement includes \$5,776,849 imported from Spain, and \$4,704,388 exported to that country, the entire trade

with the mother-country consequently not exceeding \$10,481,237. The American trade with Cuba is shown in the following table:

FISCAL YEAR—	Import from Cuba into the United States.	Domestic export from the United States to Cuba.	Total trade.
1886.....	\$51,110,780	\$10,020,879	\$61,131,659
1885.....	42,306,093	8,719,195	51,025,288
1884.....	57,181,497	10,562,880	67,744,377
1883.....	63,544,584	14,567,918	80,112,452

The Cuban custom-houses collected during the fiscal year 1885-'86 \$14,808,192, an increase of \$1,539,838 compared with the amount of revenue they yielded the previous fiscal year.

There entered Cuban ports during the fiscal year 1885-'86, altogether, 3,189 vessels, against 3,040 the previous fiscal year. The aggregate tonnage of vessels arrived was 2,437,155 in 1885-'86, against 2,315,109 in 1884-'85.

The American Consul-General at Havana is Ramon O. Williams.

Reciprocity Treaty.—The text of the commercial convention between Great Britain and Spain, signed at Madrid on April 26, subsequently ratified by the British Parliament and the Spanish Cortes, and going into operation in August, provides that Spain grants to the United Kingdom and its colonies and foreign possessions the "most-favored-nation" treatment in all that concerns commerce, navigation, and consular rights and privileges in Spain, the Spanish colonies, and foreign possessions, coextensive with that accorded to France and Germany. Article III provides that the convention when approved shall remain in force until the 30th of June, 1892. The right was reserved to Canada to say within one year whether she will accept the treaty or refuse to abide by its provisions. Meantime Spain and her colonies are open to Canada on the same terms as the most favored nations.

Discriminating Duties.—Under date of June 22, the Spanish Minister for the Colonies, Señor Gamazo, upon representations made by Minister Curry, addressed to the Captain-General of Cuba a dispatch in which he stated the American complaint of infringement of the subsisting treaty agreement in the following terms:

The minister plenipotentiary of the United States of America has complained to the Government of his Majesty respecting the manner in which the agreement of Feb. 13, 1884, is enforced in your island, alleging that Article I gives the right to the North American flag to be placed on an equality with the Spanish flag in the ports of said island in respect to the collection of duties of all kinds, and consequently he complains that a differential duty is maintained in your island respecting foreign goods transhipped in American ports, as also that navigation dues continue to be exacted from American vessels different from those fixed for Spanish vessels; and in view of his arguments and of other antecedents which aid in a proper interpretation of said agreement, his Majesty the King, and in his name her Majesty the Queen Regent, with the object of demonstrating the good intentions of Spain toward the United States and the good faith with which it seeks to enforce its treaties, has been pleased to decree, ratifying the royal order of May 7, 1886,

that the American flag in the direct trade with the islands of Cuba and Porto Rico shall be put on a complete equality with the Spanish flag in the transportation of products proceeding from the United States. Respecting navigation dues, although the equal treatment of American with Spanish ships is not provided for in the agreement, adhering to this spirit of deference to the said nation, it is the will of his Majesty that, as soon as it is shown by the representative of the United States in your island that his Government has granted this treatment to Spanish vessels, your customs officers shall apply it to American vessels, in just reciprocity and in conformity with the royal decree of June 4, 1878. By royal order I communicate this to you for your information and its proper observance.

Three months after the foregoing order had been issued it was repudiated by royal decree, the Foreign Office at Madrid ignoring its interpretation as proclaimed. Spain wishes to have the privilege of carrying cargoes from Cuba to the United States, previously not conceded, being subject to 10 per cent. additional duty, to correspond with the 10 per cent. extra duties levied in Cuba on importations under the American flag. The different duties were enumerated under three heads for the Spanish flag, and a fourth for the American or foreign flag, the fourth column being the 10 per cent. extra in the agreement between the two governments. As stipulated, the agreement might apply only to products of the United States, coming from there. Products of the United States have been admitted on the third column; but other merchandise, such as fish or other commodities from the British provinces, has had to pay according to the fourth column, while such importations from New York under the Spanish flag have paid duties under the third column. As for the tonnage dues, steamers arrived in Cuba from Spain were loading sugars for New York, and paying no tonnage dues, while American vessels were paying in Cuba 62½ cents a ton inward and 62½ cents a ton outward.

The President of the United States, in consideration of the lack of reciprocity on the part of Spain, under date of Oct. 13, 1886, issued a proclamation containing the ensuing passages:

And whereas proof is given to me that such complete suppression of the differential flag duty in respect of vessels of the United States and their cargoes entering the ports of Cuba and Porto Rico has not in fact been secured, but that, notwithstanding the said agreement dated at Madrid, February 13, 1884, and in contravention thereof as well as of the provisions of the said section 4228 of the Revised Statutes, higher and discriminating duties continue to be imposed and levied in said ports upon certain produce, manufactures, or merchandise imported into said ports from the United States or from any foreign country in vessels of the United States than is imposed and levied on the like produce, manufactures, or merchandise carried to said ports in Spanish vessels:

Now, therefore, I, GROVER CLEVELAND, President of the United States of America, in execution of the aforesaid section, etc., do hereby revoke the suspension of the discriminating customs imposed and levied in the ports of the United States on the products of and articles proceeding under the Spanish flag from Cuba and Porto Rico, which set forth and contained

in the aforesaid proclamation, dated the 13th day of February, 1884, this revocation of said proclamation to take effect on and after the 25th day of October instant.

Immigration.—A decree of the Minister for the Colonies, appearing in the Madrid official "Gaceta" of December 7, regulated and determined the assistance the Government will give to societies that promote free immigration into Cuba. The Government will pay the passage-money for Spanish immigrants and their families from Spain and the Balearic Isles to Cuba. It will pay the cost of passage of free foreign immigrants from Europe and Africa to Cuba only, and will grant \$40 to each free immigrant from Asia and Oceania. Special favor will be shown by the authorities in Cuba to white immigrants and Spanish-born immigrants from Spain or Spanish-American countries. After one year's residence, white immigrants will enjoy the same privileges as "time-expired" soldiers settling in Cuba.

Coal and Steel Rail Imports.—In 1886 the arrivals of coal in Cuba have been almost entirely on contract, and the prices from \$4.50 to \$6 a ton for American, and from 25 to 29 shillings a ton for English. The latter was rapidly losing favor in the Havana market, being only used where good coal is really necessary. Of the common sorts, the American is cheaper, can be obtained at shorter notice, and the gas-works company claim for it the advantage of containing more gas than the English, good Welsh and Staffordshire being the only British coals that find a ready sale there. Iron rails are mostly imported from Belgium, and machinery from the United States. The importations of Bessemer steel rails have amounted to about 5,000 tons, at prices varying from \$42 to \$27 cost, freight and insurance. The greater part was imported from Belgium, Germany, and France, the English manufacturers not having been represented until the beginning of 1886. About 1,500 tons of light portable rails were also imported from the United States.

The Cigar-Makers' Strike.—In October a cigar-makers' strike assumed gigantic proportions at Havana, throwing 20,000 operatives out of employment. The strike, originating in a demand for increased wages from the makers of Partido tobacco cigars, extended to those working Vuelta Abajo leaf, and to the adjoining cities of Santiago de las Vegas, Bejucal, San Antonio, Guines, and other towns. The factories remained closed until Nov. 18, when the men went to work again on an agreement to form committees to arbitrate their claims. The committee fixed the claims in some factories, but other claims were pressed, which the committee refused to arbitrate, as they had risen since Nov. 18. The matter was held in abeyance, and the men went out again on the 20th. On Nov. 26 they all returned to work again.

CYCLORAMA. This word is derived from the Greek words *κύκλος*, *a circle*, and *θάμα*, *a scene*; its natural English meaning is *a circular scene*. It is of comparatively recent origin, and is found only in the latest editions of dictionaries, although the system of pictorial representation to which it is now applied, including the laws of cycloramic perspective, have been understood for two or three centuries. It is only within a generation that cycloramas have been painted and constructed with a satisfactory degree of mechanical perfection, and only about ten years since the aid of photography and of greatly improved machinery and accessories has produced the wonderfully realistic effects attained in the great paintings of American battle-scenes recently exhibited in the principal cities of the United States. In preparing a painting of this character the ordinary rules of perspective are useless, save in a fragmentary way. The observer, instead of including the entire picture in the natural angle of vision, is surrounded by the painted canvas

was centered on the platform and arranged so that it could sweep the entire horizon, and ten pictures were taken, each including two of the twenty-four range-stakes. In the finished photographs the stakes served to register the series, and when attached in a continuous strip the ten pictures, of course, gave a continuous panorama of the field. Pasting together the ends of this strip, the panorama became a cyclorama, and afforded an accurate guide for enlargement on the grand scale contemplated for the painting. Of course, each separate photograph had its own system of linear perspective, and artistic ingenuity had to reconcile the apparent distortions of the camera—an easy task, since the vanishing-point for any object could be ascertained by projecting the radius of the great circle to the general horizon-line, which is, of course, common to the whole painting.

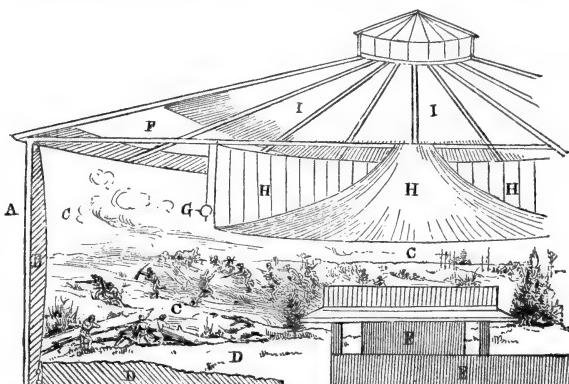

A special building is required for such a work as this. Those that have been built in this country are mostly of corrugated iron, circular in general shape, and large enough to

leave space for passage behind the canvas after it is in place. In the center is a circular platform a little lower than the horizon-line of the painting. This is covered with a canopy, cutting the line of vision just below the top of the painting. The light falls from above this canopy through a sky-light by day, and from a circle of electric lights by night. From this platform the progress of the painting is superintended.

The canvas is fifty feet wide, and when ready for hanging is wound on a large roller arranged so that it can revolve on a vertical axis. A circular tramway is laid on the floor of the building close to the outer wall, and a frame mounted on wheels runs on this,

carrying the canvas-roll. A wooden cornice-frame runs around the entire building at the eaves, and to it the upper edge of the canvas is nailed. The frame is rolled along the circular track as fast as necessary, delivering the canvas as it moves. When the canvas is in position and the ends sewed together, its lower edge is attached to a huge ring made of gas-pipe, corresponding in size with the cornice-frame. The ring and the twenty-five-pound weights hung all round at three-foot intervals are sustained by the canvas, which is thus strained heavily downward, and can yet expand or contract without wrinkling. Instead, however, of forming a perfect cylinder in shape when placed in position and weighted, the canvas bulges inward a foot or more midway between the upper and lower edges, and the horizon-line, apparently the most distant part of the painting, is really nearer to the observer than the sky and the middle distance.

After the painting is finished, and the me-

SECTION OF A CYCLORAMA.

just as he is surrounded by the landscape when out-of doors. This necessitates different points of sight, or vanishing-points as they are technically called. (See article on DRAWING, in Appleton's "American Cyclopædia.") Strictly speaking, these points are infinite in number in a cyclorama, but practically they are reduced to as small a number as is consistent with picturesque representation. This is known as cycloramic perspective. In the great historical painting of the battle of Gettysburg, the artist, Paul Philippoteaux, who has also superintended the execution of most of the other great paintings of this class, personally inspected the battle-field and selected the most available central position from an artistic point of view. Here he erected a scaffolding with a platform at a suitable height, and drew a circle around it about eighty feet in diameter. At intervals of about twenty-four feet stakes were driven in this circle dividing the whole circumference into ten equal parts. A photographic camera

chanical appliances are removed, the foreground is arranged with something of the landscape-gardener's art. Real grass, shrubs, and the like, are disposed around the central platform, and so skillfully blended with the painted middle distance that it is almost impossible with the unaided eye to determine where one ends and the other begins. The atmospheric effect is enhanced by the manner in which visitors are introduced to the cyclorama. The entrance is through a long, narrow, dimly lighted passage-way, ending in a winding stair; and when the visitor emerges upon the central platform, his eye, having adjusted itself to a dim light, is

prepared to accept at more than its true value the brightness of the rotunda. He has, moreover, in a measure lost his sense of orientation on the winding stair, and the artificial prospect is presented with much the same effect as if it were seen from a hill-top under the open sky.

The illustration represents part of a cross-section of a cyclorama. A is the outer wall; B, space between wall and canvas; C C C, canvas; D D, foreground; E E, covered entrance passage-way, winding stair, and spectators' platform; F, sky-light; G, electric lamp; H, canopy; I, roof.

D

DAKOTA. Territorial Government.—The following were the Territorial officers during the year: Governor, Gilbert A. Pierce; Secretary, M. L. McCormack; Treasurer, J. W. Raymond; Auditor, E. W. Caldwell; Attorney-General, George Rice; Superintendent of Public Instruction, A. Sheridan Jones; Railroad Commissioners, William M. Evans, Alexander Griggs, and W. H. McVay; Commissioner of Immigration, Lauren Dunlap. Supreme Court: Chief-Justice, Bartlett Tripp; Associate Justices, C. S. Palmer, W. H. Francis, W. B. McConnell, William E. Church, and L. K. Church.

General Condition.—The Governor, in his report to the Secretary of the Interior, dated Oct. 1, says:

Dakota suffered in common with the rest of the country from business prostration and from the drought, which injured the smaller grains. The drought was not general, but local, some parts of the Territory showing large yields, while in others the failure was almost complete. Indeed, it is not unusual to find farms in the same county showing strikingly dissimilar results, one with its grain a practical failure, the other showing a full average production. I think it safe to say that in wheat and oats the shortage in the crops over last year, will be at least one third; flax, rye, and barley also suffer. The yield of potatoes and other roots will probably be nearly up to the average.

Farmers have given much attention to cattle-raising of late years, and have that product to fall back upon when grain is in loss. This industry has developed very rapidly in all parts of the Territory. In the older counties of South Dakota the farmers have long been accustomed to keeping a limited number of cows and beef-cattle. But it was supposed the large cattle-ranches must be confined to the western part of the Territory, where the abundant grasses and limited snow-fall enabled cattle to graze during the winter months. Late experiments have demonstrated, however, that cattle-raising can be profitably pursued even in the extreme northern part of the Territory, and the result has been the establishment of large cattle-ranches in various sections, while there are few farmers in any part of the Territory who have not herds.

The total of lands taken up for settlement during the year ending June 30, 1886, is estimated by the Commissioner of Immigration at

4,000,000 acres. He estimates the increase of population for the year at 85,000, making the total population of the Territory 500,000. While the Western and Middle States continue to furnish a good majority of the new-comers to Dakota, a larger proportion than usual comes this year from Eastern and New England States and Canada. The foreign immigration other than from Canada for the year has been comparatively small, the Scandinavian countries furnishing the greater number.

Financial.—The bonded debt of the Territory remains the same as a year ago, namely, \$568,200. The assessment of 1886 shows an increase over 1885 of about \$24,000,000, making the total assessment for this year in round numbers \$130,000,000. The tax levied for Territorial purposes has been decreased from year to year, until for 1886 it is but 2 1/4 mills. The total county indebtedness of the Territory, bonded and floating, is a little over \$3,000,000.

Valuation.—The following statement gives the assessment for two years, Emmons and Marshall Counties wanting for 1886:

ITEMS.	1885.	1886.
Total assessment	\$106,007,307 00	\$132,063,905 00
Acres of land.....	16,050,041	17,703,881
Value of same.....	\$56,644,269 00	\$65,511,892 00
Average per acre	\$3 53	\$3 67
Value of town lots.....	\$18,919,327 00	\$21,298,565 00
Property in merchandise	\$4,364,537 00	\$5,982,601 00
Capital in manufactures	\$171,956 00	\$388,644 00
Number of horses	168,847	205,059
Value of same.....	\$7,849,357 00	\$10,615,162 00
Average per head.....	\$46 57	\$51 02
Number mules and asses	15,702	16,738
Value of same.....	\$891,781 00	\$971,517 00
Average per head.....	\$56 47	\$58 40
Number of cattle	397,872	475,842
Value of same.....	\$5,602,882 00	\$7,429,607 00
Average per head.....	\$14 69	\$15 63
Number of sheep	136,961	132,581
Value of same.....	\$156,632 00	\$165,375 00
Average per head.....	\$1 15	\$1 27
Number of swine.....	158,633	173,128
Value of same.....	\$321,073 00	\$387,007 00
Average per head.....	\$2 09	\$2 24
Value of vehicles	\$2,822,739 00	\$2,555,012 00
Moneys and credits	\$2,392,380 00	\$2,707,546 00
Household furniture	\$445,683 00	\$461,808 00
Stocks and shares.....	\$655,218 00	\$1,279,543 00
Other property.....	\$5,274,622 00	\$9,091,511 00

DAKOTA.

Education.—The following summary of statistics of the public schools is for the year beginning July 1, 1884, and ending June 30, 1885:

ITEMS.	North Dakota.	South Dakota.	Dakota.
Number of persons, June 1, 1885, over 7 and under 20 years	26,760	60,803	87,563
Pupils enrolled in public schools	19,725	49,350	69,075
Percentage of attendance of those enrolled	63	63	63
Number of teachers employed, total	1,146	2,999	4,145
Average pay of teachers per month, males	\$44.43	\$32.03	\$38.23
Average pay of teachers per month, females	\$34.09	\$28.49	\$31.29
Number of schools, total	895	2,384	3,279
School-houses built during the year	217	698	895

FINANCES.	North Dakota.	South Dakota.	Dakota.
Total expenditures	\$540,430.29	\$1,273,752.18	\$1,814,212.40
Balance cash on hand	182,246.96	145,297.43	327,5.439

There are two universities, one at Vermilion and one at Grand Forks. There is also one agricultural college, at Brookings, and two normal schools, one at Madison and one at Spearfish. In addition to these the School of Mines at Rapid City has been established and will soon be in operation.

The University of Dakota is at Vermilion, and has a faculty of seven members. There are 166 pupils enrolled in all departments, and a steady increase is reported. The University of North Dakota was established by legislative enactment in 1883, and was opened for the reception of students in September, 1884. The faculty is composed of six members. It is at Grand Forks, in the Red river valley. There are about fifty students in attendance. The Agricultural College has a faculty of six members, and there are about 240 pupils in attendance. The university at Mitchell was opened in September, 1885. It is under the management of the Methodist Episcopal Church. Pierre University, at Pierre, on Missouri river, is under the auspices of the Presbyterian Church. It is now in its third year, and has seven instructors. Thirty-five pupils are in attendance. Yankton College is the oldest collegiate institution in the Territory. It was established by the General Association of Congregational Churches in 1881. The faculty consists of seven professors, and 122 pupils are enrolled, twelve of whom are working in the college classes. Dakota Collegiate Institute, at Sioux Falls, is under the control of the Baptist Association.

Care of Insane.—The hospitals for the insane, one conducted on the old plan, and the other on the cottage plan, are successfully carried on, and with results as favorable to patients as in the older asylums of the East. The superintendent of the hospital at Yankton reports the number of patients May 30, 1886, as 124.

The North Dakota Hospital for the Insane

has been but a little over a year in operation, and more room is demanded. There were admitted from April 30, 1885, to June 30, 1886, 14 months, 188 patients. Number discharged, 22; number died, 5; total, 27.

Penitentiaries.—The following report from the Warden of the Territorial Penitentiary at Sioux Falls shows the condition of the prison June 30, 1886:

Number of inmates June 30, 1885	119
Number received to June 30, 1886	88
Total number of convicts during the year	157
Number during the year discharged	65
Remaining June 30, 1886	92

The Warden of the North Dakota Penitentiary, at Bismarck, reports as follows:

Number of prisoners transferred from Sioux Falls, July 31, 1885	35
Number received since from the courts of Northern Dakota	60
Number of prisoners handled	95
Number of prisoners discharged	48
Number of prisoners now here	52

The Black Hills.—There has been but little development even of the gold-mines, the few now in successful operation comprising but a small proportion of the valuable properties known to be in existence and awaiting development. The silver-camps at Carbonate and Galena are not half prospected. The tin discoveries are at this time awakening greater interest and inquiry than the precious minerals. Active operations have been begun, the necessary capital secured, and the early development of the tin-mines seems to be assured. The petroleum found in the Wyoming Hills is said to be fully equal to the best oil produced in Pennsylvania. Wells are now being bored in the oil district, which comprises a considerable area in the western rim of the hills. In the same vicinity there is salt in abundance, which is already finding its way into market. There are extensive mica-mines awaiting the further development which the railroad assures; there is asbestos in large quantities, and copper-mines waiting for the future; besides zinc and saltpeter, now too cheap to be developed at their present disadvantage of location. The Black Hills has the greatest mine of wealth, perhaps, in the almost inexhaustible supplies of building materials of all kinds which are found on every hand.

Railroads.—The year ending June 30 was marked by unusual activity in the construction of new railroads and the extensions of several of the old lines. The increase in mileage foots up 551.77 miles, and is divided as follows:

Burlington, Cedar Rapids, and Northern	9.80
Minneapolis and Pacific	29.64
Fremont, Elkhorn, and Missouri Valley	85.60
Northern Pacific	15.20
Milwaukee and St. Paul	176.60
Northwestern	71.03
Manitoba	163.40
Total	551.77

This increase makes the total number of miles of completed road in operation in Dakota, June 30, 1886, 2,897·67.

According to the returns made by the commission there are in Dakota 344 elevators and 306 warehouses, having an aggregate capacity of 13,843,000 bushels. Of these there are in North Dakota 206 elevators, 54 warehouses, 9,012,000 bushels, and in South Dakota 138 elevators, 252 warehouses, and 4,831,600.

Political.—The Republican Territorial Convention met at Yankton on September 22, and nominated O. S. Gifford for re-election as delegate to Congress. The platform demands "the immediate reduction of all the Indian reservations within the limits of the Territory," and denounces the President's vetoes of pension bills, and the administration of the General Land-Office under Commissioner Sparks. It contains, also, the following planks:

That recognizing the liquor-traffic as an evil, this convention declares in favor of the home as against the saloon, and pledges the party to such legislation as is necessary to protect the people of the Territory from the evil influences of the sale of intoxicating liquors as a beverage.

That the will of the people of all Dakota in favor of division of the Territory, on an east-and-west line, has been so clearly and so frequently expressed during the past fifteen years that there is no reasonable doubt of the determined purpose of a large majority to hold on steadfastly till this purpose is accomplished, and we earnestly ask Congress to pass such a measure without delay, said admission to be on the boundary-line of counties nearest the forty-sixth parallel.

That we heartily believe in the legality of the movement of the people of South Dakota to organize a State government, and that the defeat of the Harrison Senate bill in the House of Representatives was a blow at civil liberty.

The Democratic Territorial Convention met at Aberdeen on September 29, and nominated M. H. Day as delegate to Congress. A resolution favoring admission of the Territory into the Union as a whole was voted down. A resolution favoring the submission of the division proposition to a vote of the people was then adopted. The convention expressed itself in favor of division, and asked that the people confirm that sentiment at the polls.

The platform demands a graduated salary law for all county officers; denounces the Territorial Railroad Commission; demands the taxation of corporation property; asks for a law prohibiting officials from accepting railroad-passes; and calls for the publication of official matter in German and Norwegian papers. Finally, it favors the submission of the prohibition question as applied to the sale of liquor to a vote of the people.

On November 2, Mr. Gifford was elected by a large majority. The Legislature contains very few Democrats.

The total vote for delegate to Congress in 1886 was 104,811, which indicated a population in all of Dakota of 524,055. Of these votes Mr. Gifford, Republican candidate for Congress, received 66,932, and Mr. Day, Democratic candidate for Congress, received 37,879,

giving to the Republican candidate a majority of 29,053. In the south, Mr. Gifford has a majority of 21,023, and in the north a majority of 8,030. In 1884 Mr. Gifford had a majority of 31,117 in the south and 25,554 in the north, making a total of 56,672 in the entire Territory. South Dakota, at the late election, cast 65,765 votes, and North Dakota 39,046. This shows a population of 328,825 in the south half of Dakota, and of 195,230 in the north half of Dakota. The vote in the entire Territory has increased 17,984 in two years. In the south the increase in two years has been 11,196, and in the north, 6,788. In November Governor Pierce resigned, and Judge Louis K. Church was appointed his successor.

Constitutional Convention and Statehood.—The Constitutional Convention, which has been kept alive to provide for emergencies, met in July and adjourned to Dec. 15, when it met at Huron and remained in session two days.

The convention at this session annulled this section, so that the State government may be put in operation irrespective of admission into the Union. The following was passed:

That there shall be held an election, on the Tuesday next after the first Monday in November, A. D. 1887, for all State, legislative, and judicial officers, to fill those offices, the terms of which shall expire by limitation in the year 1887 or 1888; and that, at such election as the State Executive Committee may designate, the State Executive Committee may submit to vote the question, "Shall the State government go into full operation?"

The ordinance then specifies the form of ballot, the canvass of the vote, and the declaration of the result. It declares that if a majority of the votes favor the State government, that government shall go into operation as above specified. It leaves to the State Executive Committee the decision of the question whether there shall be an election.

DAVIS, DAVID, an American jurist, born in Cecil County, Md., March 9, 1815; died in Bloomington, Ill., June 26, 1886. After his graduation, at Kenyon College, Ohio, in 1832, Mr. Davis went to Massachusetts to devote himself to the study of law. After remaining there a short time, he entered the law school at New Haven, Conn., and when his course there was completed, removed to Illinois, and, after admittance to the bar in 1835, took up his residence in Bloomington. In 1844 he was elected to the State Legislature, and in 1847 was a member of the convention that formed the State Constitution. In 1848 he was elected Judge of the Eighth Judicial Circuit, an office that brought him into personal acquaintance and friendship with Abraham Lincoln, who was on the same circuit. Judge Davis was re-elected in 1855 and 1861, but in 1862 he resigned.

In 1860 Judge Davis was a delegate at large to the Republican National Convention held at Chicago, and after the election he accompanied Mr. Lincoln to Washington. In 1862 the President appointed Judge Davis Associate Justice on the Supreme bench of the United States.

After the death of Lincoln, his old friend was asked to administer his estate.

In 1870 Judge Davis, in sympathy with a minority in the Supreme Court, held that the acts of Congress making Government notes a legal tender in payment of debts was constitutional. In February, 1872, the National Convention of the Labor-Reform Party of the United States placed him on its ticket for President. The essential features of the convention were its declaration in favor of a national currency "based on the faith and resources of the nation," a demand for an eight-hour law throughout the entire country, and suggestion as to a method by which the national debt could be paid "without mortgaging the property of the people to enrich the capitalists." In his letter of acceptance, Judge Davis wrote: "Be pleased to thank the convention for the high honor which it has conferred upon me.

DAVID DAVIS.

The chief magistracy of the republic should be neither sought nor declined by an American citizen." The Convention of Liberal Republicans, which met that year in Cincinnati, gave Judge Davis 92½ votes on the first ballot for President; but when the regular Democratic and Republican candidates were in the field, Judge Davis wrote another letter, declining the Labor-party nomination, and refusing to enter the contest. On March 4, 1877, he resigned his seat on the Supreme Court bench, in order to accept a seat as United States Senator from Illinois, having been elected by a combination of Democrats and Independent Republicans in the Legislature of that State. He was considered an Independent, but his support was generally given to the Democratic party. In 1881 he was chosen President of the Senate, when Vice-President Arthur assumed the presidency upon the death of President Garfield; but in 1883 Judge Davis retired from the Senate and from active life, to his home in Bloomington, Ill., where he resided until his death. The degree

of LL.D. was conferred upon him by Wesleyan University, by Beloit College, and by Williams.

DELAWARE. State Government.—The following were the State officers during the year: Governor, Charles C. Stockley, Democrat; Secretary of State, William F. Causey; Treasurer, John M. Houston; Auditor, Nathan Pratt; Attorney-General, John H. Paynter; Superintendent of Free Schools, Thomas N. Williams. Supreme Court: Chief-Justice, Joseph P. Comegys; Associate Justices, William G. Whitely, John W. Houston, and Edward Wooton. Chancellor, Willard Saulsbury.

Finances.—During the past two years the State debt has been reduced only \$15,000. This is principally due to the liberal appropriations for schools, without any proportionate increase in the revenue. The message of the Governor to the Legislature of 1887 reviews the refunding of \$120,000 of the State loan in 4-per-cent. bonds, taken in New York at \$1,05.03. On Jan. 1, 1887, the State debt amounted to \$824,750. This debt is offset by interest-bearing investments, aggregating \$1,168,799. To this may be added: Prospective receipts, amounts due Jan. 1, 1887, \$57,796.31; amount of sinking fund, arising from the oyster revenue, \$4,629.79; balance in treasury belonging to the general fund, \$8,977.86. The report of the State Treasurer shows the receipts and expenditures to be as follow: Receipts—balance in the treasury at settlement with legislative committee January, 1886, \$7,815.49; receipts since that settlement to Jan. 1, 1887, \$121,190.61; probable receipts, due and payable January 1, \$57,796.31; total receipts, present and probable, \$186,802.41. Expenditures—total amount paid out to Jan. 1, 1887, \$120,028.24; leaving a probable balance of \$66,774.17. The sinking-fund biennial collections and outgoes show a balance to its credit of \$4,629.79.

Education.—The Superintendent reports the following statistics: Number of school districts in the State, 422; schools, 562, an increase of 18 since last report; number of months taught in 1886, 8·42, against 7·87 in 1884; white children between the ages of six and twenty-one years, 36,488; colored children, outside of Wilmington, 5,750; white children enrolled, 29,421; colored children, 3,563; average daily attendance, white children, 19,235; colored children, 1,008; average white children to each district, 86; averaged enrolled, 68; average daily attendance, 34; number of teachers, including Wilmington, 635; average monthly salary, \$32.40. Year after year, the report says, shows a gratifying improvement in the school system of the State, and in the interest taken by parents and guardians. In the colored schools substantial and encouraging progress has been made, the schools now numbering 69 outside of Wilmington. During the past year the disbursements amounted to \$7,166.69, of which amount \$4,655.63 came from

the State appropriation, and \$2,511.06 from the school-tax fund.

Insane Asylum.—After referring to arrangements in existence for the reception and care of indigent insane in Pennsylvania asylums, and the failure of those arrangements to give satisfaction, the Governor recommends that buildings be constructed or purchased suitable for a State insane asylum.

State-Prison.—The construction and arrangement of a substantial prison are recommended, wherein convicts can be compelled to labor at regular systematic work from the proceeds of which the expenses of their confinement might be met in whole or in part.

Temperance.—The Governor, in his message, refers to this subject at some length, and urges the enforcement and improvement of existing laws.

Constitutional Revision.—On this subject the Governor says:

For some time past public attention has been called to the subject of revision of the Constitution of our State by means of a convention.

Amendments by the Legislature have great advantages, securing careful deliberation before changing an established law in its separate wants, and without log-rolling. The difficulty is, to devise a plan so that reforms by means of legislative enactments may be more easily attainable. Article IX of the Constitution of the State provides that "the General Assembly, whenever two thirds of each house shall deem it necessary, may, with the approbation of the Governor, propose amendments to this Constitution, and at least three and not more than six months before the next general election of representatives, duly publish them in print for the consideration of the people; and if three fourths of each branch of the Legislature shall, after such an election and before another, ratify the said amendments, they shall be valid to all intents and purposes as parts of this Constitution." I would suggest that if the rate required for ratification was changed to two thirds instead of "three fourths" of each branch of the Legislature, it would enable reforms to be more easily attained, and you would still preserve the wholesome checks on ill-advised and hasty changes.

The same demand exists now as in the past, and I am satisfied is increasing, for a change in the present system of representation. Delay in this matter can not be long deferred. The reform in the judiciary system of the State should be thoroughly considered.

Political.—The Democratic State Convention met at Dover on Aug. 17, and nominated Benjamin T. Biggs for Governor and John B. Pennington for Congressman. The following platform was adopted:

The Democracy of Delaware, through their delegates in convention assembled, declare their adherence to the principles enunciated by the National Democratic Convention held in Chicago in 1884, and insist that their faithful observance in the management of public affairs is essential to proper government and the prosperity and happiness of the American people.

Federal taxation can only be rightfully imposed to provide for the necessary expenditures of the General Government, including the payment of pensions to persons entitled thereto, the maintenance of the public credit, and the gradual reduction of the public debt. We therefore favor such revision and modification of our tariff laws as will relieve the people of the country from unnecessary burdens while providing the necessary revenue to meet legitimate demands upon the Federal treasury.

The Democracy of Delaware, in common with the people of the whole country, recognize in President Cleveland an honest and patriotic Chief Magistrate, anxious to secure a proper administration of public affairs, and entitled to the confidence and support of the American people.

The Democratic party of Delaware points with pride to its management of the affairs of the State for the last thirty years as the strongest possible claim to the continued confidence and support of the people of the State.

The Republicans held no State Convention, and nominated no ticket.

James R. Hoffecker was the candidate of the Temperance Reformers for Governor, and Richard M. Cooper for Congressman. The vote for Governor was 13,943 Democratic and 7,732 Temperance. The Legislature is wholly Democratic.

DENMARK, a monarchy in Northern Europe. The executive power is exercised by the King, with the advice of his ministers; the legislative power by the Rigsdag, or Diet, in conjunction with the King. The King must be a member of the state church, which is the Lutheran Evangelical. The Rigsdag is composed of two houses. The Landsting, or upper house, has 66 members, of whom 12 are nominated by the Crown, and 54 elected indirectly. The Folkething, or popular body, consists of 102 members, elected directly by all citizens over thirty years of age, except paupers and household servants. The members of both houses receive pay. The Landsting selects from among its members the associate judges, who, with the ordinary justices of the Supreme Court, form the Rigsret, which is the highest tribunal, and is alone competent to try impeachments. All money bills must, in the first instance, be submitted to the Folkething.

The reigning King is Christian IX, born April 8, 1818, who was appointed to the succession by the Treaty of London, of May 8, 1852, and succeeded Frederick VII, the last of the direct male line of the house of Oldenburg, on Nov. 15, 1863. The Crown-Prince is Frederick, his son, born June 3, 1843.

The Ministry.—The Council of State consists of the following members: President, Jacob Broennum Scavenius Estrup, appointed June 11, 1875; Minister of the Interior, H. G. Ingwersley, appointed Aug. 7, 1885; Minister of Justice and for Iceland, J. M. V. Nellemann; Minister of Foreign Affairs, Otto Ditlev Baron Rosenørn-Lehn; Minister of War, Col. J. J. Bahnsen; Minister of Marine, Commander N. F. Ravn; Minister of Public Education and Ecclesiastical Affairs, J. F. Scavenius.

Area and Population.—The area of the kingdom is 14,124 square miles. The population of the city of Copenhagen, on Feb. 1, 1880, was, exclusive of suburbs, 234,850; of the Peninsula of Jutland, 865,678; of the islands in the Baltic, 868,511; of the Faroe Isles, 11,220; making the total population 1,980,259, which was divided into 962,832 males, and 1,017,427 females. There were, in 1883, 15,642 marriages, 66,394 births, and 39,323

deaths. The emigration, which is chiefly to the United States, was 6,307 in 1884, against 8,375 in 1883, and 11,614 in 1882.

Finances.—The revenue for the financial year 1885-'86 was estimated as follows:

SOURCES OF REVENUE.	Kroner.
Domains	1,103,596
Interest on reserve fund, etc.	5,450,677
Direct taxes.....	9,332,200
Stamp duties.....	2,629,000
Succession and conveyance dues.....	1,800,000
Legal fees.....	2,018,000
Customs and excise.....	27,963,000
Lottery.....	810,000
Other receipts.....	8,466,756
Total receipts.....	54,575,259

The estimated expenditures for 1885-'86 under the various heads are as follow:

BRANCHES OF EXPENDITURE.	Kroner.
Civil list and appanages	1,223,744
Rigstags and Council of State.....	306,616
Service of the debt.....	8,143,600
Pensions	8,507,266
Foreign Affairs	380,456
Interior	2,373,610
Justice	8,060,973
Public Works and Education	1,663,972
Army	9,190,052
Navy	6,090,895
Finance	8,195,274
Iceland	98,832
Extraordinary state expenditure.....	6,923,759
Extraordinary expenditures on public works, etc..	6,623,962
Total.....	52,787,451

The Government maintains a reserve fund for sudden emergencies. The public debt amounted to 200,855,227 kroner in 1883. About half of this sum is represented by railroads and other capital investments.

The Army and Navy.—All able-bodied Danes from the age of twenty-two are liable to serve eight years in the active army and its reserve, and are liable to service in the case of emergency for eight years more in the extra reserve. The training period is from four to nine months in the various arms, with a second period for the less intelligent and proficient lasting from nine to twelve months. The annual encampments last from thirty to forty-five days. The war strength of the regular army and reserve was in 1884 as follows: Infantry, 26,992; cavalry, 2,180; artillery, 4,755; engineers, 1,363; making a total number of 35,293 men, not including the 1,176 officers. The extra reserve numbers about 14,000 of all ranks.

The navy consisted in the beginning of 1886 of eight armored steamers and 26 others, mostly small, besides 10 torpedo-boats. The "Helgoland" has 12-inch plates, and carries one 36-ton and four 22-ton guns. The "Tordenskjöld" torpedo-vessel has no side-armor, but is divided into water-tight compartments, and carries a 50-ton gun in an armor-protected barbette. Besides this 14-inch Krupp breach-loader she has four of 6-inch caliber, and carries two swift torpedo-launchers and appliances for shooting Whitehead torpedoes.

Commerce.—The total value of the imports in 1883 was 288,514,845 kroner; of the exports, 199,862,572 kroner. The imports of cotton,

linen, silk, wool, hides, and dyes amounted to 51,854,264 kroner, the exports to 17,063,911 kroner; imports of cereals, including meal and malt, to 35,528,046, exports to 30,735,911 kroner; imports of tea, sugar, coffee, tobacco, etc., to 33,483,889, exports to 7,634,841 kroner; imports of metals and metal-wares to 31,030,250, exports to 7,006,814 kroner; imports of wood to 16,393,826, exports to 5,285,596 kroner; imports of fish, butter, cheese, eggs, and bacon to 16,360,245, exports to 50,114,706 kroner; imports of coal to 14,890,701, exports to 1,590,799 kroner; imports of seeds, hops, potatoes, and oil-cake to 13,031,133, exports to 1,136,616 kroner; imports of live animals to 7,415,343, exports to 84,893,585 kroner; imports of liquors to 5,664,986, exports to 2,565,326 kroner. Of the imports German furnished 35·5 per cent., Great Britain 22·7 per cent., Sweden 14·4 per cent., and the United States 6·7 per cent. Of the exports, 41·1 per cent. went to Great Britain, 29·7 per cent. to Germany, 15·1 per cent. to Sweden, and 5·7 per cent. to Norway, while the United States took 1·3 per cent. The most important articles of export are butter and live cattle. In 1881 there were 1,470,079 cattle in the country. The exports of cattle in 1883 were 137,082, the imports 21,560 head.

Navigation.—In 1884, 25,454 vessels, of 3,083,753 tons, were entered, and 24,485, of 3,052,865 tons, cleared at Danish ports. The tonnage under the Danish flag was 1,616,710; cleared, 1,657,827. The number of Danish vessels engaged in foreign commerce on July 1, 1884, was 1,318, with a total tonnage of 264,406; the number of steamers among these was 160.

Railroads.—The length of railroad in operation in 1885 was 1,150 miles, of which 948 miles belonged to the state.

Telegraphs.—The length of state telegraph lines at the end of 1883 was 2,360 miles; the length of wires, 6,532 miles. The number of messages in 1883 was 1,297,484, of which 548,210 were internal, 423,210 international, 25,263 official, and 300,761 in transit.

The Post-Office.—The number of letters and postal-cards carried in 1883 was 30,020,000; the number of newspapers, 33,091,000.

The Colonies.—Iceland, with an area of 39,756 square miles, and 72,445 inhabitants, has its own parliamentary system, established by the Constitution of 1874. The legislative body is the Althing, with 36 members, of whom 30 are elected by the people and the rest nominated by the King. The Minister for Iceland, nominated by the King and responsible to the Althing, directs the administration from Copenhagen through the Governor, called the Stiftamtmand, residing in Reikjavik.

The Icelanders in 1885 distinctly presented the national demand to be emancipated from the bureaucratic rule of Copenhagen. The Althing passed the draft of a new charter, abolishing the Danish Minister for Iceland, and

confiding the chief executive authority under the King to a governor resident there. The proposed revision of the Constitution also provided for the separation of the Althing into two distinct chambers, and for an extension of the electoral franchise. The Danish Government declared that it could not concur in the amendments, but dissolved the Althing, in order to allow the people to express their sense of the proposals, as it was required to do by the Constitution. In the newly elected Althing the proposed constitutional changes obtained an overwhelming majority, the reformers numbering 7 to 1 in the upper and 18 to 4 in the lower division of the Legislature. The Althing was closed on Sept. 8, 1886, a few days after assembling, having firmly insisted on the constitutional revision.

The colony of Greenland had a population of 9,780 souls in 1884. The possessions in the West Indies comprise the islands of St. Croix, 17 square miles in extent, with 18,430 inhabitants; St. Thomas, with an area of 23 square miles, and 14,389 inhabitants; and St. John, with 21 square miles of area, and 944 inhabitants. They are peopled mainly with free negroes, engaged in the cultivation of the sugar-cane, and export from 12,000,000 to 16,000,000 pounds of unrefined sugar and about 1,000,000 gallons of rum annually.

Repressive Measures.—The attempt to assassinate the prime minister on Oct. 21, 1885, gave the Government a pretext to resort to measures of repression and intimidation for the purpose of checking the radical tendencies of popular thought. The Chambers were at once prorogued to the 18th of December. On October 27 a gendarmerie law was enacted by executive decree. On November 2 the rights of freedom of speech and of the press were curtailed, and a control of the trade in weapons was instituted. The rifle-bands, which had begun to form after the infraction of the Constitution by the Government in the matter of the financial law, were rigorously suppressed by virtue of a decree promulgated on May 5. The gendarmerie, or political police, established in this wise, was particularly obnoxious to the country people, who are the strength of the Radical party in Denmark. The corps consists of four divisions of about one hundred and twenty-five men each, distributed over the country in detachments of about twenty-five men. They are under the direction of the Minister of War. Under the provisional press-law, the circulation of an American newspaper, the "Danish Pioneer," published in Omaha, Nebr., was forbidden in September, 1886. In August, 1886, a new provisional enactment was decreed, holding the actual editor of a newspaper responsible for its publications, and providing that the property can be levied upon if a fine is not paid. In October, 1886, the editor of the Socialistic organ was convicted under the provisional law of the previous November, though it had been rejected by Par-

liament, of exciting one class against another, a description of crime that was borrowed from German jurisprudence.

The Trial of Berg.—During the agitation that followed the unconstitutional promulgation of the budget law in the spring of 1885, the Government ordered police officers to attend political meetings. The officers presented themselves at the assemblages of the Opposition party in uniform and took their places on the platform. When Herr Berg, President of the Folkething and leader of the United Left, came before a meeting at Holstebro, a small town in Jutland, in June, 1885, he refused to speak unless the chief of police retired from the platform. The latter refused to step down at the request of the committee, and finally two of them removed him by force. Berg in his address affirmed that this act was perfectly legal. He was arraigned with the two committee-men in October before the judicial commission, under a clause in the penal code making it criminal to obstruct a public officer in the execution of his duty. All three were condemned to six months' imprisonment, with common prison-fare. When the Folkething reassembled a few days later, Berg was again demonstratively voted into the chair. He had pleaded that he had not incited nor taken any part in the act; yet when the case was finally decided on appeal by the Supreme Court on the 11th of January, 1886, the sentence was confirmed in the case of all three of the accused. The conviction of Berg was decided by the casting vote of the presiding judge, the other twelve being evenly divided. On January 13 he announced that he would be compelled to vacate his office in order to serve the criminal sentence, but was re-elected by the vote of 71 out of the 86 deputies; yet while the Rigsdag was in session he was taken to prison. Herr Horup, the Vice-President, took his place as Speaker, and not many days afterward was himself tried for insulting the King in his newspaper, and condemned to pay the costs of the trial. On February 8 the Rigsdag was closed, and a provisional budget for 1886-'87 decreed.

The Constitutional Conflict.—The clause in the charter empowering the Government to enact provisional laws in urgent cases, when the Rigsdag is not sitting, requires such laws to be submitted for ratification at the next session of the Legislature. The provisional money bill that was promulgated by royal decree on April 1, 1885, the same day on which the Rigsdag was closed by the Government, differed from previous provisional finance laws in authorizing expenditures that the Folkething had objected to. In compliance with the constitutional requirement, the ministry submitted the provisional finance law of April, 1885, to the Folkething, where it was rejected on Jan. 25, 1886. The Government then determined to usurp the legislative powers, and refused to recognize further acts of the Folkething. A

royal decree was issued on Jan. 26, authorizing the Government to raise taxes and defray current expenses, although the charter forbids taxes to be raised before the budget has been passed. The Government did not professedly abrogate the Constitution, but defeated its main provisions by new interpretations, which even the principal jurists of the Ministerial party condemned. Parliament was immediately prorogued, because the ministry desired to keep up the pretense of parliamentary government by obtaining the indorsement of its acts by the Landsting. The provisional laws restricting the sale of arms, suppressing volunteer military bodies, establishing a military constabulary, restricting the freedom of speech, and authorizing the Minister of Justice to incur whatever expenditure he thinks fit for the police, were ratified by that branch of the Legislature. The ministers did not submit these bills to the Folkething, but, exercising their right of initiation, members of the majority proposed them, and they were rejected in due form. The budget was not submitted to the Folkething, the finance minister defending his action in bringing it forward in the Landsting with the argument that an identical budget had been already acted upon by the lower house. The session was closed on Feb. 2. The Folkething defeated the measures proposed by the ministry, which rejected, on its part, all those that were carried in the popular chamber, where there were 83 members in opposition and only 19 Ministerialists. Of 41 bills brought forward on both sides, only one was passed.

The main point of difference between the ministry and the popular party is the question of taxation, which is becoming more urgent under the conditions of depression in agriculture, trade, and manufactures that prevail, and are aggravated by the bitterness of the constitutional struggle. The ministry has on its side only the great landlords, who aim at the restoration of the political powers and immunities that were taken from them in the reform reign of Frederick VII, the bureaucracy, and middle-class people of aristocratic sympathies, while the popular party embraces almost all the farmers, all the workingmen, and a large part of the trading and manufacturing community. The Government has received each year a considerable surplus of taxes over the expenditure. In 1884-'85 the aggregate revenue amounted to 57,000,000 kroner, while the expenditure was 48,000,000 kroner. The annual receipts in excess of requirements have rolled up the balance in the treasury from 23,000,000 kroner in 1877 to 59,000,000 kroner on March 31, 1885, while large sums have been applied to paying off a part of the national debt, and to railroads and other public works. The people demand a reduction of taxation, especially where it presses unequally on the poorer classes. The ministry is willing to agree to a revision of the tariff and the abolition of the

navigation tax, which hampers foreign shipping, but insists that the treasury must be compensated by the imposition of new taxes yielding an equal amount of revenue. The customs tariff of 1863 taxes heavily the most important and most necessary articles of consumption: also raw materials, such as coal, timber, and metals. The duties were increased by the war-tax of 1864, intended to cover the losses of the war with Germany. These extraordinary taxes have already yielded more than enough to compensate the treasury for the war expenditure. The finance minister, Estrup, refuses to relinquish the unnecessary imposts, because the Government is likely to require the surplus for increased military and other expenditures. The project for national defense works was rejected in 1876, and the people sustained the action of the Folkething by returning a majority of three fourths against the Government. The Folkething has been willing to vote considerable sums for military purposes, but rejects the project for fortifying Copenhagen on the land side as unreasonable and incommensurate with the resources of the country, if not useless for practical defensive purposes. The Government proceeded this year to treat this repeatedly rejected scheme as an urgent matter of current expenditure, which the Executive was authorized by the Constitution to provide for. The King, on April 2, approved the budget in the form in which it had been voted by the Landsting, showing a surplus of 300,000 kroner, and authorized extraordinary expenditures by the war ministry of 3,000,000 kroner for forts and 500,000 kroner for guns, and by the naval ministry of 3,000,000 kroner, of which 1,200,000 kroner were for torpedo-boats and mines.

Session of 1886-'87.—The budget laid before the Folkething at the opening of the new session in October, 1886, placed the revenue at 53,391,000 kroner, and the expenditure at 62,500,000. The deficit, caused by extraordinary expenditure on fortifications, the ministry proposed to cover by drawing on the balance in the treasury. The Minister of War, who in 1884 estimated the cost of fortifying Copenhagen at 33,000,000 kroner, now demanded 31,500,000 kroner for the works on the land-side, and 14,666,000 kroner for the maritime fortifications, the expenditure of the first sum to be spread over five years, and of the second over seven. The Folkething stood firm in its refusal to accept the plan of the Government for the fortification of the capital, which, it was expected, would cost from 90,000,000 to 150,000,000 kroner, yet voted an exceptionally large budget. The provisional financial law for the current year was declared to be unconstitutional, and was rejected by 72 to 17 votes. The lately issued provisional laws regarding the responsibility for newspaper articles and the reorganization of the criminal and police courts were also refused the sanction of the Legislature. The strife between the ministry and the

Chamber that was elected in 1876 was finally ended by the dissolution of the Rigsdag on Jan. 8, 1887. The new elections were appointed for Jan. 28.

DISASTERS IN 1886. The disasters of the year have been marked by the somewhat unusual violence of storms and earthquakes. The following list includes those that have been conspicuously fatal to human life, on land and sea. Accidents where only a single life has been lost are generally omitted, though in the aggregate they no doubt largely exceed the more startling disasters that involve the death or injury of many persons. On railways, for instance, there are here specified only 24 accidents, with 127 killed and 214 injured. There were, in fact, in the United States and Canada, 1,211 accidents, 401 killed and 1,433 injured.

January 1. Fire; seed-warehouse burned in Detroit, estimated loss \$1,500,000; 1 fireman killed, several injured.

3. Earthquakes and violent atmospheric disturbances in the Argentine Republic.

4. Railway; bridge breaks near Duncannon, Pa.; 4 killed, 5 injured.

5. Floods in Pennsylvania coal-regions; heavy losses in Williamsport, Pottsville, Shenandoah, and vicinity.

9. Destructive storm all over the northern United States and Canada; many lives lost by wrecks and otherwise. Railway collision near Wilmington, Del.; 3 killed, several injured.

10. Railway; bridge breaks near White's Station, Ala.; 3 killed, 21 cars burned. Fire in Philadelphia; estimated loss, \$1,500,000. Shipwreck; British steamer Hylton Castle founders at sea; all hands saved.

11. Fire; flour and woolen mills in Chicago; loss, \$800,000.

13. Explosion in a colliery at Evanston, Iowa; 13 killed. Railway collision near Michigan City, Ind.; 4 killed. Fire in Montreal; loss, \$500,000. Shipwreck; Norwegian bark Kroljevike; 7 of crew and 8 life-saving crew lost.

14. Earthquake in Amatitlan, Guatemala. Railway accident in Peru; 30 soldiers killed. Shipwreck; Gloucester fishing-schooner Mabel Dilloway; 16 lives lost.

15. Railway collision near Harper's Ferry, Va.; 3 killed. Frozen to death; 3 persons in South Carolina, and 3 in Virginia.

16. Railway-train derailed near Pelhamville, N. Y.

17. Explosion; fire-damp in Almy mine, Wyoming; 13 killed.

20. Railway; train derailed near Albany, Mo.; 1 killed, 14 injured.

21. Explosion; fire-damp in Orrell coal-mine, Newburg, W. Va.; 39 killed.

22. Storms in the West; several lives lost by flood and avalanche.

23. Explosion; locomotive-engine at Madison, Wis.; 1 killed, several wounded.

26. Fatal snow-slides in Colorado.

30. Falling houses in London, England; 6 killed. During the month 8 persons were killed and 20 injured in the Pennsylvania coal-regions.

February 2. Shipwreck; American steamship Rapidan sails from New York; never heard from; about 20 lives lost.

3. Explosion; a large quantity of dynamite near Fordham, N. Y.; 1 killed, several injured, and many buildings damaged.

4-7. Severe storms; causing much damage in the United States, and many shipwrecks at sea and on the lakes.

10, 11. Severe rain-storms throughout the Northern States; much damage from floods and wash-outs.

10. Explosion; boiler in Boston; 5 killed.

11. Shipwreck; bark Karl on Barnegat Shoals, N. J.; 10 men drowned, including 3 of the United States life-saving crew, who went to the rescue.

13-15. Floods in the North Atlantic States; heavy damages in Boston, Providence, and Fall River; several lives lost.

15. Shipwreck; British steamer Douglass, at Swatow; 18 lives lost.

16. Fall of building in Liverpool, England; several killed; 18 severely injured. Fire in Plymouth, Wis.; 5 lives lost.

17. Shipwreck; Austrian ship Miroslav sails from Philadelphia; never heard from; 20 lives lost.

26-28. Wind-storm of great severity (85 miles an hour) in the North Atlantic States; many shipwrecks and much damage by wind.

26. Shipwreck; steamer Idlewild, near Stamford, Conn.; 8 men missing. Railroad-train derailed by cattle; 2 men killed, 21 injured.

March 2. Railway; trains derailed near Belleville, Ontario, Bethel, Me., and Fish's Eddy, N. Y.; 11 killed, 17 injured. Shipwreck; American bark Surprise, on the coast of Madagascar.

4. Fire; oatmeal-mills in Akron, Ohio; loss nearly a million; small insurance.

8. Explosion; Dunbar, Uniondale mine; 2 killed. Explosion; steam-tug Rifleman, in Cardiff harbor, Wales; all hands killed—6 men, and 1 killed on an Italian ship a quarter of a mile distant by falling débris. Fire; destruction to shipping in Jersey City.

12. Railway, Monte-Carlo, Mentone; 5 killed. Railway; derailment near Eckford, Mich.; 1 killed, 29 injured.

14. Shipwreck; British steamer Oregon sunk by collision with unknown vessel off Fire Island at early dawn; 600 passengers; all hands saved. British steamer Beda founders off Cape Perpetua; 12 lives lost.

19. Disastrous floods in Germany.

20. Explosion on steamer Columbia at the island of Tumaco; 15 killed. Floods; great damage in the Southern States.

21. Fire; in Helena, Ark., the business portion of the town burned.

31. Railway; derailment near Huntingburg, Ind.; 1 killed, 25 injured.

April 7. Railway; train derailed near Deerfield, Mass.; 12 killed, many injured. Derailment near East Saginaw, Mich.; cause, wind; 11 injured.

14. Railway; derailment near Oskaloosa, Neb.; 2 killed, 13 injured. Tornado; towns of Sauk Rapids and St. Cloud, Minn., wrecked; 70 killed, many injured, and much property destroyed.

17. Fire; the town of Stry, Galicia, nearly destroyed; 128 lives lost.

20. Flood; dam gives way near East Lee, Mass.; 7 drowned; much loss of property.

May 1. Fire; town of Akita, Japan, almost totally destroyed; 3,000 houses burned.

6. Storm, wind, rain, and hail in Kansas City; 20 killed; much damage done.

12. Hurricane in Spain; 82 killed in Madrid; 620 injured. Storm in Ohio and Indiana; 24 killed at Kansas City, 30 injured.

24. Railway; collision near Brompton, Ont.; 40 injured.

29. Drowned; Rev. C. Jerome, his 3 children and a visitor, in Lake Winnebago, N. H.

31. Boiler-explosion at Palestine, Texas; 2 killed, 17 injured. Lost at sea; British steamer Lyceum, with 70 persons on board, off the coast of Australia.

June 3. Railway; collision near Waldron, Ill.; 3 killed, 24 injured. Yellow-fever epidemic at Colon.

7. Railway; derailment near Santee Swamp, S. C.; 7 killed, 18 injured. Fire; in Chicago; 8 lives lost.

9. Fire; glass-factory in Montreal; loss, \$140,000.

10. Volcanic disturbances in New Zealand; 21 killed; much property destroyed.

14. Gale; Galveston, Texas, inundated; much dam-

age, and several lives lost, by wind and sea. Fire; city of Vancouver almost totally destroyed.

25. Explosion in colliery near Rochamp, France; 24 killed.

July 2. Explosion; dynamite in Atlantic Company's works near McCainsville, N. J.; 10 killed. Shipwreck; 8 French torpedo-boats founded in a storm in the Atlantic; 50 lives lost.

5. Fires; Harlem, N. Y.; loss, \$200,000; Cohoes, N. Y.; loss, \$200,000; Chicago; 2 killed, 4 injured; loss, \$30,000. Railway; collision in Scotland, between Edinburgh and Glasgow; 35 injured.

7. Earthquake at Malaga.

15. Explosion; an old artillery shell in St. Petersburg, Russia; 16 killed, several injured.

19. Gale on the North Atlantic coast; much damage at Far Rockaway, N. Y.

28. Fire; theatre at Tinnevelly, British India; about 100 lives lost.

30. Shipwreck; American schooner Sarah Craig, with pleasure-party of 11 persons on board, capsized off Sandy Hook; 7 drowned.

31. Explosion (supposed malicious intent); dynamite, at Reading, Pa.; church blown up. Floods; great damage and loss of life in the New England and Middle States.

August 4. Drowned; 7 members of one family in the harbor of Portland, Me.

9. Earthquakes continued in New Zealand.

11. Tornado in central New York.

12. Shipwreck; two yachts capsized near Boston; 10 drowned.

13. Explosion; in Woodend colliery near Leigh, Lancashire, England; 36 killed.

15. Hurricane; Newburg, Ind., destroyed.

17. Earthquake in Malta.

20. Hurricane in the Gulf of Mexico, and 200 miles inland, along the coast of Texas; 38 lives lost. Galveston suffered most severely, and property was destroyed to the estimated value of \$5,000,000.

21. Fire in San Francisco; estimated damage, \$2,000,000.

23. Flood; Irrawaddy River, Burmah, bursts its banks, and floods the city of Mandalay; 25 lives lost.

25. Railroad; runaway train near Saluda, N. C.; 5 killed, 8 injured; most of them convicts. Shipwreck; French ship L'Etoile, strikes a reef and sinks at once; 12 lives lost. Horses run away with a carriage containing Senator W. M. Evarts, Judge Stanley Matthews, C. C. Perkins, and Miss Matthews; Mr. Perkins killed, and all the rest injured.

28. Earthquake in Greece, affecting the neighboring islands; 600 lives lost; several towns destroyed.

29. Fire; steamer Daniel Drew burned at her moorings near Kingston, N. Y.

30. Explosion; fire-damp in Fairlawn Colliery, Scranton, Pa.; 5 killed. Railway; collision near Vienna, Austria; 7 killed.

31. Earthquake; central in South Carolina, but affecting nearly all the territory of the United States east of the Mississippi River. In Charleston, nearly every building was damaged, and some were thrown down; 61 lives lost. The shocks continued with decreasing violence for about two months.

September 4. Yellow fever at Biloxi, Miss. Fires in Jersey City, N. J.; Milwaukee, Wis.; Pittsburg, Pa.; and Long Island City, N. Y.

5. Railway; collision near Curtis Bay Junction, Md.; 15 injured.

12. Panic in Pilgrimage Roman Catholic Church, Radna, Transylvania; 15 killed, 100 injured.

13. Mine caves in near Scranton, Pa.; 1 killed, 6 buried, but afterward rescued.

14. Railway; collision on the New York, Chicago, and St. Louis Railroad, called the "Nickel Plate," 30 miles west of Buffalo. Baggage and smoking-car telescoped; 13 killed, 7 fatally injured, 12 seriously.

16. Tornado; Illinois, Indiana, Wisconsin, and Michigan; several towns wrecked, and lives lost.

24. Lightning; 5 oil-wells set on fire at Lima, Ohio,

27. Fire; 30 buildings burned at Deland, Florida. 30. Explosion; powder-works near Baychester, N. Y.; 4 killed.

October 3. Explosion; fire-damp in a colliery near Wakefield, Yorkshire, England; 24 killed.

5. Explosion on steamer La Mascotte, near Neeley's Landing, Cape Girardeau; 22 killed.

12. Gale in Gulf of Mexico, Sabine Pass destroyed; 102 lives lost; Johnson's Bayou, La., destroyed; 145 lives lost.

14, 15. Hurricane in Great Britain, much damage done, and many lives lost. Fire; a large part of Eastport, Me., burned.

21. Explosion; 600-pound shell at Sandy Hook Government experiment station; Lieut. Metcalfe and Private King killed; several injured.

28. Railway accident near Rio, Wis.; 13 killed.

30. Shipwreck; Cunard steamer Pavia struck a rock and had to be beached in Boston Harbor.

November 3. Railway accident between Nicolaief and Odessa; 40 soldiers killed.

9. Explosion; 3 powder-houses near Lake Hatcong.

11. Floods in the south of France.

14. Explosion on Chinese steamer Tokatman, off Niigata; 96 lives lost.

15. Shipwreck; steamer Normantore founders off Pashima, Japan; 60 lives lost.

16. Fire; town of Durham, N. C.; business section burned; loss, \$500,000.

17. Fire in Baltimore; 3 firemen killed by breaking of ladder. Town of Salisbury, Md., almost wholly burned.

17-23. Storms; terrible gales on the Great Lakes; about 30 vessels wrecked; 50 lives lost.

24. Fire at Forsyth, Mo.; estimated loss, \$390,000.

25. Explosion; tug Sunbeam in East River, N. Y.; 6 killed.

27. Shipwreck; British steamer Westernland; struck by a sea; deck crushed in; 6 men killed, 18 injured. Fire; grain-elevators burnt at Duluth; 3 lives lost; estimated damage, \$850,000.

29. Shipwreck; life-saving crew at Point au Sable, Mich., answer false signals of distress from a schooner; 3 drowned.

December 3. Fire; town of English, Ind., nearly destroyed.

4. Railway; collision near Balcony Falls, Va.; 4 killed.

9. Explosion; locomotive-engine, near Jersey shore, Pa.; 4 killed.

10. Railway; collision near Memphis, Tenn.; 4 killed—viz., the conductor, and 3 tramps, who were stealing a ride.

14. Railway; broken bridge near Chapel Hill, N. C. The whole train fell 20 feet; 5 injured; car took fire.

22. Railway; train derailed near Henderson, N. C.; 11 injured.

25. Explosion; kerosene at Newberne, N. C.; 3 houses burned; 2 lives lost.

31. Railway; collision near Devil's River, Texas; 5 killed, 10 injured.

DISCIPLES OF CHRIST. The Disciples of Christ, while they have no general official organization, are represented in general missionary work by three voluntary societies, viz.: the General Christian Missionary Convention, which was organized in 1849 as the American Christian Missionary Society, and reorganized under its present name in 1881; the Christian Woman's Board of Missions, which was organized in 1874; and the Foreign Christian Missionary Society, organized in 1875. The first society labors chiefly in the United States, the third in foreign countries, and the Woman's Board co-operates with both. The annual

meetings of the three societies were held in Kansas City, Mo., October 19 to 23.

American Christian Missionary Society.—The Rev. Isaac Errett presided over the meeting of the American Christian Missionary Society. The report of the Executive Board showed that thirty-two missionaries had been laboring under its direction in Arkansas, Alabama, Arizona, Colorado, California, Florida, Dakota, the Indian Territory, Kansas, Massachusetts, Mississippi, Minnesota, Nebraska, South Carolina, Wisconsin, and Washington Territory. They returned, as the result of their efforts, 19 churches organized and 1,549 additions. The work of this board was supplemented by that of State organizations in 36 States, employing 181 missionary agents, who returned 62 churches organized; 3,770 converts baptized; 2,618 other additions; and \$97,388 of contributions for home missions. The financial statement of the General Board showed that the amount of the contributions was steadily increasing. Since the organization of the society and the State associations more than \$1,560,000 had been collected and expended for carrying out their objects.

Foreign Christian Missionary Society.—Gen. F. M. Drake, of Iowa, was President of the Foreign Christian Missionary Society. Its receipts had been \$64,556. It had 43 missionaries employed at 24 stations in France, Denmark, Turkey, England, India, China, and Japan, and returned 537 conversions during the year.

Woman's Board.—The Christian Woman's Board returned 539 auxiliary organizations, 117 of which had been formed during the year, and an income greater than had been received in any previous year. It has charge of the children's organizations in the Sunday-schools, which, beginning with the gift of \$754 in 1881, when they were first formed, have increased their contributions at an average rate of about \$1,000 a year, till, in 1886, they amounted to \$6,035. These offerings are devoted principally to assisting in the support of the missions in India, China, and Japan.

Report on Union with Free-Will Baptists.—Progress was made at the meetings in the conferences for union with the Free-Will Baptists, in furtherance of which a committee had been appointed at the preceding meeting of the General Convention. The committee reported, saying that, in all overtures for union with other bodies, it was assumed that the Word of God would be accepted as the only and all-sufficient rule of faith and practice, and that all utterances would be conformed to this standard of doctrine and worship. Granting this as a basis, union was not only desirable, but an imperative duty. All intercourse should be had with this object in view, and adjustments of relations between Free-Will Baptists and Disciples in the same localities could be made without sacrificing principles, so as "to insure harmonious action and unity of worship, and thus secure immediate co-operative union

and ultimate organic union." The report then considered what applications of names would be proper; what should be the conditions and forms of the admission of members; advocated a weekly communion; advised the union of the members in each locality in supporting a good and capable man as preacher, recognizing his standing in the Christian ministry, regardless of past affiliations, who would prudently regard the points of adjustment and the Scriptural standard of doctrine. As to co-operation, the report continued, "Let the several congregations exercise their liberty in sending messengers to associational or conventional meetings of the two bodies as now constituted, and contribute to the enterprise of either or both bodies at the pleasure of individual contributors." These propositions had been submitted to the Free-Will Baptist General Conference in the previous week, and had been, according to the committee's account, favorably received by the members of the same, and responded to by the appointment of fraternal delegates to attend the next General Christian Missionary Convention. The committee was continued.

DRUGS, NEW. Acetophenone (called also, for sake of brevity, *hypnone*) is found to be a very powerful producer of sleep, in doses of one to three grains, for adults, best given with glycerin and in gelatin-capsules. It is preferable to chloral or paraldehyde in cases of alcoholism. Hypnone is best prepared by distilling a mixture of benzoates and acetates of calcium, or by the action of zinc methyl on benzoyl chloride. It forms large, crystalline laminæ, melting at 57° Fahr.; has a sp. g. of 1.032 at 60° Fahr., and by oxidation is converted into carbonic and benzoic acids. Further trials do not substantiate its claims as a sleep-producer, and its creosote-like flavor is often an objection to its use.

Antifebrin is a new derivative of aniline, the scientific name being acetanilide, or phenylacetamide ($\text{NHC}_6\text{H}_4\text{CO}_2\text{H}_2\text{O}$). Its value consists in its power of reducing fever, it being estimated as four times as great as that of antipyrin. It is made by heating aniline and glacial acetic acid for forty-eight hours in a flask provided with an upright condenser, then distilling, when acetanilide is obtained in an impure state, and then purified by crystallization from benzol or boiling water. It is a white, crystalline powder, without odor, and has a burning taste; melts at 101° (or 112°) C., soluble in 189 parts cold water at 42.8° Fahr., and more soluble in alcohol or ether; not precipitated from the former by addition of water; soluble in benzoin, benzol, and essential oils; neutral; not affected by alkalies, unless they are very concentrated, nor by sulphuric or hydrochloric acids. It forms no salts. Its dose is five to thirty grains *per diem*, and its effects are apparent in about an hour; highest in four hours. It rapidly lowers the temperature in fever, and abates or stops the pain in acute rheumatism. A dose which is

strong enough to lower the temperature, keeps it thus for six to eight hours, and causes no stomach disturbance. The wholesale cost is about four dollars per pound in Germany—where, only, it has thus far been made. It is administered mixed with water, or wine, or in wafers.

Arekaine, reported to be a constituent of betel-nut, is a colorless, volatile, oily alkaloid, smelling like weak meat-broth, and having a strong alkaline reaction. Its use retards the pulse, purges, and increases the flow of saliva.

Asiminine, lately discovered and named by Prof. J. U. Lloyd, is derived from *Asimina triloba*. Its use on animals is followed by a state of excitement followed by one of sleep, passing into stupor and insensibility, respiration becoming rapid in the first and slow during the second stage. It is a possibly valuable addition to the list of hypnotics and anodynes. The alkaloid is prepared from the seeds, and is white, colorless, tasteless, and practically insoluble in water; freely soluble in ether and alcohol, and less freely in chloroform and benzol. The usual alkaloidal salts are freely soluble in water, excepting the hydrochlorate, which is less soluble, but the most available owing to facility of production. The hydrochlorate is white, odorless, and has at first a sweetish, then a bitter flavor. Solutions of all its salts are bitter.

Buxine, the active principle of *Buxus sempervirens*, is found to be identical with the berberine of *Nectandra*, and pelosine, of Pereira. It is bitter, colors litmus-paper blue; is soluble in alcohol, less so in ether, and almost insoluble in water, and is decomposed by nitric acid. Courbe prepared it by boiling with magnesia a watery solution of alcoholic extract of box, dissolving the precipitate in alcohol, decolorizing with animal charcoal, filtering, and evaporating. Barbaglia's process is to treat the leaves and stalks with dilute sulphuric acid; precipitating with excess of carbonate of soda or of lime, and drying the precipitate at moderate temperature, when it is acted upon by absolute alcohol; the alcohol is distilled off, and the residue again treated with dilute sulphuric acid, and again precipitated by an excess of carbonate of soda or lime at a temperature of 40° to 50° C. A current of carbonic-acid gas being then passed through the mixture, redissolves buxine as bicarbonate, and separates a resinous substance. The solution is neutralized by ammonia, and the buxine separates in perfectly white condition. It is used as a remedy for ague. Its salts are very bitter, and form gelatinous precipitates with alkalies.

Caeur is an African fruit derived, it is believed, from *Cucumis myriocarpus* (Naudin), a green annual common to Cape Colony and the Free States. The plant produces fruit abundantly, in form sub-globose, about the size of a large gooseberry, and weighing sixty to one hundred grains. It is beset with soft and

short prickles. A section shows three parietal placentæ, numerous seeds imbedded in a soft, viscid pulp, which becomes mere fluid when warmed. The pulp is bitter and has the odor of cucumber. It is one of the most commonly employed of the many emetics used by Caffres, who heat the green fruit, and squirt the contents into the mouth, vomiting occurring about fifteen minutes after swallowing.

Chrysophan, according to Dr. Kubli, is present in some varieties of rhubarb; and chrysophanic acid, heretofore believed to be a constituent, is really the product of a chemical change produced by water. This accounts for the deposition of the acid in dilute alcoholic extracts.

Conessine has lately been produced from the bark of *Holarrhena Africana* (D. C.), in considerable quantities, the conessa-bark (or *Cortex antidysertericus*) containing about ten per cent. Aside from the value of the bark as a remedy for dysentery, the alkaloid is peculiar (like *aribine*) in containing no oxygen.

Francisceline, an alkaloid derived from the manaca-root of Brazil (*Franciscea uniflora*, et al.), is reputed to be a stimulant to the action of the bowels, kidneys, skin, and uterus.

Gelosine is the name given to the jelly made from a Japanese alga (*Gelidinum cornutum*), and used as a vehicle for external medication, rather than on account of inherent medicinal properties. It mixes with all pharmaceutical substances soluble in alcohol or water. It is procured in the market in the shape of whitish leaves or films, and absorbs an immense proportion of water (550 times its weight), which it extrudes as it dries. In practice it is soaked in an equal weight of hot water, and the medicinal element is then incorporated with it; when, on cooling, it reaches sirupy consistency, it is poured into molds. It is not liable to putrefaction.

Ichthyol, a peculiar product obtained from bituminous rock found near Seerfed, in Tyrol. A tarry product, of offensive odor, results from dry distillation in iron retorts, and separates, by standing, a fluid, dark-colored oil. This, being treated with sulphuric acid, liberates sulphurous acid. The product is neutralized with an alkali, and the resulting salt contains about 10 per cent. of sulphur in combination. The ammonium salt, which is the one now generally used, is really the sulpho-ichthyolate of ammonia, and is employed as a local application in skin-diseases. It is a reddish-brown, clear, sirupy liquid, with empyreumatic, bituminous odor and taste. Soluble in water, and in a mixture of equal volumes of alcohol and ether, but slightly soluble in pure alcohol or ether. Oil of lavender is said to disguise its odor best.

Iodol is at present prepared from the volatile oil known as "Dippel's Animal Oil." The pyrrol, which this oil contains, is freed as much as possible from accompanying substances, and its solution is then treated with a solution of iodine and iodide of potassium. Tetra-iodo-

pyrrol is deposited in crystalline state, and four molecules of hydriodic acid are produced. Iodol is the abbreviated name for this substance. It appears as a light-brown powder, darkening by exposure to light; is almost tasteless, with a faint odor of thymol. Examined with a microscope, it is a *débris* of fragments of lamellar and columnar crystals of light-yellow color. Up to 212° Fahr. it does not appear to alter nor to lose weight, but above that degree of heat it gives off iodine, and leaves a bulky charcoal, reducible with difficulty to ash. It requires 5,000 parts of water for solution, but only 3 parts of absolute alcohol. It is not very soluble in glycerin, but requires less than its weight of ether. It contains 88·9 per cent. of iodine (iodoform has 96·6 per cent.). It was discovered by Drs. G. Cianician and P. Silber, of Rome.

Kava-kava, or **Piper methysticum** (Forst.), contains in its root a resinous substance which has been found to produce local anaesthesia. Its taste is aromatic, followed by a sense of prickling and burning, which is soon lost in local insensibility. Injected under the skin the tissues become insensible, and its effects are not followed by inflammation. The constituents of the root are a resin, kawin; a neutral substance, kawahin (or methysticin), and an ethereal oil. Kawahin can be separated in the form of white, needle-shaped crystals, and from the mother-liquor another crystalline substance, called tangarin, can be produced. The medical virtues appear to reside in the resin, and not in the crystalline bodies, and this is divisible into an alpha-resin and beta-resin: the α -kawa-resin possesses the odor and flavor of the drug; is soluble in alcohol, chloroform, and ether; imparts its odor to water boiled with it; leaves a permanent, oily stain on paper; boiled with water the latter turns yellowish-green, and oily particles collect on the surface; on cooling the liquid becomes milky. The α -kawa-resin costs about one mark per gramme; the β -resin about 0·30 mark. The anaesthetic effect of the α -resin is greatest. Even a minute portion placed on the tongue causes first a fatty or soapy taste, followed by numbness and loss of sensibility in the surfaces with which it comes into contact. There is slight paleness of the membrane, and these effects last ten or more minutes.

Kelline is a ternary substance derived from kella-seeds (*Ammi visnagra*). A decoction of the seeds has been used as a remedy for rheumatism and urinary gravel, and ointment made with the seeds as an application to rheumatic joints.

Lactate of Morphine is the only salt of morphine which crystallizes from water in an anhydrous condition. Its formula, according to D. B. Dott, is $C_{17}H_{19}NO_3.C_6H_6O_3$. It is soluble in 8 parts of water and in 93 parts of alcohol of sp. g. 0·888 at 60° Fahr.

Lanolin, a fatty substance, derived from sheep's wool, differs from the ordinary or

glycerin fat, in having cholesterine as a base. The crude fat is known as suint. The name is derived from *lana*, wool, and *oleum*, oil. It is produced by emulsifying suint, and then churning it, when the lanolin separates. It is capable of absorbing more water than any other known fatty body, more than 100 per cent. being incorporated with it by kneading. It does not dissolve in water, and forms a thick milk with soap or alkalies. It is absolutely neutral, and is not capable of spontaneous decomposition. It mixes readily with glycerin, and forms an admirable basis for ointments containing remedies to be introduced through the skin, owing to the rapidity with which it is absorbed. It has little or no odor.

Lantanine, an alkaloid recently found in *Lantana Brasiliensis* (family *Verbenaceæ*), is said to moderate the circulation, retard nutrition changes, lower the temperature, and, in doses of 30 grains, conquers intermittent fevers that have resisted quinine. It does not disturb the stomach. Dr. Buisa, of Lima, is its discoverer.

Myrtol (presumably the stearopter of oil of myrtle, from *Myrtus communis*), is lately proposed as an antiseptic and disinfectant. About 2½ grains in capsules, before meals, is recommended by Dr. Linarix as a remedy in subacute and chronic bronchial catarrh.

Osmate of Potassium ($K_2O_2O_2\cdot 2H_2O$), is a salt of osmium, used in place of osmic acid, by hypodermic injections, for the relief of peripheral neuralgias and rheumatic sciatica. A 1-per-cent. aqueous solution is employed. The salt has also proved serviceable as a remedy for epilepsy.

Piperonal, an aldehyde corresponding to piperonic acid, is obtained by the oxidation of piperine. It forms small, white, prismatic scales, having an odor of heliotrope, in consequence of which it is sold under the name of heliotropin. It melts at 125° Fahr., and volatilizes completely at a higher temperature. It is insoluble in cold water. In hot water it melts to a condition of oily drops. Ether and alcohol dissolve it readily. It has some power of reducing the temperature of fever in doses of fifteen grains every two to four hours, but its chief value is as an antiseptic.

Rubus Chamæorus, or cloud-berries, is a Russian peasant-remedy for increasing the flow of urine, which has lately received scientific attention. Its virtues are imparted to water or alcohol, and its effect on the kidneys does not appear to be attended with increased arterial pressure.

Saccharinates of quinine, strychnine, and other bitter alkaloids—made with the sweet principle derived from coal-tar by Dr. C. Fahlberg—are said to be palatable salts. Saccharin is chemically anhydro-ortho-sulphamine-benzoic acid. Its salt with quinine would be sulphamin-benzoate of quinine, or, for the sake of brevity, saccharinate of quinine (not saccharate, which is quite another thing). The sub-

stance is protected by patent. Saccharin itself has been proposed as a substitute for sugar in sweetening the food of diabetic patients.

Safrol is the stearoptene of oil of sassafras, and contains the real aromatic principle of the oil. It is colorless, boils at 449° Fahr., and congeals at a moderately cool temperature; sp. g. 1·108.

Salol, a newly derived antiseptic and antipyretic, is a phenyl ether of salicylic acid ($\text{HC}_6\text{H}_4\text{O}_2$). It seems to be superior to salicylic acid and its salts as a remedy for rheumatism, in its greater power of preventing endocarditis, and its freedom from secondary effects. It is a white, crystalline powder, of feeble aromatic odor (somewhat like wintergreen), and almost tasteless. Its rhombic crystals melt at 42° C. to a clear, colorless liquid. Its tastelessness is presumed to be owing to its insolubility in water; alcohol, benzol, and ether, however, dissolve it readily. It may be given up to two drachms daily without bad effects. It is supposed that salol undergoes no change in the stomach, but is acted upon by the pancreatic secretion and decomposed. It renders the urine blackish in color, owing to presence of oxidation products of phenol. Its use externally prevents the development of, but does not destroy, bacteria.

Santonate of Atropine is said by a German physician to be the best salt of atropine to use for ophthalmic purposes, owing to its freedom from liability to cause irritation or of its solutions to contain fungoid growths. It is a white, amorphous, non-hygroscopic powder, which forms dilute solutions with cold water; 0·01 grammie in 20 grammes of water is sufficient to dilate the pupil.

Scopoline, an alkaloid existing in *Scopolia Japonica*, dilates the pupil more rapidly than atropine, and its effects last longer. It does not appear to irritate the conjunctiva and it antagonizes the effects of eserine.

Tsuchiakabe is a recently noticed Japanese drug, consisting of the dried fruit of an orchid indigenous to Japan. It renders water acid and bitter, owing, it is presumed, to the presence of a resin-acid and a glucoside. The Japanese employ a watery extract in urinary diseases, in much the way that copaiba or cubeba are used elsewhere. It is said to be free from disagreeable odor.

DURAND, Asher Brown, an American line-engraver and painter, born in Jefferson village, (now South Orange), N. J., Aug. 21, 1796; died in South Orange, Sept. 17, 1886. He was descended from Huguenot ancestors. In the shop of his father, a watchmaker, he learned to cut ciphers upon spoons, and this employment, with his natural taste for drawing, turned his attention to engraving. His earliest experiments were upon plates hammered out of copper coins, with instruments invented by himself. His first work upon a proper plate was an engraving of a portrait painted upon the lid of a snuff-box. Although entirely without

instruction, he managed to produce a copy esteemed so successful that he decided to adopt engraving as his profession. In 1812 he was apprenticed to Peter Maverick, of New York, at that time a prominent engraver. During his apprenticeship he was chiefly employed in copying English book-engravings for publishers, but, becoming intimate with Samuel Waldo, he received instruction in portraiture and engraved a plate after a painting of a beggar by Waldo. This was exhibited, and proved the beginning of a successful career as a portrait-engraver. Durand's study of books at this time was for the most part confined to the illustrations, and the only academic art education that he received was derived from a brief attendance at the antique class of the old American Academy of Fine Arts, where his self-acquired skill in drawing is said to have

ASHER BROWN DURAND.

surpassed that of the director. In 1817 he entered into partnership with Maverick; but this partnership in the monotonous labor of copying English prints and working upon bank-note plates was soon ended by Trumbull's choice of Durand as the engraver of his painting, "The Declaration of Independence." Upon this engraving, made from the miniature portraits in the painter's small picture, Durand worked for three years, receiving \$3,000 in compensation on the publication of the engraving in 1820. This plate, which is still probably the best known of his engraved works, established his reputation as one of the leading American engravers of his time. For fifteen years he was an active and prosperous engraver. He engraved several heads for the "National Portrait Gallery." Baker mentions thirty-two portraits, among which are engravings after paintings of Washington, Monroe,

Madison, John Quincy Adams, Jackson, Jay, Kent, Marshall, De Witt Clinton, and Oliver Wolcott. Durand's portrait of Charles Carroll, after Harding, attracted the surprised attention of many artists and amateurs abroad. But his engraving of "Musidora," after his own design (1825), and his engraving after Vanderlyn's "Ariadne," remain with the "Declaration" the most important examples of his engraved work, much better known to connoisseurs than his portraits or landscapes. It was difficult to persuade foreign amateurs that the "Ariadne" was of American origin. This work, which has been called "the finest example of the nude yet produced in this country," and "equal to any specimen of contemporary European art," closed Durand's career as an engraver. It is not too much to say that he stood then, and until his death, at the head of this profession in America, although the first place in one special branch, landscape, has been generally conceded to the late James Smillie. In 1835, at the age of thirty-nine, Durand abandoned engraving for painting. His ambition for original work in a medium more flexible and forcible than the burin and steel plate, was encouraged by his friend Luman Reed, an early New York collector. Durand's first essays in the new medium were portraits of Kent, Jackson, Gouverneur Kemble, and later, a portrait of Bryant, which, like others, was engraved in part by the painter. From portraiture he turned to figure compositions, usually representing historical subjects, like "Harvey Birch and Washington," "The Capture of André," "The Dance on the Battery," and "The Wrath of Peter Stuyvesant," all popularized in engravings. These subjects, with their landscape backgrounds, brought him nearer the theme that was to engage his best energies as a painter. Several years before, American landscape-painting had begun with Cole, who was followed a few months later by Doughty. When the National Academy of Design was founded, in 1826, both these artists had gained some degree of recognition, and were, like Durand, among the first members. His career as a landscape-painter began later, but the three artists are associated as the first American landscape-painters. Durand's strong love of nature turned him toward landscape in preference to any other branch of art. His earlier landscapes, like the "Morning and Evening of Life" and "Kindred Spirits," had an allegorical significance that was probably due to the influence of Cole. In the latter picture Bryant and Cole were depicted standing upon rocky plateau in the Catskills, "in rapt survey of the glorious scene." Later, Durand gave himself up to the painting of landscapes, from pure love of nature, without any attempt at complex significance. In addition to numerous mountain and forest views in the Catskills and White Mountains, he painted many pastoral scenes. But his favorite subjects were found in the forests, and he will be best remem-

bered as a painter of trees. Durand is a conspicuous figure in the history of American art. He was an artist of remarkable capacity rather than versatility; for he was not only engraver, portrait-painter, and landscape-painter, but successful in each department. Moreover, he was practically self-educated. The advantages deemed essential now were wanting to him, as to most of his contemporaries. He learned engraving by practical experiments, and painting in much the same manner, borrowing hints from books and from other artists, but enjoying no systematic instruction. It was not until 1840 that he went abroad, and for the first time was able to study examples of great art. Like Cole, he was not influenced by the new departure in landscape led by Constable, nor by Turner, nor by the romantic movement headed by Delacroix and Gericault in France, which was followed by Rousseau and the modern French landscape school. Cole is said to have drawn his inspiration from Claude and Salvator Rosa. It is not worth while to trace a foreign influence in Durand's work, which was objective, like Düsseldorf art, and also like much later American painting. Durand's technique was most strongly influenced by his long use of the burin in careful imitation and patient detail. He had an advantage in accurate draughtsmanship, which enabled him to give the lines of a composition with truth; but there were the disadvantages of constraint and of needless attention to minutiae. It may be admitted, however, that few of our artists have drawn trees so intelligently and truly. It has been said that "his practice of studying character in portraiture gave him insight into the individuality of trees, he invested them with a humanity." Durand was hardly an imaginative painter; but to a large extent this personification of trees, if it may be so called, is characteristic of his paintings. His perfect sincerity and genuine love of nature are expressed in his work, and these qualities are entitled to a respect seldom accorded the earlier American painters, by some of their cleverer but less sincere successors. Durand's limitations were inevitable. Yet his earnestness enabled him to translate something of the sentiment of his subjects, and we must remember that his art was peculiarly national, probably the purest representative of the American art of his time. As with many of his contemporaries, his art was somewhat affected by a literary influence, although his love for Bryant and Wordsworth was never so plainly shown in his paintings as Cole's enthusiasm for Bunyan and Scott. Personally, Durand was a man of remarkable nobility, purity, and gentleness. He constantly maintained the dignity of art, as opposed to its degradation for commercial purposes; and the esteem in which he was held by his brother artists was indicated by the offices to which he was chosen in the National Academy. He was a member of the first exhibition committee, filled the office of secretary

for six years, was elected vice-president in 1844, and president in 1845, which office he held until his resignation in 1861. He was one of the first members of the Century Club, as well as of the Academy. Living at his birthplace in New Jersey, Durand continued his landscape-painting until he was over eighty-four years of age, contributing to the Academy irregularly until 1880. In this year he finished perhaps his last picture, a view of Lake George; but even later he found his greatest pleasure in occupying himself with palette and brush in his studio. His death removed the last of the painters that may be justly termed the pioneers in American art. Among Durand's landscapes are "The Forest Primeval"; "The Trysting-Tree," exhibited in 1869, and belonging to Benjamin H. Field; "The Clove, Catskill Mountains," belonging to the Century Club; "Franconia Notch," exhibited in 1874, owned by Mrs. R. L. Stuart; "In the Woods," owned by Jonathan Sturges, which was sent to the Paris Exposition of 1867; "Thanatopsis," owned by J. P. Morgan; "Landscape," owned by Morris K. Jessup; "The Catskills," dated 1859, and owned by W. T. Walters, of Baltimore; and "Berkshire Hills," in the Hurlbut collection at Cleveland. To the Centennial Exhibition at Philadelphia Mr. Durand sent "Studies from Nature," "Il Pappagallo," "Kaaterskill Clove," "A Brook Study," and a portrait of Gouverneur Kemble. In the official report he was spoken of as having "stimulated into activity a feeling for landscape" in American art, and as "extremely sensitive and refined in his rendering of landscape." He was formally commended by the judges for "excellence in engraving." Accounts of Durand's life and works may be found in the "History of the Arts of Design in the United States," by William Dunlap; "Book of the Artists," by H. T. Tuckerman; "American Engravers," by W. S. Baker; "American Painters," by G. W. Sheldon; "Art in America," by S. G. W. Benjamin; "Artists of the Nineteenth Century," by Clara Erskine Clement and Laurence Hutton; and "Cyclopædia of Painters and Paintings," by John D. Champlin, Jr.

DYNAGRAPH. (*Greek δύναμις, strength, and γράφη, a writing*). In its practical application the dynagraph is an instrument for automatically recording the condition of a railway-track. There is only one such instrument in existence—the invention of P. H. Dudley, C. E., and it has satisfactorily reported upon most of the principal railroad lines of the United States. The dynagraph is mounted in a private car fifty feet long, specially constructed for the purpose, with long six-wheel trucks. The after-half of the car is a work-room containing the dynagraph and the various tables, desks, and appliances requisite for supplementing its automatic record. The forward end is fitted for permanent quarters, and there Mr. and Mrs. Dudley have made their home, ever since the dynagraph was finished and put in

working order. This compact little domestic establishment is very interesting, aside from the scientific and mechanical importance of the adjoining workshop. In its exterior appearance as well as in its interior arrangements the car is in strong contrast to the gorgeous palaces on wheels of the great railway magnates. It is eminently utilitarian in all its details. Space is everywhere economized, and ingenious contrivances for saving time and grafting household duties upon the inexorable demands of the dynagraph are a study in themselves. Mrs. Dudley is a musician, and her piano is the most bulky article of furniture. It is, as it were, built into the car itself, having been taken out of its case and carried in before the partitions were put up. Underneath are chests of drawers and lockers, and overhead and on every side are appliances for the storage of clothing and household supplies. The kitchen and dining-room are in one compartment occupying the full width of the car, and fitted with a tiny cooking-range, while the necessary culinary utensils are packed with intelligent ingenuity where they can be easily reached, and are yet out of the way. Every-

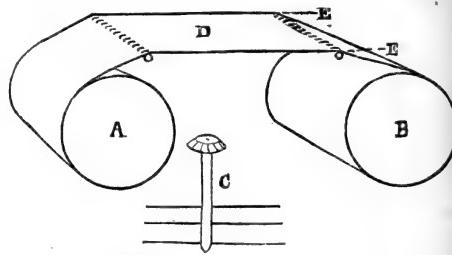

FIG. 1.—THE DYNAGRAPH.

thing is necessarily fitted so as to endure without damage the perpetual shocks and jars incident to this peculiar home. Mrs. Dudley acts as an efficient assistant to her husband when the dynagraph is on duty, and is nearly as familiar as he with its working details. Mr. Dudley is a photographer and a chemist as well as a mechanical engineer, and his office and work-room is, if anything, a greater marvel in its way than the domestic half of the establishment. It occupies the rear end of the car, so that the observer can watch the performance of the dynagraph, and, if necessary, glance through the rear windows at the track itself, if the automatic record indicates anything unusual. Fig. 1 shows the principle on which the dynagraph is constructed. Details are omitted because it is impossible to make them clear without reference to a working model. A and B are two drums, A carrying a roll of paper 1,350 feet long and 30 inches wide. The two drums are connected with the axle of a pair of truck-wheels by means of a vertical shaft, C, the connections being made in the usual way by cogged-wheels, caus-

ing the paper drums to revolve so that B receives the paper as fast as A delivers it. A tension-regulating apparatus causes the paper to pass smoothly and evenly across the space marked D, which is, in fact, the recording-table. Above this table is a series of pens, some delivering red ink, some black, and some blue. These in turn are connected with an elaborate system of mechanism leading to the rails over which the car passes. Small steel rollers bear upon the sides of the rails and upon their upper surfaces, and act so uniformly that the slightest deviation from the normal adjustment is recorded upon the moving sheet of paper in the car. A separate device is required to take the dynamometrical curve of the moving train. A draw-bar is mounted over the paper and connects by ingenious mechanical appliances with a fluid-chamber attached to the framework of the car. Any pressure against the draw-bar is communicated to the pen that traces the dynamometrical curve. It is impossible intelligibly to describe, even with the aid of diagrams, all the intricate yet simple mechanism that secures the results shown in Fig. 2, which represents a cross-section of paper after it has passed under the recording-pens. A list of the work done as the car passes along at the rate of twenty miles an hour will give a better idea of its practical utility than any attempt at detailed description: 1. Alignment of rails (approximate); 2, gauge of track; 3, degree of curvature and general alignment of the line; 4, deflections and irregularities of all kinds in the rails; 5, elevation of the outer rail in curves; 6, gradients; 7, oscillation of car-body; 8, exact distance run; 9, time-marks in seconds; 10, dynamometrical curves (the ordinates of the curves and the foot-pounds of work can be calculated from these data). In addition to these records there is an attachment that automatically discharges a small quantity of paint against the side of the rail wherever a fault occurs of sufficient importance to require attention. This enables the trackmen to see at a glance where their services are needed, so that they do not have to stop and examine every joint separately. An operation involving the wearisome task of stooping to inspect the rails on both sides wherever the joints show signs of wear.

When the dynagraph is in operation the paper, instead of being delivered directly upon the second drum, is carried over a long table fixed in the center of the car (see dotted lines E E, Fig. 1), so that the observer can have plenty of time to watch the record and make memoranda for future reference as the work progresses. Practice has cultivated the inventor's skill to such a degree that he can often tell the special

make of the rails over which the car is passing, and, standing beside the instrument he reads the story told by the different lines as readily as if they formed words and sentences. One inch of the paper may represent 50 feet, or 100 feet, or 200 feet of track, according to the necessities of the case. The 50-foot gauge is always used for track-inspection, and in that case 8' 8 feet of paper represent one mile of track.

The first dynagraph was made in 1874, and was used on the Valley Railroad of Ohio from 1875 till 1878, when the present machine was

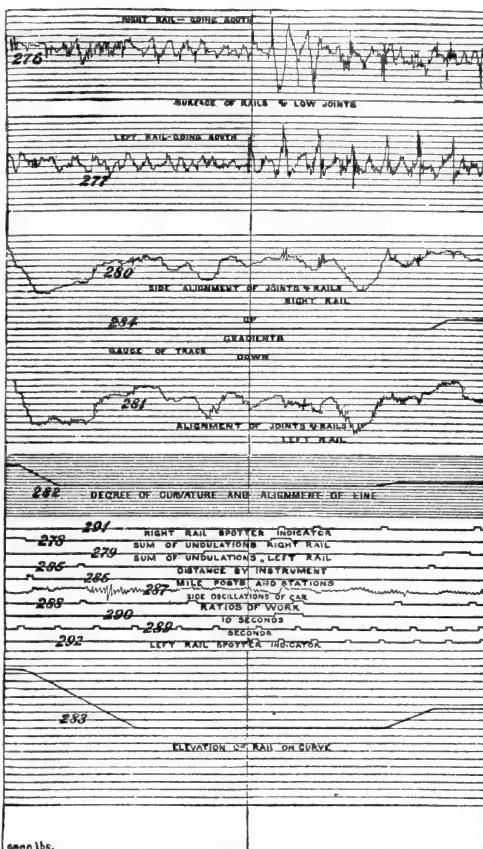

FIG. 2.

built. With the first instrument, which carried paper only 11 inches wide, many experiments were tried; and the value of the idea was fully demonstrated. A long series of observations was necessary, however, before the instrument approximated its present remarkable accuracy. The data furnished by the dynagraph have enabled the management of the roads using it to effect material saving in running expenses, and in wear and tear; for nothing consumes more mechanical energy than an uneven track.

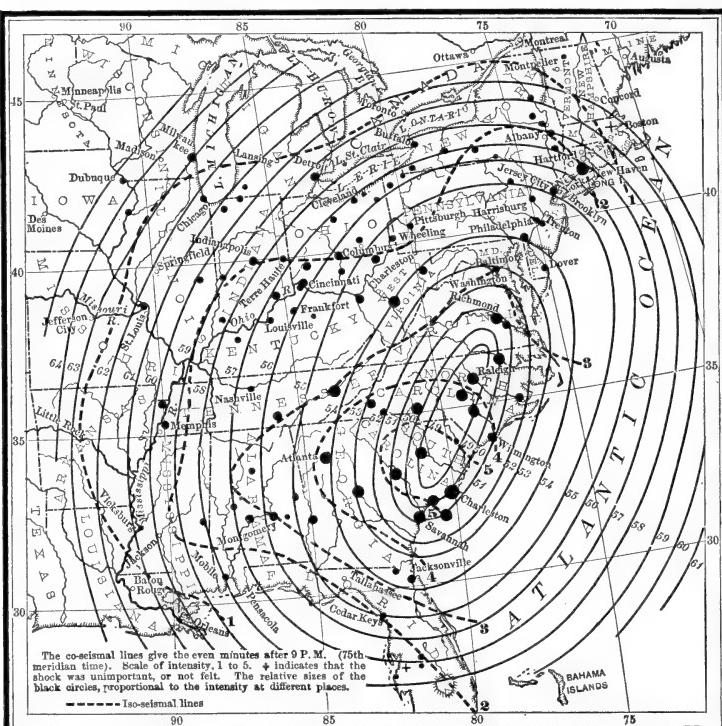

EARTHQUAKES IN THE UNITED STATES. The recent shocks of earthquake have directed attention to previous seismic disturbances, and more particularly to those that have shaken the territory of the United States. The Indians had traditions of prehistoric earthquakes; and the list, which begins soon after the landing of the Pilgrims is longer than is popularly supposed. Several shocks are recorded in the early histories and in the "Transactions" and "Memoirs" of the various scientific and philo-

man (1729), vol. xxxvi, p. 124. Prof. Williams brought the record to the close of the eighteenth century. The principal seismic disturbances are summarized in the following account:

The earthquake of June 1, 1638, O. S., was the first that occurred after the landing of the Pilgrims. It is said to have been preceded by a rumbling noise like remote thunder, growing continually louder and drawing nearer. Then the earth began to quake until the shock threw down the pewter from the shelves, toppled over stone walls, and shook off the tops of chimneys. In some places it was difficult for people to remain standing. The course was from northwest to southeast, and it was observed by the Indians beyond any of the English settlements. A second shock, not so strong, followed the first after an interval of half an hour. The duration of this earthquake is very uncertain. Winthrop says it occurred "between three and four in the afternoon."

In 1642, about seven o'clock of Sunday, March 5, another very perceptible trembling of the earth was noticed, but it did no damage.

On Oct. 29, 1653, a little earthquake gave the divines of that day a theme for ponderous sermons, and in 1658 the earth again trembled. Of this Prof. Williams says, "In all ancient histories this is mentioned as a great earthquake, but I can not find

MAP SHOWING EXTENT OF EARTHQUAKE SHOCKS.

sophical societies at home and abroad. The most complete account is that read before the Academy of Arts and Sciences in Boston, in 1783, by Prof. Samuel Williams, LL. D., of Cambridge, Mass. It is printed in vol. i, p. 262, of the "Memoirs" of that association. The curious reader may be referred also to the communications of Mr. Paul Dudley (1735) in vol. xxxix of "Transactions of the Royal Society," p. 63; of Rev. Mr. Plant (1742), vol. xlii, p. 33; of John Hyde, Cadwallader Colden, and Peter Collinson, Esqrs. (1756), vol. xlxi, pp. 439-444; of Prof. Winthrop, of Cambridge (1757), vol. i, p. 1; and of Mr. Benjamin Cole-

any account of the month, day, violence, cause, effects, extent, or any other particulars of it."

On Jan. 26, 1663, O. S., "at the shutting in of the evening," there was an earthquake, with shocks at intervals during three days, Jan. 26, 27, and 28. It was preceded by a great roaring noise, and the first shock came about seven o'clock in the evening. The houses rocked violently, dishes were thrown from the shelves, walls were cracked, and the tops of chimneys were broken off. Men, women, and children ran out into the streets and open places, and passengers staggered to and fro like men on the deck of a tossing vessel. In Canada the effect of this earthquake was severe indeed. An old narrative thus tells of its occurrence: "About half an hour after five in the evening, a most terrible earthquake began. The heavens being serene, there was suddenly heard a roar like the noise of a

great fire. Immediately the buildings were shaken with amazing violence. Doors opened and shut of themselves with a fearful clattering. The bells rang without their ropes being touched. Cracks appeared in the walls of buildings, and floors separated, and in some cases fell down. Chasms appeared in the fields, and the hills seemed to be in motion. The fright of the inhabitants was shared by the beasts and birds, who sent forth fearful cries, howlings, and bellowings. The duration of this earthquake was very uncommon. The first shock continued half an hour before it was over, but it began to abate about a quarter of an hour after it began. The same day, about eight o'clock in the evening, there came a second shock, equally violent as the first, and in the space of half an hour there were two others. The next day, about three hours from the morning, there was a violent shock, which lasted a long time, and the next night some counted thirty-two shocks, of which many were violent. Nor did the trembling of the earth cease until the July following. Many trees were torn up, and the outlines of the mountains appeared to be much changed. Many springs and small streams were dried up; in others the waters became sulphurous, and the channels in which some had run were so altered as to be unrecognizable. Halfway between Tadousac and Quebec two hills were thrown down, and formed a point of land, which extended half a quarter of a league into the St. Lawrence river. The island Aux Coudres became larger than it was before, and the channel of the St. Lawrence was greatly changed.

This earthquake extended to New York and Pennsylvania. There were slight earthquake-shocks in 1665, 1668, 1669, 1670, 1703, and 1720.

Sixty-four years after the earthquake that so frightened our ancestors and their Canadian neighbors, came another memorable shock. On Oct. 29, 1727, O. S., about 10.40 p. m., the air being clear and the sky serene, a heavy, rumbling noise was heard in the north or northwest. At first it seemed to be at a distance; but it increased until it was thought to be the roar of a blazing chimney near at hand, and at last was likened to the rattling of carriages driven fiercely over pavements. In about half a minute from the time the noise was first heard the earthquake was felt. It was observed by those who were abroad that as the shake passed under them the surface of the earth perceptibly rose and then sank; but, as it was late on Sunday night, there were probably not many travelers out-of-doors. The violence of the shock was such as to cause the houses to tremble and rock, as if about to fall to pieces. Doors, windows, and movable furniture made a fearful clatter. Loose articles, china, and pewter were pitched from the shelves; stone walls and the tops of chimneys were thrown down. There were various opinions as to the duration of this earthquake. The most probable is that the shake began about half a minute after the roar was first heard, and rose to the greatest violence in about a minute more. Its course, like that of the previous ones, seems to have been from northwest to southeast. It extended from the river Delaware, in Pennsylvania, to the Kennebec, in Maine, being perceptibly felt in both places, though the shock there was slight. It was also felt by vessels at sea. The place of greatest violence seems to have been at the town of Newbury, on Merrimac river. There the earth opened and cast up a quantity of sand and ashes mixed with sulphur. A correspondent of the Royal Society, in a communication relative to this earthquake, says, "A clergyman in a town about twenty miles from Boston assured me that immediately after the earthquake there was such a stink that the family could scarce bear to be in the house for a considerable time that night."

Concerning the earth that was thrown up, another clergyman, Rev. Mr. Lowell, writes: "About the middle of April (1728) the fine sand that was thrown up in several places in this parish at the first great shock, October 29, had a very offensive stench—nay, was more nauseous than a putrefying corpse; yet, in

a very little while after, it had no smell at all. How long it was before it began to have this stench I am not certain, but I believe it was covered with snow until a little while before."

Rev. Mr. Allin, then minister of Brookline, Mass., took notice of an uncommon change in the water of some wells. "About three days before the earthquake," he says, "there was perceived an ill-stinking smell in the water of several wells. Some searched their wells, but found nothing that might thus affect them. The scent was so strong and offensive that for eight or ten days they entirely omitted using it. In the deepest of these wells, which was about thirty-six feet, the water was turned to a brimstone-color, but had nothing of the smell, and was thick like puddle-water." Some wells also dried up just before the earthquake, but filled after the shock had passed. Several shocks were felt in the northern part of New England for some months after October 29, but they were generally incon siderable.

On Sept. 5, 1732, at about 11 A. M., there was an earthquake-shock which, though comparatively slight, was of considerable extent. It was strongest in Canada, but was felt in the New England colonies, and from Maryland to Maine.

On Feb. 6, 1737, at 4.30 in the afternoon, and on December 7 of the same year, a little before 11 o'clock at night, slight shocks were felt, but did no damage.

June 3, 1744, was a fair and hot day. At a few minutes after 10 A. M., a very loud noise was heard, followed by a trembling of the earth, which shook down bricks from the tops of chimneys, and ruined many stone walls.

The most violent shock of earthquake that was ever known in New England was in the year 1755. It came November 18, at eleven minutes and thirty-five seconds after four o'clock in the morning of a calm, clear night. The beginning of this earthquake was determined with all the exactness that could be required, by a curious accident. Prof. Winthrop, of Cambridge, having, some time before, used an unusually long glass tube in a particular experiment, shut it up in the case of his tall clock for greater security against breakage. This tube, standing nearly perpendicular, was upset by the first motion of the shock, and, falling against the pendulum, instantly stopped the clock at the time mentioned. The clock had been adjusted by a meridian line the preceding noon. Prof. Winthrop was awoken by the earthquake, but his bed was tossing so alarmingly, and the floor of his room shaking so violently, that he did not deem it prudent to walk to the fireplace until the shock was abating. Having then struck a light, he looked at his watch, which had agreed with the clock when he had retired, and found it to be fifteen minutes after four. The jarring was perceptible for about a minute after this, so that the total duration of the earthquake was nearly four and a half minutes. The shock was preceded by that peculiar rumbling noise or roar which frequently is the precursor of an earthquake. In about half a minute afterward the surface of the earth seemed to be suddenly raised, and, in subsiding, was thrown into a rapid, jarring, vibratory motion, which acted in a horizontal direction. This motion continued for about a quarter of a minute, and then abated for three or four seconds. Then all at once came a "violent, prodigious shock, as suddenly, to all appearance, as a thunder-clap breaking upon a house, and attended by a great noise." This severe and sudden shock was immediately succeeded by quick and violent concussions, jerks, and wrenches, attended by an undulatory, waving motion of the whole surface of the ground, not unlike the shaking and quaking of a large bog. For nearly half a minute it gradually declined, and then there was a perceptible revival of it, though of short continuance, and so, by degrees, all became quiet again.

The effect of these throes of Mother Earth upon the people of Boston is vividly told by several writers. Upon the first shock many persons jumped out of

their beds and ran into the streets; some lay between the sheets, afraid to rise; others sprang to the windows, and seeing in the dim light, that was almost darkness, their friends and neighbors naked, shrieked aloud with the apprehension that the day of judgment had arrived. Others yet thought they heard, among the varied noises, the trumpet of Gabriel sounding, and fell upon their knees and cried out for mercy; some fainted away for fright, and those of the most composed temper expected to be buried beneath the ruins of their houses. Children, waked from their sleep, ran crying to their frightened parents; the dogs howled dismaly; birds flew into the air with frightened cries, and cattle that were in the fields fled belowing to the barns and sheds. In Boston about 100 chimneys were leveled to the roofs of the houses, in some cases breaking through the roof-beams. About 1,500 were shattered and thrown down in part. Some were broken off several feet below the top, and some, by the suddenness and violence of the shock, were canted an inch or more from the perpendicular. Still others were twisted awry, as if by a circular motion. Many clocks were stopped. The vane on the public market-house was thrown down—the wooden spindle that supported it being broken off at a place where it was five inches in diameter; yet it had withstood the most violent gusts of wind. A new vane on one of the churches was bent at the spindle, and a distiller's cistern, made of plank, almost new and very strongly put together, was burst in pieces by the agitation of the liquor in it. Similar results were observable in the country. At Springfield a metal spindle on one of the churches was bent to a right angle. Through the whole province of Massachusetts, stone fences, cellar-walls, chimneys, and the like were cracked and thrown down. Great alterations were observed in the springs and ponds. In some the quality of the water was changed; in others, the quantity. New springs were opened, and old ones dried up. At Pembroke, Scituate, and Lancaster chasms were made in the earth (at Pembroke there were four or five of them), from which water issued and fine, white sand, or powdered ashes, were vomited. Almost immediately after the earthquake numbers of fish came to the surface of the ocean, dead or dying. One fishing-vessel brought in several quintals of these fish. This earthquake was traced a great distance. On the southwest it reached as far as Chesapeake Bay, being, however, felt on the easterly and not on the westerly side. At the northeast it was felt as far as Halifax. It was perceived at Lake George, but at Oswego, in New York, it was not felt at all. On the ocean the shock was so great that the mariners on board of a vessel seventy leagues from Cape Ann thought they had run aground or struck a rock, until, on sounding, they found they were in more than fifty fathoms of water.

Nine hours after the great shock was felt in New England an extraordinary motion of the sea happened in the harbor of St. Martin's, in the West Indies. The sea withdrew, leaving places where there was commonly at least five feet of water dry; and then, returning, it rose six feet above the ordinary level.

On November 22, at 7.27 at night, and on December 19 at 10 p. m., in the same year (1755), there were two light shocks.

Another shock, that was generally felt, came on the 8th of July, 1757, at 2.20 p. m.

In 1761, March 12, at about 2.30 a. m., an earthquake-shock was distinctly felt in New England; and there was a second one about 8 p. m. on November 1 of the same year.

In 1766, 1769, and 1771 there were slight tremblings of the earth.

At about 11 o'clock on Nov. 29, 1783, a small earthquake shook New England and the Middle States. At Boston, at Hartford, and at New Haven but one shock was felt, but there were three in New York, and at Philadelphia there were two, the first of which was the stronger.

In Silliman's "Journal of Science" a few of the

earthquakes felt in the region of East Haddam are mentioned. Two shocks, which followed each other in quick succession on May 16, 1791, seem to have been quite severe. The first was the most forcible, and walls and chimneys were broken and cracked, doors were unlatched, and a fissure several rods in extent opened in the ground. Thirty lighter shocks followed, and about one hundred were felt during the night and the next day.

On Aug. 28, 1792, at 10 p. m., and on October 24 in the same year, at 1 a. m., shocks were perceived; so, also, on January 11, and July 6, 1793, and on March 9, 1794.

There were slight shocks on May 8, 1804, and on August 11 and December 30, in 1805, but they excited little comment.

A slight trembling was felt on Nov. 9, 1810.

Prof. Williams was succeeded, as the historiographer of American earthquakes, by the Hon. Samuel L. Mitchill, who, in 1814, compiled an exhaustive account of the earthquakes of 1811, 1812, and 1813. (See "Transactions of the Literary and Philosophical Society of New York," vol. i, p. 281.) The year 1811 was noted for its beautiful comet, for the furious tempest that swept the entire Atlantic coast, and for its tremendous earthquake. On Monday morning, Dec. 16, 1811, was felt the most general seismic disturbance ever known on this continent. Mr. Mitchill gives accounts of the shocks at Washington, D. C.; Richmond and Norfolk, Va.; Raleigh, N. C.; Georgetown, Columbia, Charleston, and Pineville, S. C.; Savannah, Ga.; Natchez, Miss.; Knoxville, Tenn.; Louisville, Ky.; Jeffersonville, Ind.; Detroit, Mich.; St. Louis, Mo.; and New Orleans, La.; and from Philadelphia, Baltimore, New York, and many other places. This earthquake was remarkable for its violence, its extent, and its continuance. The Mississippi and Ohio valleys were visited by shocks at frequent intervals during 1812 and 1813. Dr. Robertson, who, by order of the Government, in 1806, traveled to the sources of Arkansas river, witnessed these shocks at St. Genevieve, Mo., and kept a memorandum of their number until five hundred had been recorded, when he grew weary of the task and ceased to note any more. The Indians said the shocks were very frequent and violent far westward beyond civilization. The center of disturbance was apparently near New Madrid, Mo. The following account, dated Dec. 25, 1811, was written by William Leigh Pierce, and is mentioned by Mr. Mitchill as worthy of credence. In considering the phenomena that it details, the reader should remember the condition of civilization in the region affected. There were few structures of brick or stone, the dwellings were almost invariably constructed of logs, and even in New Orleans the buildings were mostly small and insignificant. Mr. Pierce was going in a flat-boat from Pittsburg to New Orleans. He left the Ohio and entered the Mississippi on Friday, Dec. 13, 1811, and on the evening of the 15th (Sunday night) tied up at the left bank, about 116 miles from the mouth of the Ohio. His

boat was one of a considerable fleet. The night was extremely dark and cloudy; not a star appeared in the heavens, and there was every indication of a severe rain. "Precisely at two o'clock on Monday morning," says Mr. Pierce, "we were all alarmed by the violent and convulsive agitation of the boats, accompanied by a noise similar to that which would have been produced by running over a sand-bar. Every man was immediately aroused, and rushed upon deck. The first shock was followed by a second, and then by two others in immediate succession, accompanied by continuous and tremendous explosions resembling a discharge of artillery. These continued for eight minutes. So complete and general had been the convulsions that a tremulous motion was communicated to the very leaves on the surface of the earth. A few yards from the spot where we lay, the body of a large oak was snapped in two, and the falling part precipitated to the margin of the river; the trees of the forest shook like rushes; the alarming clattering of their branches may be compared to the effect that would be produced by a severe wind passing through a large cane-brake. At dawn of day I went on shore to examine the effects of the shocks; the earth about twenty feet from the water's edge was deeply cracked, but no great injury was visible; fearing, however, to remain longer where we were, we thought it advisable to leave our landing as expeditiously as possible. This was immediately done. At a few rods from the shore we experienced a fifth shock of such strength that the bank to which we had been attached was rent and fell into the river; while the trees rushed from the forests and precipitated themselves into the water with force sufficient to have dashed us into a thousand atoms. Wherever the veins of the earthquake ran there was a volcanic discharge of combustible matter to great heights, an incessant rumbling was heard below, and the bed of the river was excessively agitated, while the water assumed a turbid and boiling appearance. Near our boat a spout of confined air, breaking its way through the waters, burst forth, and with a loud report discharged mud, sticks, etc., from the river's bed at least thirty feet above the surface. These sputtings were frequent, and in many places appeared to reach to the very heavens. Large trees, which had lain for ages at the bottom of the river, were shot up in thousands of instances, some with their roots uppermost and their tops planted; others were hurled into the air; many again were only loosened, and floated upon the surface. Never was a scene more replete with terrific threatenings of death. The earth and river, torn with furious convulsions, opened in huge trenches, whose deep jaws were instantaneously closed. Through a thousand vents, sulphureous streams gushed forth, leaving vast and unfathomable caverns. During the day there was, with very little intermission, a continued series of shocks, attended with innumerable explosions, like the rolling of thun-

der. Banks, with all their growth, fell into the river, whose bed was incessantly disturbed. The oldest trees of the forest quivered with the violence of the shocks, while their heads were whipped together with a quick and rapid motion. Several small islands have already been annihilated, and from appearances many others must suffer the same fate. To one of these I ventured in a skiff, but it was impossible to examine it, for the ground sank from my tread, and the least force applied to any part of it seemed to shake the whole. Anxious to obtain a landing, and dreading the high banks, we made fast to some willows on a sunken piece of land at the extremity of an island, and continued there for two days, hoping that the scene of horrors would be over; still, however, the shocks continued, though not with like frequency as before. On Wednesday afternoon I visited every part of the island where we lay. It was extensive and partially covered with willow. The earthquake had rent the ground in large and numerous gaps; vast quantities of coal and charred wood were spread over the ground. I saw several places where those spouts which had so much attracted our wonder had arisen; they were generally on the beach, and had left large circular holes in the sand, formed much like a funnel. For a great distance around the orifice vast quantities of coal had been scattered. Many pieces weighing from 15 to 20 pounds were discharged 160 measured paces. One of these holes was 16 feet in perpendicular depth and 63 feet in diameter at the mouth. On Thursday morning we loosened our cables. As we descended the river, we saw subterranean forests, which raised their heads, hard and black as ebony, above the surface of the water. We passed also thousands of acres of land which had been cleft from the main shore and tumbled into the water, leaving the tops of the trees waving above the surface. At Fort Pickering, 242 miles from the mouth of the Ohio, the land is strong and high. Here, however, the earth was extremely agitated, and the block-house, which was almost a solid mass of hewed timber trembled like an aspen-leaf. Many poor fellows were undoubtedly wrecked or buried under the banks; and many boats were lost."

Mr. Pierce was not the only one that was alarmed. At Charleston, S. C., a severe shock was felt a few minutes before 3 A. M. A noise like distant thunder was heard at intervals. St. Philip's steeple vibrated so that the clock-bell rang for ten seconds. Clocks were stopped; houses were shaken, and articles suspended from the ceilings and walls swung to and fro. People were awakened, and left their beds in terror.

Earthquake-shocks continued to be felt during the year 1812 throughout the valleys of the Mississippi and its tributaries. Audubon, the naturalist, has left in his "Ornithological Biography" an account of shocks that

he felt in November, 1812, and shortly after that date. It is interesting to speculate what would have been the result had there been, in the regions most affected by these earthquakes, houses of stone or brick. The log-houses were well calculated to withstand injury, and it may be said that the principal relic of the earthquake exists to-day in that vast tract of country south of New Madrid, known as "The sunk country."

No special record was kept of the earthquakes that followed the disturbances of 1811-'12 until Mr. Rockwood, in 1872, published his notes in the "American Journal of Science and Arts." A list of the earthquake-shocks in the interim has, however, been collected from the newspapers.

On Feb. 15, 1815, two smart shocks were felt at Weston, Mass. Many of the inhabitants were greatly alarmed, for the shocks came at night, and the next day fissures or cracks were discovered in the earth, extending to a great distance and branching in various directions.

On Sept. 14, 1816, two considerable shocks were felt at New Madrid, Mo. On Nov. 9 of the same year two shocks were experienced at Pittsfield, Mass. Smart shocks were felt in all the towns in the upper part of South Carolina and Georgia about 11 p. m., Dec. 10, 1817. Shocks were felt in Alabama on Aug. 22, 1824; in the Mississippi Valley, May 7, 1836, Jan. 30, 1840, and June 2, 1840; in Connecticut, Aug. 9, 1840; in New Jersey, Aug. 12, 1843; in Washington and Baltimore, Feb. 8, 1843; in South Carolina and the valleys of the Mississippi and Ohio, Jan. 4, 1843; in Massachusetts, Nov. 24, 1843; in the Mississippi valley, Aug. 18, 1843; in New Jersey, Jan. 28, 1844; in New York, Oct. 22, 1844; in Tennessee, Dec. 25, 1845; in New York, Oct. 26, 1845, and Feb. 4, 1846; in New England, Aug. 25, 1846, and June 8, 1847; and in New York and New England, Sept. 8, 1848. None of these were so violent as to do serious damage; but the list shows that the crust of the earth has seldom been quiet for any considerable length of time.

The Pacific coast, ever since its settlement, has been subject to violent seismic disturbances. Three recent earthquakes—in 1865, 1868, and 1872—were specially destructive of property and life.

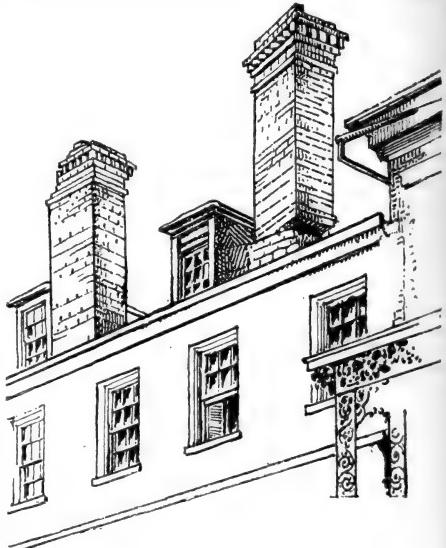

The Charleston Earthquake.—On the night of Aug. 31, 1886, an earthquake-shock was felt over a wide extent of country, was especially severe in South Carolina, and wrought such havoc in the city of Charleston that it is known as the Charleston earthquake. The following are the times (in hours, minutes, and seconds) at which it was felt in various localities: Charleston, S. C., 9.51; Washington, D. C., 9.53.30; Baltimore, Md., 9.54; New York, 9.54; New Haven, Conn., 9.55.30; Toronto, Can., 9.55; Newport, Ky., 9.54.15; Portsmouth, Ohio, 9.55.57; Dubuque, Iowa, 9.58; Jacksonville, Fla., 9.54. It is impossible

to give an exact account of the damage done by this earthquake in Charleston. It has been estimated that the loss in buildings that were shaken down or rendered unsafe will amount

RUINED GABLE, IN CHARLESTON.

to more than \$5,000,000. Appeals for aid were made, and every large city responded. Many persons were killed by objects thrown down by the shock; but many more died from the exposure that followed, for the people

CHIMNEY DISPLACED BY TORSION, IN CHARLESTON.

were so frightened, and in many instances the buildings were so unsafe, that the inhabitants camped out in the public parks and other open spaces for several days. The alarm was perpetuated by the continuance of the shocks,

which have been felt at frequent intervals up to the time of the writing of this article. The city of Charleston seems to have been near the center of disturbance, although the greater portion of South Carolina was severely shaken. The accompanying illustrations will serve as specimens of the damage done.

It is only of recent years that any pretense has been made of keeping a correct record of every shock, and it is, therefore, almost impossible to say whether earthquakes are increasing in frequency. The table is believed to be the most complete yet published.

Causes.—Seismology, the science of earth-

HOUSE IN LINCOLNVILLE, S. C. CHIMNEY-BASE CRUSHED BY UPWARD MOVEMENT OF THE EARTH.

On Aug. 10, 1884, a strong earthquake occurred in New England and the Middle States. The center of intensity seems to have been at Jamaica and Amityville, on Long Island. At Jamaica the walls of the Presbyterian Sunday-school were cracked in two places, the openings being from one to two inches in width and extending from roof to foundation. In a house at Amityville a large mirror, reaching from the ceiling to the floor, was cracked from top to bottom, and the walls of the room were cracked in two places; a broom-handle could be laid in the cracks in the wall.

The following table has been compiled from the records of Prof. Rockwell, as reported in the "American Journal of Science and Arts":

quakes, is still in its infancy. Mr. Mitchell says: "When engaged in the task of collecting these curious and interesting phenomena, I was in expectation that physical occurrences, so immediately before our eyes and under our feet, would have qualified me to form something like a tolerable theory of earthquakes. I must own, however, that, after all the information I have collected, I have not been enabled to offer a solution by any means satisfactory to myself." Several hypotheses have been invented to explain the phenomena of earthquakes, and the advocates of each find arguments to support those they favor, in the various conditions of earth, air, water, and the celestial bodies at the time of the seismic disturbance. It has been attempted by some scientists to draw distinctions between earthquakes, earth-oscillations, earth-tremors, and earth-pulsations. Briefly stated, the theories may be said to be six:

1. The theological theory, held by an immense number of people, who believe that the earthquake is due to the direct intervention of God, as a punishment for sin or a warning to righteousness. This theory is of the greatest antiquity.

2. The mechanical theory, which imputes the earthquake to the slipping of rock strata, and lays especial stress upon the earth's falling

1884.....	9	5	7	21
1885.....	5	9	3	34

in some places, rising in others, and being agitated everywhere.

3. The volcanic theory, which holds that the disturbances are due to fires in the earth's center, and to their fumes and steam, which force an outlet. In the hot water, steam, and gas ejected, and in the odors imparted to springs and wells, they find evidence of the truth of their theories.

4. The astronomical theory, which holds that the cause is to be found in the attraction of the planets, derives argument from the enormous weight of extraordinary tides, and claims that the attraction of the sun and the moon operates on the crust of the earth as it does on the great body of water that it raises or lowers. Much discredit has been cast upon this theory by charlatans who have pretended to foretell earthquakes from the stars.

5. The electrical theory, whose followers will deduce from the lights, noises, and velocities of their motions, and from comets and meteors that have appeared simultaneously with the earthquake, conclusions favorable to the origin of the disturbance from that subtle and universal agent, electricity. Thus, for example, an earthquake occurred in Connecticut on Aug. 9, 1840, and at the same time occurred an unusual fall of meteors, numbered by a writer in the "American Journal of Science and Arts" as high as 1,500, for the night of the 9th. It is curious to observe that on Feb. 2, 1766, in Rhode Island and Massachusetts, and in November of the same year at Charleston, S. C., and at Weston, Conn., in December, 1807, a similar coincidence was remarked.

6. The chemical theory, which ascribes the disturbance to fermenting or decomposing minerals. A curious instance of decomposition of crystalline rocks is reported by Dr. Hunt. They were principally gneisses with hornblendic and micaceous schists, and are completely decomposed to a depth of fifty feet or more from the surface, being changed into an unctuous, reddish brick-clay, in the midst of which the interbedded layers of quartz are seen retaining their original positions. The believer in the conversion of metallic potassium, by rapid inflammation, into common potash in the deep recesses of the earth, finds in the saltpetrous sandstone an argument for his belief in the chemical theory of earthquakes.

Observations.—It is much to be regretted that phenomena accompanying seismic disturbances have been hitherto so imperfectly noted. The manner in which these workings of Nature reveal themselves to us have such a powerful influence upon the imagination and understanding that few people are sufficiently calm and collected to report fully the attendant circumstances. The lack of any definite bureau to which information could be forwarded by individual observers was also a powerful factor in maintaining the state of ignorance on this subject, and to obviate this want the Director

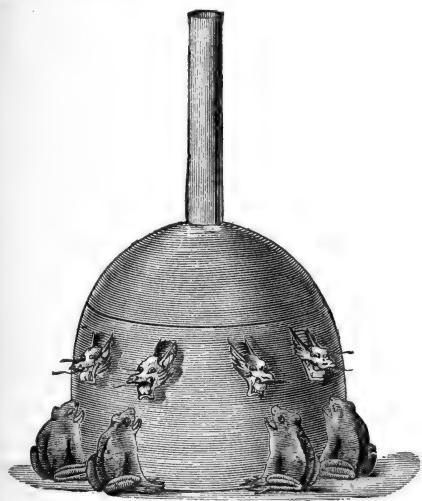

of the Geological Survey called a meeting at Washington on Nov. 21, 1884, to consider and arrange a systematic plan of earthquake-observation throughout the country. It was decided to attempt work in two directions: First, by the distribution of circulars, which were to be filled up by individual observers and returned to the Geological Survey after the occurrence of an earthquake; and, secondly, the establishment of stations, provided with instruments for recording the earth's motion. The address, to which inquiries and facts of interest can be sent, is Division of Volcanic Geology, U. S. Geological Survey, Washington, D. C.

An attempt has been made to distinguish, by the use of adjectives, the relative degrees of intensity of shocks, and the following table has been prepared for the use of observers:

1. *Very light.*—Noticed by a few persons, but not generally felt. 2. *Light.*—Felt by a majority of persons, rattling windows and crockery. 3. *Moderate.*—Sufficient to set suspended objects, as chandeliers etc., swinging, or to overthrow light objects favorably placed. 4. *Strong.*—Sufficient to crack the plaster in houses, or to throw down bricks from chimneys. 5. *Severe.*—Overthrowing chimneys or walls and injuring some buildings. 6. *Destructive.*—Causing general destruction of buildings, etc. It is hoped that future observers will use this scale in their reports to the Geological Survey. The following suggestions are made by the Geological Survey to observers: "State the observer's situation—whether in the house or out-of-doors, up stairs or down, sitting, standing, walking, reading. Then answer the following questions, referring to them by number only: 1. Was an earthquake felt at your place? 2. At what hour, minute, and second, and whether railway or local time? 3. How long did you perceive it? 4. Was it accompanied by any unusual noise? If so, describe it. 5. Give, as accurately as possible, the number, duration, and character, of each shock. 6. Specify it according to the table of intensity—*light* or *very light*, etc. 7. Do you know of any cause for what happened, other than an earthquake? Give any further particulars of interest, stating whether they are from observation or hearsay. Mention the condition of the atmosphere; any strange effects on animals; character of damage to buildings; general direction in which walls, chimneys, etc., fell. Springs, rivers, and wells, are often noticeably affected, even by slight shocks. Describe the direction in which chandeliers, etc., swung. If pictures swung, state the direction of the wall, and whether pictures on the wall at right angles to it were also moved. If doors were opened or shut, state the direction of the wall in which they were set."

Seismometers, or instruments for recording earthquake-shocks have been frequently invented and used. Briefly stated, the governing principle of them all is either a pendulum,

which will swing according to the intensity and direction of the shock, or a ball balanced

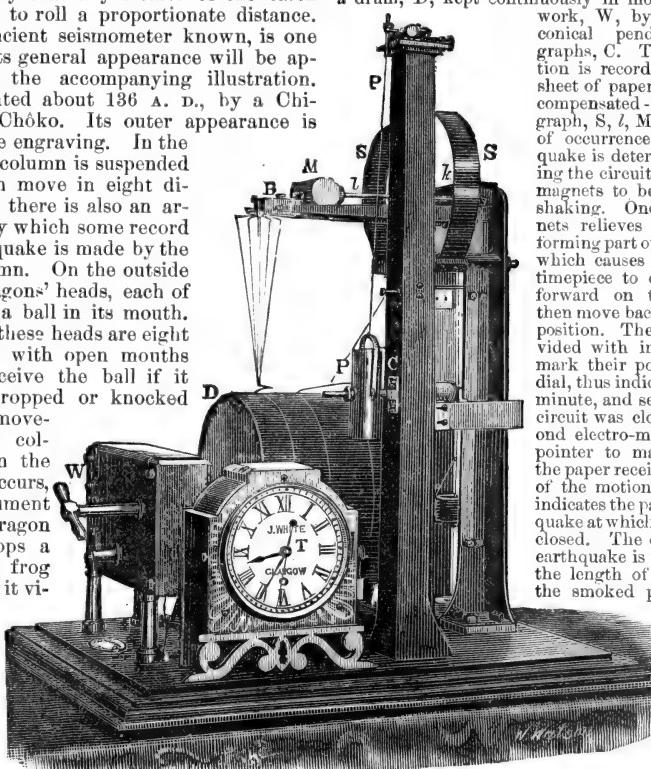

CHINESE SEISMOMETER.

in such a way that any tremor of the earth will cause it to roll a proportionate distance. The most ancient seismometer known, is one in China. Its general appearance will be apparent from the accompanying illustration. It was invented about 136 A. D., by a Chinese called Chóko. Its outer appearance is shown by the engraving. In the inner part a column is suspended so that it can move in eight directions, and there is also an arrangement by which some record of the earthquake is made by the moving column. On the outside are eight dragons' heads, each of which holds a ball in its mouth. Underneath these heads are eight frogs, placed with open mouths ready to receive the ball if it should be dropped or knocked out by the movement of the column. When the earthquake occurs, and the instrument is shaken, a dragon instantly drops a ball, and the frog that receives it vibrates vigorously. Although one dragon may drop a ball, it is not necessary for the other seven drag-

ons to drop their balls, unless the movement has been in all directions. Thus the direction of the earthquake is shown. The diameter of this instrument is eight feet. Not only is this instrument of interest because of its antiquity, but also because on account of the close resemblance that many modern instruments bear to it. Another instrument, also of Eastern origin, is the magnetic seismoscope of Japan. On the night of the destructive earthquake of 1855, which devastated a great portion of Tokio, the owner of a spectacle-shop in Asakusa observed that a magnet dropped some old iron nails and keys, which had been attached to it. From this occurrence the owner thought the magnet had, in consequence of its age, lost its powers. About two hours afterward, however, the great earthquake took place, after which the magnet was observed to have regained its power. The latest and most complete apparatus is the seismograph, invented by Messrs. Gray and Milne; it records the horizontal motion, the vertical motion, and the time. Mr. Milne thus describes it:

In this apparatus two mutually rectangular components of the horizontal motion of the earth are recorded on a sheet of smoked paper wound round a drum, D, kept continuously in motion by clock-work, W, by means of two conical pendulum-seismographs, C. The vertical motion is recorded on the same sheet of paper by means of a compensated-spring seismograph, S, I, M, B. The time of occurrence of an earthquake is determined by causing the circuit of two electro-magnets to be closed by the shaking. One of these magnets relieves a mechanism, forming part of a time-keeper, which causes the dial of the timepiece to come suddenly forward on the hands and then move back to its original position. The hands are provided with ink-pads, which mark their positions on the dial, thus indicating the hour, minute, and second when the circuit was closed. The second electro-magnet causes a pointer to make a mark on the paper receiving the record of the motion. This mark indicates the part of the earthquake at which the circuit was closed. The duration of the earthquake is estimated from the length of the record on the smoked paper and the rate of motion of the drum. The nature and period of the different movements are obtained from the curves drawn on the paper. Mr. Gray has

GRAY AND MILNE'S SEISMOGRAPH.

since greatly modified this apparatus, notably by the introduction of a band of paper sufficiently long to take a record for twenty-four hours without repetition. The record is written in ink by means of fine siphons. In this way the instrument, which is extremely sensitive to change of level, can be made to show not only earthquakes, but the pulsations of long period which have recently occupied so much attention.

ECUADOR., an independent state in South America. (For details relating to area, population, and territorial division, see "Annual Cyclopædia" for 1885.)

Government.—The President of the Republic is Don José María Plácido Caamaño, whose term of office will expire on May 16, 1889. The Vice-President is Don Pedro José Cevallos. The Cabinet was composed as follows: Interior, Foreign Affairs, Public Instruction, and Charity, Señor J. Modesto Espinosa; Finance and Public Works, Señor V. L. Salazar; War and Navy, Gen. J. M. Sarasti. The Minister of Ecuador at Washington is Dr. Don Antonio Flores. The Consul-General of Ecuador at New York is Señor Francisco Spier. The American Consul-General at Quito is Owen McGarr, and the Consul at Guayquil H. Beach.

Army and Navy.—The strength of the regular army in 1886 was 5,000 men. The navy consists of several sea-going and river steamers.

Finances.—The indebtedness of the republic, on Dec. 31, 1885, was composed of the foreign debt, \$11,400,000; the home debt, \$3,879,-181; and \$1,224,825 interest due on that date; the aggregate national indebtedness was consequently \$16,504,006.

The income of the nation during the fiscal year 1885 consisted of a balance in the treasury of \$191,543, income from revenues and contributions, \$2,524,175; and money obtained from temporary loans, \$1,327,486, aggregating \$4,043,204. The outlay was as follows: Salaries and commissions, \$801,379; public instruction, etc., \$235,781; postal service, \$82,402; army and navy, \$1,052,360; public works, \$39,144; railroads and telegraphs, \$59,201; Chones high-road, \$10,012; advances to banks of Ecuador, Quito, and La Union, \$1,264,909; indemnities and interest, \$156,949; payments for building wharf and to hospitals, \$151,992; expense of forwarding specie, \$75,805; constituting a total of \$3,929,-934. After deducting the expenditure from the revenue, etc., there remained a surplus of \$113,270. In 1884 the income from revenue and contributions had been \$2,531,219, or \$7,044 more than in 1885; but, as in 1885 loans had to be made to pay current expenses to the amount of \$1,327,485, and salaries and pensions remained unpaid to the amount of \$420,-472, there resulted for the year in reality a deficiency of \$1,747,957.

In his report to Congress, dated June 10, 1886, the Minister of Finance dwells at length on the returns from the six custom-houses. In 1884 the joint revenue derived therefrom was

\$1,728,320; in 1885 it did not exceed \$1,154,-539, showing a decrease of \$573,781.

During years when the country was politically undisturbed, the returns had been as follows: 1877, \$994,630; 1878, \$909,995; 1879, \$956,958; 1880, \$962,929; and 1881, \$1,532,853. The crops of quinine-bark, India-rubber, vegetable ivory, cocoa, and coffee were ample, and sold abroad at high prices; yet in spite of the favorable circumstances then prevailing, remarks Señor Salazar, and notwithstanding the fact that the war on the Pacific caused capital and merchandise to flow from Peru to our ports, there have not been made as large returns during those prosperous years as there were during the disturbed one of 1885, with the sole exception of 1881. This seems to indicate two things: that the custom-house officers are more honest than they were then, and that smuggling has abated notably. The duty collected on products exported in 1885 was in the aggregate \$107,832 on \$4,-353,959 worth of goods.

Attempt at Revolution.—President Caamaño was attacked on Feb. 6 at Yaguache, and one of his aides was killed. Señor Caamaño, without being wounded by his assailants, escaped to Guayaquil. On his arrival there a disturbance occurred with some of his political opponents, and cries of "Viva Alfaro!" were freely uttered. During the *mélée*, the chief of police and three others were killed, and several persons wounded. About the middle of April the revolutionists sustained a great defeat at Quevedo, after which the last vestiges of the rebellion instigated by Eloy Alfaro disappeared. The provinces where Alfaro's partisans had chiefly fomented disturbance were those bordering on the Pacific, northwest of Guayaquil river.

The Galápagos.—In December, 1885, the Ecuadorian Government sent a colonizing expedition to the Galápagos archipelago, under command of a territorial official, and furnished with the republic's coat-of-arms, and a flag to be hoisted by way of asserting sovereignty over that group of islands. Since then a lighthouse has been in course of erection at Chatham island.

Foreigners.—In consequence of the Santos case and the complications it involved in 1885, the Ecuadorian Congress passed in September, 1886, a Government bill to the following effect: Foreigners who participate actively in political dissensions within the limits of the republic are liable to expulsion, while being held responsible for infractions of the laws of the republic, and their rights and duties shall be regulated, while the state of war lasts, by international law and treaties. During the existence of a foreign war or civil disturbance, they are to remain subject to the laws of public order, as though they were native-born, except so far as treaties may have provided otherwise; and they remain furthermore, with this proviso, subject to such extraordi-

nary power as has been delegated to the executive by Article XCIV of the Constitution.

Colonization.—An engineer has been sent to the Chones river to measure the land and divide it into farming-plots, and the resumption of work on the high road to connect Quito with the bay of Caráquez tends in the same direction.

Commerce.—The export movement through the ports of Guayaquil, Caráquez, and Callao in 1885 having amounted in the aggregate to \$4,353,959, it appears that there has been a falling off of \$874,911 in the export from Guayaquil, and of \$79,592 from Caráquez, compared with the corresponding period of 1884. The Minister of Finance has been unable to furnish the import figures for the year, Congress, for economical reasons, having suppressed the section for statistics.

Steamship Lines.—The Hamburg Kosmos Line of steamers was to begin touching regularly at Guayaquil, Manta, and Esmeraldas, in November, 1886. The English line of steamers has meanwhile also increased its calls at the Ecuadorian ports of Guayaquil, Manta, and Esmeraldas, on the trips to Panama, from monthly to fortnightly. A company was formed in October at Guayaquil for the purpose of establishing a regular line of vessels on the western coast of North and South America from California to Chili. During the height of the cocoa-crop, when Ecuadorian products abound at Guayaquil and there is frequently a lack of ship-room for Europe, some of the vessels of the company will be laid on the berth for European ports. The main reasons for the formation of this line were the high steamer freight and the objectionable transshipment of Ecuadorian products at Panama, causing risk and additional expense as well as loss of time, while fast-sailing vessels, careful handling of their cargo, and moderate freights will also enable the smaller shippers to supply the European market. On their return trip from Europe such vessels are to take cargo at leading west European ports direct for Guayaquil.

Railroads.—In September, 1886, work on the Southern Railroad was proceeding vigorously, and it was expected that the line would soon be in operation six miles beyond the Chimbo bridge. Simultaneously the Government made a contract for the construction of a railway line from the port of San Lorenzo to Ibarra, in the province of Imbabura, to be called the Pacific Railroad, and to be finished in six years, the Government paying during ninety-nine years to come an annual interest of 6 per cent. on the capital advanced to build the line out of its earnings.

In July a company was formed in New York under the name of "The Chones Railroad Company," with a share capital of \$500,000, for the purpose of building a narrow-gauge railway from the bay of Caráquez to the capital, Quito, the distance not exceeding 120 miles, being about half the distance between Guayaquil and

Quito. The new line in course of construction from Puerto Bolívar to Machala is of great importance to the rich province of Oro, inasmuch as it will eventually extend to Pasaje. Considerable headway has been made since the beginning of 1886 on the railroad line building between Guayaquil and Quito, under the management of the Polish engineer, Ernest Malinowski, who originated the project of the famous Oroya-Cerro de Pasco Railroad in Peru.

Salt Monopoly.—The Government made a contract with Mr. J. Kelly for the purpose of organizing properly the "Estanco de la Sal." Three kilometres of rails, after the Decauville system, were ordered from Paris, together with 30 cars, for the conveyance of the crude salt from the ponds to the Santa Elena Salinas, and thence to the wharf for shipment. A store has been built, capable of containing 5,000 tons. Rules for the manufacture of the salt have been laid down by Dr. Wolff, and operatives have been procured from Peru. Another store was built during the summer at the port of Naranjal, and a similar one at the port of Esmeraldas.

Cocoon.—There arrived at Guayaquil from the interior, for shipment abroad, in the year 1885, 24,056,521 pounds of cocoa, against 16,802,515 in 1884, being an increase for the twelve months of 7,254,006 pounds.

Ivory-Nuts.—The receipts of ivory-nuts at Guayaquil, during the first nine months of 1886, were to a great extent of an inferior quality, at prices varying from \$5 to \$5.25 a quintal on shore. There had been shipped abroad at Guayaquil, up to Oct. 1, 1886, 132,874 quintals, against 142,376 during the corresponding period in 1885, and 70,321 in 1884.

Agricultural Implements.—According to an American consular report, the implement most used in the lower section of the country is the *machete*, or cutlass. Iron bars, flattened at one end, are used for planting rice, sugar-cane, and Indian corn. In the mountainous sections, especially near Quito, crude wooden plows, having a single handle, are used. The part entering the soil is covered with a piece of iron fashioned by a blacksmith. It does not make a regular furrow, but works like a hog's nose, turning the soil both ways into ridges. Brushes bound together constitute the only harrow in use. No agricultural machinery is used, unless sugar-machinery may be thus rated.

Gold-Mines.—The recently discovered Zaruma gold-quartz mines are represented as being fabulously rich, as the Cascajal mines are also asserted to be. In September, mining-engineer Don Tito G. Sáenz de Tejada visited both on a prospecting trip on behalf of certain capitalists and quite a number of placer-mines along the banks of Chimbo river, where gold was being washed. On this tour through the Zaruma quartz-gold mines he assayed specimens of quartz an inch square containing half a dollar's worth of gold. Others have gone to inspect

the same mines, and agree with him that the newly discovered gold-mines of Ecuador have a great future before them. In May an English company, engaged in gold-mining at Portobello, in the Zaruma district, made its first gold remittance. This gold was obtained from quartz yielding, it would appear, two ounces of gold per ton, the quartz being reported free from pyrites. The mine was declared to be even more valuable than the celebrated San Juan del Rey gold-mine of Brazil.

Eruption of Tunguráhuá.—Between Jan. 11 and 14 there was a formidable eruption of the volcano Tunguráhuá. The ashes ejected spread thickly over hundreds of miles, damaging the crops, accompanied by a slowly rocking motion of the earth, and a roaring noise that was heard on Jan. 11 as far as Guayaquil. The province of Bolívar suffered most, the obscurity from the rain of ashes lasting thirty-two hours, and the cattle dying for want of food and water. In the villages of Patate and Pelileo the ashes in the streets were a decimetre in depth. Latacunga also suffered severely from the rain of ashes. Since February, 1797, Tunguráhuá had not been active, although it smoked at intervals, and its slopes were felt to be warm, especially in 1850 and 1851. On July 17, 1698, the Carhuairazo volcano, north of the Tunguráhuá and close to the Chimborazo, had caved in, causing a disastrous earthquake that desolated the province of Tunguráhuá. In April, 1886, the Tunguráhuá still gave signs of activity, and in September began pouring out lava again at short intervals, while clouds of dust and ashes enveloped the summit. While this was the state of affairs in Ecuador, the Ulbinas volcano in southern Peru, early in October, showed signs of activity. Although smoke had been issuing from it ever since the time of the Spanish conquest, the inhabitants became alarmed at its increased volume.

EDUCATION OF WOMEN, RECENT PROGRESS IN. In 1861 Vassar College, at Poughkeepsie, N. Y., was founded—the first institution, in the history of the world, designed to give to young women all the advantages of education hitherto enjoyed by young men. It was opened for the reception of students in the autumn of 1865. Many schools for women, it is true, were already in existence, styled colleges, of a high grade of excellence and doing admirable work. But Vassar was the pioneer institution explicitly intended and fairly equipped for becoming to women what the best colleges are to men. Within the twenty years that have elapsed since the opening of Vassar, great progress has been made on the novel lines projected by her founder; and during the past ten or a dozen years this progress has been surprisingly rapid.

In the United States the number of institutions for the higher education of women was, in 1874, 209, with 23,445 students; in 1884, 236, with 30,894 students. Adding to these the students in coeducation colleges and schools

of science, we have 43,307 students in 1884. Of the whole number, 18,196 are reported in preparatory departments, and 19,916 in collegiate, special, and graduate courses. The number of degrees conferred in 1884 was 884. Smith and Wellesley Colleges, both opened in 1875, are, like Vassar, thoroughly equipped for an education similar to that given in men's colleges. Vassar, besides several scholarships, has a fund of \$100,000, whose income is employed in aiding needy students. Wellesley has 24 scholarships of \$5,000 each. Bryn Mawr (Pa.) College, founded in 1880 and opened in 1885, claims the character of a university. It has borrowed from the Johns Hopkins University "the system of major and minor electives in fixed combination." The course in mathematics presupposes preliminary training through trigonometry, and the other courses equal advancement. Three classes of persons are admitted to the lectures—undergraduate students, graduates, and hearers. Bryn Mawr awards five fellowships annually—one in Greek, one in English, one in history, one in mathematics, and one in biology. These fellowships, bestowed as an honor and an approval of previous attainments, entitle the holder to free tuition, a furnished room in the college buildings, and the sum of \$350 annually. It also awards annually to a graduate of the college a European fellowship, which entitles the holder to the sum of \$500, applicable to the expenses of one year's study at some foreign university.

Many of the colleges for men are open on equal terms to women—conspicuously, Oberlin, Michigan University, and Cornell. The number of woman students at Michigan University in 1883-'84 was 177; in Boston University for the same year 154, out of a total attendance of 614. In 1879, the first year of its existence, the Harvard Annex for women had 27 pupils, and 50 in 1883-'84. Brown University has taken under consideration the subject of admitting women to its courses of study. Columbia College, New York, conferred at its last commencement the degree of doctor of philosophy on a woman.

Several associations, organized for this purpose, have been very useful in promoting the higher education of women. The Woman's Education Association has been actively employed for years in this way. A kindred association in New York was instituted in 1882. The Association of College Alumnae is giving special attention to the physical education of women. In 1883 the Western Association of Collegiate Alumnae was organized, and has been engaged in practical science. The Massachusetts Society for the University Education of Women gives encouragement and direct pecuniary help to needy women who are seeking for opportunities of advanced study. In all the colleges in the United States devoted explicitly to women, the standards have been steadily advanced, both for admission and for graduation.

In Canada, McGill University at Montreal, Victoria at Coburg, Queen's at Kingston, Dalhousie at Halifax, and University College at Toronto, admit women, in full or in part, to their courses.

England has within a few years shown a rapidly increasing interest in the superior education of women. University examinations have for some time been open to women at Cambridge and Durham. In 1884 a statute was passed admitting them to honor examinations at Oxford. University College, London, admits them to most of its courses, as does University College, Liverpool. The following colleges are exclusively for women: In London, Bedford College, Queen's College, Birkbeck Literary and Scientific Institution, Holloway College, completed in 1883, College of Medicine for Women, and a department of King's College for the higher education of women. Outside of London: Girton College and Newnham Hall, at Cambridge; Somerville Hall and Lady Margaret Hall, at Oxford; Bristol University College, at Bristol; Mason Science College, at Birmingham; Woman's College, annexed to Owen's College at Manchester; and Yorkshire College, at Leeds. In 1884 Girton College reported the number of students who had been in residence since it was opened as 181. Of these, 80 obtained honors according to the Cambridge University standard: 28 in classics, 22 in mathematics, 14 in natural science, and one in theology.

In Scotland, Edinburgh University and Glasgow University grant examinations for women. Aberdeen University gives a higher education certificate, and St. Andrews has founded the degree of *literate in arts*, about equivalent to master of arts. Queen Margaret College, especially for women, has recently been opened.

In Ireland there are two colleges for women, Queen and Alexandra, both at Dublin. The Royal University of Ireland and the Dublin University give them examinations.

Passing to the Continent, evidences of progress are apparent. In Austria-Hungary there has been, it is true, a retrogression, the entrance of women to the university courses, which was for a while permitted, being now forbidden. In Germany also the Leipsic University, at which women were allowed to follow the courses between 1871 and 1880, no longer grants this privilege. At the other universities women were never admitted. In Belgium the University of Brussels admitted women in 1881, and a few have been regularly in attendance since then. The same is true of the Universities of Liège and Ghent. In the University of France women are admitted to the courses of the different faculties. In 1882-83 the Faculty of Medicine numbered 50 female students. Italy has been the leader in the liberal education of women. Cornaro Pisacopia and Novella d'Andrea gave luster to the University of Padua, and the University of Bologna had a woman, Clotilde Tambroni, as

Professor of Greek, up to 1817. At Turin, Pavia, Padua, and Rome, diplomas have been conferred on women in medicine, law, philosophy, and natural science. Switzerland surpasses all the Continental countries in the number of woman students. In 1882-'83 there were 52 women at the University of Geneva, 36 at Berne, and 24 at Zürich. The doctors' diplomas given to women up to 1882, are 41 for medicine at Berne, and 25 at Zürich. At Zürich the conditions of admission are severe, requiring a sufficient knowledge of mathematics, and three languages, to pursue the proper studies. In Spain and Portugal the universities are shut against women, though in the latter country the subject of opening them is under discussion. In the Netherlands there are no enactments preventing the attendance of women at the universities, and quite a number avail themselves of their privilege. In Denmark and Norway the universities are open to women, and in Sweden there are provisions for their higher education. A woman recently received the degree of doctor of philosophy at the University of Upsala.

EGYPT, a principality of Northern Africa, tributary to Turkey.

Area and Population.—Egypt proper is contained within the limits of the narrow valley beginning at the cataract of Assouan, in $24^{\circ} 5'$ $23''$ north, where it has a width of about five kilometres, spreading as the Nile descends to an average of twenty-five to thirty kilometres, and then widening into the large plain through which the Nile flows in two branches and pours into the Mediterranean in latitude $31^{\circ} 5'$. The Nile in its sinuous course from Assouan covers a distance of 1,415 kilometres. The length of the delta from the point where it bifurcates to the sea is 175 kilometres in a straight line, and from Aboukir to the Peluse it has a width of 250 kilometres. It has an area of 29,400 square kilometres, being nearly the exact size of Belgium (29,455 kilometres). The amount of land in the moudiriehs, exclusive of sandy wastes and uninhabitable parts, is 5,977,423 *feddans*; to which may be added land growing date-trees, surface of Nile from Wady Halfai to the sea, surface of canals, railways, dikes and roads, towns, fortifications, marshes, sand-hills, lakes, etc., 7,782,773 *feddans*. (A *feddan* is nearly equal to an acre. *Kharadji* and *ouchouri* are terms denoting fiscal divisions of land.) There has been no change in the average tax per *feddan* or *ouchouri* and *kharadji*, which, since the budget of 1884, was fixed at $51\frac{1}{2}$ piasters on the former and $128\frac{1}{2}$ piasters on the latter.

The agricultural population forms 61 per cent. of the total, and the foreign element 134 per cent. This was so prior to the insurrection of 1882, but note must be taken of the English army of occupation and the great number of Englishmen who have since entered the civil service of the Government. The figures in the last census, of 1882, must therefore be

somewhat changed. At that time the total number of foreigners resident in Egypt was 90,886. There were Greeks, 37,301; Italians, 18,665; French, 15,716; Austrians, 8,022; English, 6,118; Germans, 948; other foreigners, 4,116. The native population numbered 6,469,716; nomad, 245,779. Total, 6,715,495. The increase of the foreign population is chiefly in the cities of Alexandria and Cairo. The last census gave Cairo 368,108; Alexandria, 208,755; Damietta, 34,046; Tantah, 33,725; Mansourah, 26,784; Zagazig, 19,046; Rosetta, 16,671; Port Said, 16,560; Suez, 10,913. The domain of Egypt prior to the revolt in the Sudan extended to the Nile sources. The Government has withdrawn its lines as far north as Assouan and Wady Halfai.

Government.—The administration of Upper and Lower Egypt is divided into 14 moudiriehs or provinces, which are placed under the control of governors and sub-governors known as *Moudirs* and *Nazirs*. The cities of Cairo, Alexandria, Suez, Ismailia, Port Said, Rosetta, and Damietta have each a governor and prefect of police.

A special body of gendarmes was formed immediately after the insurrection of Arabi Pasha, for service in the provinces, and also for Alexandria and Cairo, and was placed under the control of a director-general attached to the Ministry of the Interior. This body is still in the exercise of its functions, but it has been found insufficient, and Moukhtar Pasha, the Sultan's commissioner, recommends that it be suppressed, and that the ancient system of the *cavas* be substituted, not only as a measure of economy, but the better to insure security, which leaves much to be desired. On the 7th of January of this year the Khedive found it necessary to issue a special decree in each moudirieh for the repression of brigandage, and summary punishment was meted out to the offenders. On the 1st of April, in the provinces of Garbiah, Dakaliah, and Fayoum, 80 brigands were hanged, 21 were condemned to penal servitude for life, and 40 to serve various terms of imprisonment.

The Sheik-ul-Islam, who resides in Cairo, is umpire between natives in all matters appertaining to minor disputes or criminal cases. An attempt has been made to replace the courts of the Cadi by native tribunals, formed somewhat after the model of the Mixed Tribunals; but the notorious venality of some of the native judges has caused this intention to be abandoned. The Mixed Tribunals, composed of the Court of First Instance and a Court of Appeals, the judges being chosen from all nationalities as well as native Egyptians, have successfully accomplished the object for which they were formed, and have been prorogued until the year 1889 by khedivial decree.

The Egyptian ministry is at present composed of five members, among whom the departmental work is distributed as follows. 1. President of Foreign Affairs. 2. Finance. 3.

War, Marine, and Interior. 4. Public Works. 5. Education. Nubar Pashar is still President of the Council of Ministers, most of whom have been chosen for their conspicuous lack of character and capacity, the better to constitute them what they are in fact, mere tools to assent to whatever measure may be proposed by a minister who himself is the creature of the army of occupation.

Notwithstanding the notoriously bad administration in Lower Egypt, the loss of the trade of the Sudan, which has been absolutely shut off by the insurrection of these provinces, together with the burden of the costs of an English army of occupation and civil employés that swarm at exorbitant salaries in all the departments, abundant harvests contributed to produce a state of comparative prosperity for 1886, which was in marked contrast with preceding years.

Army and Navy.—The Egyptian army is still an unknown quantity and in a transition state. Negotiations to determine its standing and composition are still pending between Moukhtar Pasha, the Sultan's commissioner, and Sir Henry Drummond Wolff. Moukhtar has proposed that the minimum of the army shall be fixed at 18,000 men, at a cost of £100,000 to £150,000, to be recruited in Asia Minor and Roumelia. The Sultan favors, however, an army entirely Egyptian, commanded by Turkish officers. The English, on the other hand, claim that the majority of the officers shall be English. Moukhtar proposes that the £200,000 accredited to England for the cost of her army of occupation shall be applied to the maintenance of the Egyptian army. England, as yet, has refused to accept the proposition as to the Turks, alleging that their immixture in Egyptian affairs would destroy the work of forty years of civilization. The navy consists of the limited number of war-vessels heretofore reported without any addition, and scarcely merits particular mention. Egypt, therefore, has been unable, even if she dared, to resist the seizures of her territory that England has made during the year.

The English Occupation.—Since the rebellion in 1882, an English army of occupation has remained in Egypt. Its strength at the end of 1885 was 8,000 men, principally infantry. France has on several occasions asked that England should name a day when she would leave Egypt; but up to this time no definite answer has been made. Lord Salisbury, in a speech at the Lord Mayor's banquet on Nov. 10, 1886, said: "The different Cabinets have all considered that our sojourn in Egypt should not continue except for a limited time—only it is not a question of a limit of time, but a limit to be marked by the achievement of the work undertaken. Egypt has no longer any fear from invasion from the desert. The amelioration of the interior has been rapid, order is established, and the finances offer a most satisfactory prospective. But they are

not so much so as to permit us to say that our task is satisfactory." Clearly, England does not fancy giving up the country.

On the other hand, France through M. Freycinet has spoken clearly. On the 27th of November, in the Chamber of Deputies, M. Freycinet said: "France has not only general but direct and special interests, which pledge us in the most formal manner. France has in that country a powerful colony, which at all times has worthily upheld the French name. France has traditions there, an entire past which we ought not to repudiate. Egypt, as has been said, is a sort of meeting-place of the roads of the old world. It is the point of junction between Europe and Africa, the great highway of the commerce of nations. The master of Egypt is the master of the Mediterranean. If a great power settles there in a permanent way, a great blow would be dealt to France in the Mediterranean. France can not grow accustomed to the idea that Egypt should pass definitely into the hands of a great European power. We have several times opened negotiations with England; we have taken care to conduct them with the firmness appropriate to our interests, and the respect due to a great power whose just susceptibilities should not be wounded. No, we have no intention of putting forward a demand, because if it were to ourselves that the application were made we should not allow it. But we have said to England, the hour has come when a solution should be arrived at. It is necessary to Europe and to the good understanding that ought to exist between France and England. We have appealed to the mutual cordiality of our sentiments, and have no doubt that England will be influenced by their language, for she understands both its sincerity and its importance." Europe is at this moment, in the last days of the year 1886, under the *coup* of the expressions both of the English and the French ministers.

An English army has its headquarters at Assouan, with advanced posts at or near Wady Halfai. As late as Dec. 15 of this year the rebels had made no movement in force to carry out their threat to invade Lower Egypt, but contented themselves with attacking the outposts in a desultory way. The death-rate among the English soldiers by reason of the extreme heat reached 200 deaths from this cause during the trimestre ending in July. This was also true of Souakin, on the Red Sea, where the white troops were replaced by Arabs. The British Government has signified its intention of reducing the army of occupation to five battalions, to be quartered at Assouan, Cairo, and Alexandria.

Finance.—The financial situation at the close of the year 1886, as has been seen by the statements made by Lord Salisbury, is quite satisfactory, notwithstanding the untoward effects of the Soudan disasters, and the still disorganized condition of affairs in Lower Egypt.

On the 4th of May Mr. Edgar Vincent, finan-

cial adviser to the Minister of Finance, submitted the following report:

Receipts for the year 1885 amounted to	£ (E) 9,637,173
Receipts for the year 1884 amounted to	9,403,294
Mr. Vincent estimates receipts for year 1886	9,241,586
The expenditures for the year 1886	9,282,746
Leaving a surplus of	8,840

The diminution of the revenue Mr. Vincent declares was caused by the reduction upon the *impôt foncier*.

It will be remembered that a financial scheme was drawn up, to which the powers in International Convention agreed, and which was ratified by the French Senate July 7, 1885. The agreement guaranteed a loan of £9,000,-000, to be applied in liquidation of the Egyptian debt, the loan to be liquidated by the repayment of £325,000 annually, and this sum to be considered the first charge against the Egyptian revenues until the entire loan is lifted.

The guaranteed loan by the conference of March, 1885, was issued simultaneously in London, Paris, and Berlin, in August, 1885.

The total debt of Egypt at the end of 1885 was:

Guaranteed loan	£9,000,000
Unified debt	55,991,000
Privileged debt	22,297,000
Domains loans	7,644,000
Dairia loans	8,745,000

Total £108,677,000

The administration expenditure of the Khedive's Government was limited to the sum of £5,237,000. Any surplus over the year's receipts was to be paid over to the Commissioners of the Public Debt, for the purpose of making good an imposed deduction of 5 per cent. from the interest on the Suez Canal shares held by England. The principle of the *enquête* was admitted and declared for an "exhaustive investigation into the revenue-earning capacity of Egypt"; and further, that if, at the end of two years, it should be found necessary to reduce the interest on the coupons, the Khedive should summon an International Commission, like that of 1880, to make general inquiry into Egyptian finances. These two years have nearly expired, and there seems no reason to appeal to this *commission d'enquête*. The Commissioners of the Public Debt announced, on the 26th of October, 1886, that the surplus of the payment of the November coupon of the unified debt would suffice to make good any deficiency in the unassigned revenues, and to reimburse the 5-per-cent. coupon-tax levied during the last two years, besides leaving a balance which, under the convention, will be equally divided between the *caisse* and the Ministry of Finance.

On Dec. 1 the Council of Ministers at Cairo passed the budget for 1887, showing a surplus of £56,000. On December 15 the telegraph reported that the *caisse* of the public debt granted to the Government the sum of £200,-000, on account of the sum fixed by the London Convention for capitalization of pensions.

Commerce.—The latest reports place the value of exports and imports as follows:

EXPORTS.	IMPORTS.
Cotton	£3,237,749
Cotton-seed	1,464,101
Beans	722,290
Wheat	439,045
Sugar	376,617
Textiles	71,021
Skins	190,569
Rice	138,342
Gum	128,049
Maize	233,492
Ostrich-feathers..	19,939

Customs at Port of Alexandria.—The receipts of the custom-house at Alexandria for the year 1881 amounted to £71,449; for the year 1882, £66,880; for the year 1883, £73,180; for the year 1884, £83,129; and for the year 1885, £114,590.

Railways, Telegraph, and Post.—Egypt has a railway system of a total single-line length of 1,276 miles. The length of the lines working in 1885 was 900 miles. The proportion of the working expenses to the receipts in 1884 was 40 per cent., the average proportion from 1880 to 1883 being 36½ per cent.:

The receipts in 1881.....	£1,290,882
The receipts in 1882.....	1,240,573
The receipts in 1883.....	1,212,793
The receipts in 1884.....	1,408,564
The receipts in 1885.....	1,482,379

The telegraphs belonging to the Egyptian Government at the end of 1885 consisted of a total length of 2,701 miles, the length of wire being 5,221 miles. This includes a line of 75 miles constructed in the year 1884, in the province of Fayoum. The Eastern Telegraph Company have a line to Cairo, 453 miles in length (with ramifications). The Egyptian post carried 6,575,000 letters inland and 4,631,000 foreign during the year 1884, being an increase of 16 per cent. over the year 1883. The number of post-offices at the end of the year 1884 was 187.

The Soudan.—The Egyptian Government designates, under the generic name of Soudan, all that country situated south of the second cataract. The Eastern Soudan is a level region, surrounded by a rim of mountain-chains. The provinces of Sennaar, Fasogle, and Taka, bordering on the Abyssinian plateau, are exceedingly fertile, being copiously watered and enriched by annual alluvial deposits like the delta of the Nile. They produced abundant crops of cotton, sesame, pulse, durrah, wheat, and other grains. Their jungles and forests harbor the elephant, the rhinoceros, the lion, the leopard, the giraffe, zebra, and buffalo.

The Western Soudan proper, which comprises the provinces of Kordofan and Darfour, has many of the characteristics of a desert climate. Except in the districts of Bara and Abou Haras, in Kordofan, and other depressed oases or mountain-regions, the vegetation is scanty and the earth clothed with green only during the brief rainy season. The climate of the Soudan is divided into *shittah* and *saif* (winter and summer), which is better interpreted as a

rainy and a dry season, varying in length according to latitude. At the Nile sources, where the Lakes Victoria, Albert, and Ibrahim act as water-sheds, it rains almost constantly. To the south of Khartoum there is a great waste of marsh, 1,200 miles in extent, whose inhabitants present the most wretched state of misery and degradation. At Gondokoro *terra firma* begins, and both the climate and the natives are vastly superior to the country in the north.

Khartoum and Adjacent Provinces.—The splendid conquest of the great Mehemet Ali in 1821 became a source of much revenue during succeeding administrations. Ismail Pasha, anxious to link his own name with that of his illustrious grandsire, named Gen. Gordon the Governor-General of the Interior Provinces, and attached to him an American officer as his chief of staff, with orders to carry the Egyptian flag to the Great Lakes. Col. Chaillé Long, following the river to its sources, executed the order of the Khedive, and not only made a treaty whereby the powerful negro monarch, M'Tsé, King of Uganda, recognized the authority of the Egyptian Government, but, returning, discovered in the navigation of the hitherto unknown river (from a point from which Capt. Speke had been driven) a third great basin and lake, which was named Lake Ibrahim by the Khedive in honor of his father, Ibrahim Pasha. The navigation of this river and discovery of the lake solved finally and definitely the vexed question of the Nile sources, the honor of the discovery of which, on the authority of Gen. Gordon, belongs entirely to Speke, Baker, and Chaillé Long. The importance of water communication between the Egyptian posts and the newly acquired territory was incalculable, and subsequently led to the appointment of Dr. Emin Bey as the Egyptian governor. The insurrection of the Mahdi, the causes that led thereto, the return of Gen. Gordon to the Soudan, the rescue expedition of Sir Garnet Wolseley, the fall or evacuation of Khartoum, and the disappearance of Gen. Gordon, have been treated at length under the head of EGYPT in the "Cyclopaedia" for the preceding year. The English expedition, having failed, retired from the Soudan, and was followed by the victorious barbarians to Wady Halfai. The authority of the Egyptian Government in the Soudan has been suspended in view of the successes that have attended the insurgents. Since the 26th day of January, 1885, when Khartoum was reported by Gen. Wilson as having been seen in the hands of the Mahdi, there has not been one reliable word as to the fate either of Gen. Gordon or of the city of Khartoum. As late as the 15th of December it was reported that the Soudan capital had been razed to the ground; but since then this account has been positively denied by an intelligent Arab. The mystery with which the whole matter has been enshrouded is absolute. The rebels send their

messengers into the Egyptian lines to give just such information as may seem fitting to them. On the 9th of December two Arabs arrived in Korosko and reported that the "dervishes had all been killed by the Shukeriah and Dabaya tribes, who had laid waste the country of Sennaar. Osman Digma, reported slain at divers times, has been resurrected, and had been sent on a special expedition to subdue revolted tribes," etc. Mohammed El-Kheir arrived, it is said, on the 6th of November at Berber with his officers to collect taxes. Abdallah has assumed the title of El Mahdi, Mohammed-Ahmed having died several months ago at Omdurmann, opposite Khartoum, of small-pox, where a handsome tomb now marks his resting-place, which is looked upon by the Moslem Soudanieh as no less sacred than the tomb of Mohammed at Mecca. On the 8th of September Dongola was in the possession of the rebels, who were estimated at 8,000 strong. The country at that time was reported as suffering from a famine by reason of the invasion. Several skirmishes had taken place with the outposts, but no serious engagement.

Cossacks in the Soudan.—From Russia comes the information that a party of Cossacks are actually serving in the rebel army of the Soudan; and also that another Cossack party is working its way into Abyssinia with presents to King John. These Cossacks are said to be "free lances," who, disappointed in their intention to settle in the western Caucasus, have turned their faces toward Abyssinia, possibly with encouragement from the Russian Government. Following this it is announced that the Negus of Abyssinia has decided to merge the Abyssinian Church (Copt) with the Russian.

Gordon Bonds.—In Cairo, on the 22d of February, it was discovered that a strong ring had been formed for the issue of fictitious bonds alleged to have been issued by Gen. Gordon during the siege of Khartoum. Several prominent Government officials were compromised.

Fraud in the Daira Sanieh.—On the 4th of July a commission d'enquête was organized for the purpose of investigating frauds committed in the Daira Sanieh. The Egyptian director and others were found to have substituted fraudulent papers relating to contracts.

Diplomatic Incident.—During the French invasion in 1797, one Sheik Suleiman obtained recognition as a French subject. The French consul, some time in July of this year, had occasion to give a certificate of protection to one of the descendants of the Sheik, good for one year. The Egyptian Government held, nevertheless, that they were Turkish subjects, and refused to acknowledge the certificate. The French consul thereupon wrote to the Egyptian minister, declaring that, if the certificate was not recognized as issued by him, he would within the twenty-four hours demand his recall. Nubar Pasha immediately recognized the consul's claim, accompanying his reply with the necessary apology.

Death of General Count Bellegarde.—On the 13th of January Gen. Bellegarde, Privy Councilor to the Emperor of Austria, died in Cairo, and was buried with great pomp and ceremony. The body was escorted by both English and Egyptian troops, and a large civic escort.

The ex-Khedive Ismail.—On the 31st of May the ex-Khedive addressed a circular to the consuls-general, requesting them to hold a meeting in Cairo, in order to decide upon a *modus procedendi* as to his claim, amounting to the sum of £5,000,000, besides a permanent yearly budget charge of £150,000. On the 27th of September Ismail's agent, with two armed Albanians, took possession of property contiguous to the Ismailia Palace, or the ground of the palace, but they were ejected soon after. About this time the Council of Ministers, the Khedive Tewfik presiding, resolved not to admit the claim of the ex-Khedive, his father, who asked that a pension of £20,000 should be accorded to his mother.

In the matter of the seizure made by Ismail's agent, the Mixed Tribunals have recently rendered a decision sustaining the action of the ex-Khedive's agent.

The ex-Khedive supports several establishments in Europe, the palace of La Favorita at Naples, a house in the rue Neuve des Mathurins in Paris, and another in London. The greater number of his wives remain in the palace at Naples, but he recently arrived in Paris accompanied by four of his favorites.

The Suez Canal.—On the 8th of January, 1885, the French ministry proposed to the Cabinet of London that the Suez Canal should be neutralized, and the free use guaranteed to all nations. England, in the early part of December of this year, semi-officially declined to accept this proposition, if it should tend to bar the passage of her fleets in time of war. The receipts for the year 1885 amounted to 65,049,945 francs; the expenditures of every nature amounted to 31,021,178 francs, making a total earning of 34,028,767 francs.

During the year 1885, 3,624 ships, representing 6,335,753 tons, passed through the canal, compared with the year 1884, an augmentation of 340 ships and of 464,253 tons. This is the more remarkable in view of the commercial, industrial, and maritime depression that prevailed during the entire year. This is evident in the railway reports of France, which show a diminution in receipts for that year of 37,000,000 francs; while those of England lost 21,000,000; the commerce of France fell of 175,000,000; the commerce of the United States, 475,000,000; the commerce of England, 1,013,000,000.

In accord with the Egyptian Government, the administrators of the canal are engaged in enlarging and deepening the channel along its entire length from Port Said to Suez, adding thus an additional width of 15 metres and depth of 8½ metres. The business of the canal is best illustrated by the following:

MOVEMENT OF SHIPS THROUGH THE SUEZ CANAL.

YEARS.	No. of ships.	Tonnage.	Receipts.
1870.....	486	486,690,870	4,845,771,42
1871.....	765	761,467,050	7,593,835 18
1872.....	1,082	1,160,748,542	14,377,092 17
1873.....	1,178	1,367,767,820	20,850,726 15
1874.....	1,264	1,681,650,140	22,667,791 94
1875.....	1,494	2,009,984,091	26,480,790 61
1876.....	1,457	2,096,771,613	27,651,498 20
1877.....	1,668	2,355,447,693	30,180,928 72
1878.....	1,593	2,269,678,815	23,845,672 87
1879.....	1,477	2,268,382,194	27,181,116 77
1880.....	2,026	3,057,421,581	36,492,620 25
1881.....	2,727	4,186,779,769	47,198,582 67
1882.....	3,193	5,704,808,885	55,421,089 59
1883.....	3,807	5,775,861,795	60,558,488 57
1884.....	8,234	6,871,500,925	58,628,759 82
1885.....	8,624	6,385,752,984	60,957,269 97

Of these there were 2,537 commercial ships, 580 postal, and 507 composed of transports, canonnières yachts, rams, and other vessels of war. The nations were thus represented: English, 2,734; French, 294; German, 155; Holland, 139; Italian, 109; Austro-Hungarian, 69; Norwegian, 30; Russian, 29; Spanish, 26; Ottoman, 16; Egyptian, 7; Portuguese, 5; American, 3; Danish, 3; Japanese 2; Belgian, 1; Greek, 1; Persian, 1.

On May 27 an action was brought against "La Compagnie Universelle du Canal Maritime de Suez," by the Egyptian Government, for customs dues on dredges and plant used in the service of the canal, and the case was decided by the Mixed Tribunals in favor of the Government.

The company have within a short time purchased, for the service of the canal a sweet-water way leading to the Suez Canal, for the better alimentation of points leading from Ismalia to Port Said.

Discovery of Petroleum.—On the 11th of April the Egyptian Government announced that the sources of petroleum discovered several years ago at Gebel-el-Ziet (Oil Mountain) on the Red Sea, and also at Djemisah, were running oil at the rate of 150 metres cube per diem, and that the Government was prepared to deliver samples of the oil at Suez, and had granted £3,000 in order to continue further exploration. On the 18th of September the convicts employed in working the wells revolted, the troops were called upon to quell the riot, and killed twenty-four men. The discovery promises to become a source of great revenue for Egypt.

Osman Digma, reported as having been killed, has been resurrected, and when heard from, on the 18th of June of this year, was actually threatening Tami with a large force. He has successfully held the Suakin route against all the efforts of the English either to open it or to construct the proposed railway from Suakin to Berber.

Annexation in the Red Sea and Indian Ocean.—Egypt, by virtue of cessions from Turkey, held undisputed control over the province of Harrar, the ports of Suakin and Zeilah, and by virtue of conquest claimed the port of Berbera,

Socotras, Cape Guardafui, and the east coast of Africa down to the equator. England seized in the commencement of the present year Harrar, Zeilah, and Berbera, and as late as October 30 took possession of the island of Socotra. Italy, on the other hand, in accord with England, seized and occupied with Italian troops the ports of Assab and Massouah. France has had possession of the port of Obok, which she obtained several years ago by right of purchase from Menelik, King of Shoa. France has also obtained a foothold at Madagascar and in the Comoro islands. Germany, not to be outdone, has sent a squadron to Zanzibar to execute a naval demonstration there, it is said, to demand reparation for the murder of the late Dr. Jühlke, a German subject, who was murdered at Kisimayu. The demonstration is in fact intended to strengthen the hands of the German colony adjacent to Zanzibar. A German squadron was before Zanzibar on Dec. 25.

The seizure of Massouah by Italy was represented by Egypt, in so far that she protests that she should not pay the annual tribute of £35,000 heretofore paid by her to Turkey, but that it should be paid by Italy. In consequence of the reported removal of the French flag at Dongarita, a point on the Somali coast, over which both England and France claim the right of a protectorate. It is said that the French Government has requested explanations concerning the motives for the action of the English resident at Aden.

The Porro Expedition.—On January 26, Count Porro, an Italian subject, quitted Naples in command of an expedition organized by the Commercial Exploration Society of Milan and the Italian Geographical Society, for the purpose of entering Harrar and the Somali country. The Emir of Harrar, when he heard of it, sent a number of his armed men ostensibly to act as friendly guards. When near Arton in the interior, the arms of the Count and his companions were stolen, and the whole party treacherously murdered.

The King of Uganda and the Massacre of Missionaries.—King M'Tsé died in 1884, and was succeeded by his son, Prince M'Wanga, who has recently caused Bishop Hannington to be put to death and many Christian converts burned at the stake. A dispatch dated Dec. 15 announced that King M'Wanga has attacked and defeated Keba Rega, the King of Unyoro. From this it is inferred that Emin Bey, the Egyptian governor, is in peril.

Emin Bey, lately named a pasha by the Khedive of Egypt, is an Austrian subject by the name of Schnitzler. He joined the service of the Government of the Equatorial Provinces some time in 1878, for the purpose of pursuing his botanical investigations, and was made sub-governor of the extreme southern provinces, extending to Uganda, by Gen. Gordon, when the latter was Governor-General, with headquarters at Gondokoro, but which he subsequently removed to Khartoum, leav-

ing Emin Bey to work out his destiny in the interior region. It seems that Dr. Schnitzler has been assisted by Dr. Junker, a Russian subject, whose arrival at Zanzibar on the 4th of December of this year has inspired the British Government with the idea of sending a "rescue expedition" to Emin Bey, who, it is alleged, is placed in great peril by reason of the attack made upon the King of Unyoro by the King of Uganda. The last letter, dated July 7th of this year, however, makes no mention of his dangers, but speaks particularly of the scientific work in which he is engaged, and of the small-pox epidemic, which is decimating the country. Several days after the arrival of Dr. Junker, the following dispatch was received from Zanzibar, dated December 10: "Dr. Junker, who arrived here last week from the interior of Africa, will leave on the 21st for Cairo. He reports that Emin Pasha, by the latest advices, was well, and had reduced the rebels to submission as far as Lardo, on the White Nile, with which place he was holding daily communication by steamer." The "Kreuz Zeitung," of Berlin, in commenting on the work of the East African Delimitation Conference, which met in London, says: "The English, with their usual unselfishness, have appropriated the territory between the Kelima-Njaro and the Tana river, forming one of the best routes into the interior. The Tana leads across the Renia to about Lake Nimwascha, or pretty near the 36th degree of east longitude, while the Victoria Nyanza stretches out its eastern point to the 35th degree of east longitude. England has therefore secured the route to the Victoria Nyanza, the source of the Nile, and from this point of view quite a new aspect is lent to the zeal with which a great expedition is being organized in London, with the ostensible object of releasing Emin Bey (now Pasha) and Cassati. The £30,000 to be employed for this purpose will be a little investment in view of the aim to be achieved. On pretense of pursuing a humane purpose, the English would at once show their power in those regions and suddenly take possession of the route to the interior lakes."

Mr. H. M. Stanley, the distinguished explorer, was recalled from America, where he had engaged to make a lecture tour, and, returning to England, was given £10,000, as a contribution from the Egyptian treasury, and £20,000 from alleged private sources, Mr. Stanley left England on the 30th inst. for Africa, to take command of an expedition for the rescue of Emin Pasha. England's jealousy has undoubtedly been aroused by the encroachments of Germany on the east coast, and her imperiled commerce, as much as the peril of Emin Pasha, is doubtless the motive of an expedition in which the hand of the English Government is apparent.

Excavations and Discoveries.—On the 15th of June, in the presence of the Khedive, Moukhtar Pasha, and Sir Drummond Wolff, the bod-

ies of two royal mummies, lately discovered in the tomb of Deir-el-Behri, were unwrapped by M. Maspero, and found to be those of Rameses II and Rameses III, kings who belonged to the most brilliant period of the ancient empire, and that which succeeds to the expulsion of the Hyksos, who lived 1600 years b.c., and about the time of Moses.

The excavation of the Sphinx is still in progress. This gigantic animal, according to Maspero, occupies the center of an amphitheatre of rocks in the form of a bowl, which seems to have been quarried by the hand of man, it having been formerly a united surface, which was dug out, leaving in the center a block out of which to sculpture the figure of the Sphinx. This colossal work, Maspero declares, dates from a time anterior to the first dynasty.

The discovery of "the House of Pharaoh at Tahpanhes," by Mr. Flinders Petrie, the discoverer of the ruins of Naukratis, has excited great interest among the students of history. (See *Archæology*.)

Sir H. Drummond Wolff's Mission.—Sir Henry was accredited by the English Government as envoy extraordinary to the Sultan in July, 1885, for the purpose of establishing an *entente* with the Porte in matters pertaining to Egypt. In November of the same year Sir Henry went to Egypt, where he was followed in the beginning of this year by Moukhtar Pasha as a commissioner on the part of the Sultan. Several conferences have taken place, but nothing has, as yet, been concluded. It is said that Moukhtar claims that the pacification of the Soudan may be speedily expected as soon as the English withdraw their troops from Egypt. Sir Henry has been recalled to England, and the Porte has (Dec. 9) sent a note to the British Government, again intimating the desire of the Ottoman Government to discuss the question of the evacuation of Egypt. The year 1886 closed without any definite arrangement or solution of the question, which continues to excite much interest in diplomatic circles.

ENGINEERING. Bridge at Oporto.—The two cities of Oporto and Villanova de Gaia together contain 150,000 inhabitants, and, as the commercial centers of a rich agricultural and wine-growing country, are the wealthiest and most active towns of Portugal. They are built upon the opposite banks of the river Douro, and hitherto the means of intercommunication have been inadequate. A suspension-bridge was built about fifty years ago, but it did not meet the demands of traffic, and, moreover, was not considered safe. Recent improvements in rigid bridges of wide span led the Portuguese Government to give out contracts for a bridge that was finished in August, and is in many respects a remarkable structure. The necessary extreme length was 1,278 feet, and, as the depth of water and the nature of the bottom in mid-channel precluded the possi-

bility of a central pier, it was decided to have but one span. The conditions favor this in some respects, for the banks are precipitous, and each city has an upper and a lower section. Therefore, two roadways were called for, one of them 160 feet higher than the other. A glance at the illustration will show how interdependent are the three parts, namely, the upper platform, the main arch, and the lower platform. The outward thrust of such an enormous arch would be tremendous at the piers upon which it rests, but the lower platform, like the taut string of a bow, receives part of this strain, and could probably sustain the

proached one another. The arch rests upon the masonry through steel rollers placed in steel coussinets, which in turn rest upon cast-iron beds that distribute the pressure over the masonry. The lower platform is divided into five bays by suspension-rods. It is composed of simple lattice-girders 29 $\frac{1}{2}$ feet apart and 10 $\frac{1}{2}$ feet between chords. The floor-beams are 10 feet apart, and five rows of longitudinals receive the plates of the roadway. A novel method was employed in mounting the arch. The piers and approaches to the arch being in place, shears were erected over each pier on the upper platform, and two cables, presumably

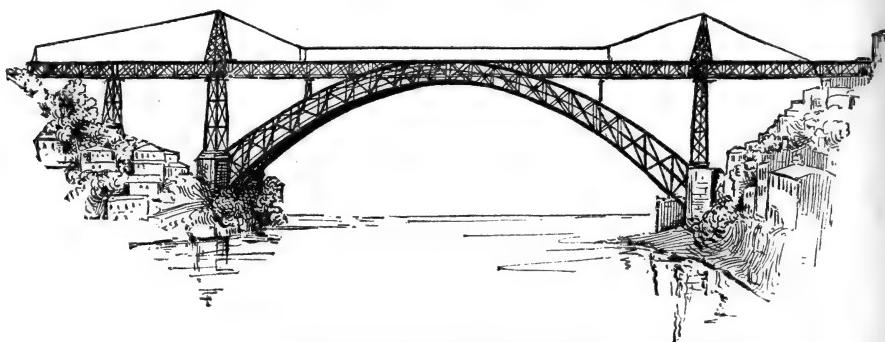

FIG. 1.—BRIDGE OF LUIZ I, OPORTO, LISBON.

whole of it in case of need. The great height of the arch—240 feet above low water—offers a dangerous leverage for high winds, and against this the upper platform with its lattice-girders affords ample provision. Taken in connection with the spread of the arch-trusses it renders the structure remarkably strong. The span of the main arch is the greatest in existence—566 feet. The thickness of the arch at the key is 26 feet, about $\frac{1}{2}$ of the span. The thickness increases downward until it reaches 55 feet at the piers. This reverses the plan followed in the great arch at Maria Pia, where the main girders approach one another and are united at the springers. The engineer, Mr. Seyrig, was led to make this change in view of the different service expected of the bridge. The Maria Pia is distinctively a railway-bridge where the load moves *en masse*, and the moment of strain at the key of the arch is of the first importance. With the "Luiz I Bridge," as it is called, at Oporto, the case is different, and it became possible to diminish the central thickness of the arch in view of the character of the expected load. Again, Mr. Seyrig assumed, though there may be two opinions in this particular, that the architectural effect would be better, with wider supports at the springers. Another and more obvious reason was that a roadway 26 feet wide had to be provided at the springers, and this would have seriously interfered with the proper distribution of cross-braces at that point, had the main arches ap-

of steel wire, were stretched across the river, passing over the shears and anchored securely on the shoreward side. These shears and cables are shown, still in position, in the drawing of the completed bridge (Fig. 1). They are also shown more in detail in Fig. 2. On the cables were traveling-pulleys, which could be run out to any point over the river. Through the pulleys the hoisting-tackle ran and was worked by windlasses at the base of the shears. Gas motors were used to drive the windlasses, and gave perfect satisfaction. The successive pieces of the arch were floated out on boats and hoisted thence by means of the tackle. The workmen soon learned to handle pieces of 6,500 pounds, raising them 195 feet, into position, where they were temporarily held by guys running upward and backward to anchorages on the piers. When the two demi-arches approached one another, measurements were taken, and one was found to be 3 inches lower than the other. It was therefore raised to the proper level. When everything was ready to insert the key-pieces, it was found that a difference in level of 2 inches existed, and that the space was too small by about 1 $\frac{1}{2}$ inch. The engineers had observed that the degree of separation was greatest in the morning; accordingly, everything was arranged to mount the last two pieces at an early hour on Aug. 11, 1885. One of them fitted accurately, while the other was $\frac{1}{10}$ of an inch too large, but this error was soon corrected, and the most difficult

part of the work completed. It has been objected that this method of construction is dangerous, but after the arch at Oporto had ad-

only two European bridges, the Alexandrovsky over the Volga, and the Moerdijk in Holland. The considerable local population rendered it desirable to provide a carriage- and foot-way, as well as a railway. The 15 spans are each 274 feet, giving a total length of 4,110 feet to the bridge proper, and the clear height above the water is 43 feet, which is 14 feet higher than the river has ever been known to rise. The carriage- and foot-ways are 30 feet above the railway, occupying the top of the structure. The right abutment and the first pier rest upon bed-granite. The rest of the piers, upon caissons sunk to a mean depth of 50 feet, and resting partly upon rock and partly upon the white clay of the locality. All the masonry of the piers is of granite quarried near by on the banks of the river. At either extremity the bridge is prolonged by viaducts each composed of three spans of parabolic girders which intersect the bridge at an angle to connect with the highway, while the railway continues its rectilinear course. These viaducts add 480 feet to the length of the bridge. The total cost was \$1,950,000. Into its structure there enter 883,000 cubic feet of masonry and 3,280 tons of Portland cement. The

iron-work weighs nearly 10,000 tons, exclusive of the caissons. It has been three years in building. Prof. Belelubsky, of St. Petersburg, superintended the construction with Engineer-in-Chief Beresin. Under a test of 8 locomotives on the rails and a dead-weight of rail-way-iron on the carriage-way, the deflection did not exceed $\frac{5}{200}$ of the length of each span.

Mexican Bridge.—Mr. J. Foster Flagg describes, in the "Transactions of the American Society of Civil Engineers," a bridge built by an ignorant Mexican peon that deserves a place among the triumphs of modern engineering. Mexican bridges are usually built of arched masonry, and anything like a truss is unknown to the natives. In the State of Colima, bridges of any kind are few, and there were none at all over the river Armeria owing to its depth and rapidity, especially in flood-time. The peon referred to chanced upon a stray number of "Harper's Weekly" containing a picture of a suspension-bridge. It

FIG. 2.—BRIDGE OF LUIZ I. MOUNTING THE ARCH.

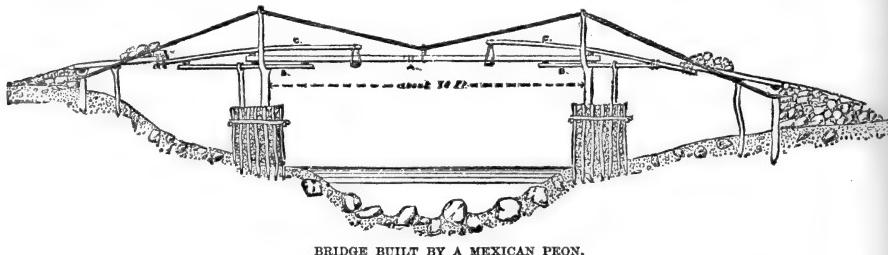

vanced well over the river two successive storms of great violence occurred, causing no damage beyond the demolition of some loose scaffolding.

Bridge and Viaduct in Russia.—A new Russian railway just completed is 285 miles long and connects two of the great lines that terminate respectively at Nicolaiev and Sebastopol on the Black Sea. The new road crosses the Jekaterine district, and the most interesting engineering features of its construction are a viaduct over a deep ravine through which runs the river Juquetz, and a fine bridge over the Dnieper river. The viaduct is remarkable for its height above the water, as well as for the depth of its foundations. The total length is 1,050 feet, and consists of five arches sustaining non-continuous lattice-girders. The track, on a level with the upper plats-bands, is 156 feet above the water and 222 feet above the bottom of the caissons.

The Dnieper bridge is exceeded in length by

aroused the dormant engineering spirit within him, and, being a ferryman, he went to work with such materials as the region supplied to substitute a bridge for his own advan-

ture stratum of strong clay existed, and it was only necessary to shore up the roof temporarily with strong timbers, to secure it against possible subsidence. In view of the

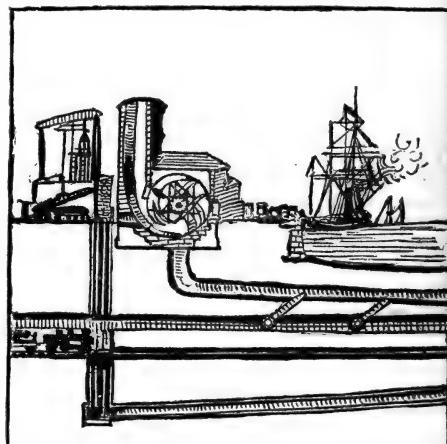

BRIDGE BUILT BY A MEXICAN PEON,

tage. His first attempt was on the suspension plan, the cables and suspenders being twisted from wild vines, passed over rude timber towers and anchored to boulders. No iron was employed. Mr. Flagg frequently used the bridge, being engaged at the time in constructing a railway near by. A freshet swept the bridge away before it was a year old but the peon, nothing daunted, went to work again and made a second one, as shown in the illustration, evolving from his own head several of the best principles of modern bridge-construction. The piers were made with cribs of driven stakes bound together and filled with stones. The suspension-cables were of twisted vines as before, bound together with lighter vines. The stringers of the main span in two pieces were tied together at A and supported there by the cable—the only direct use required of it. The towers were natural forked timber, the cables resting in an upper crotch, and the corbels, B B, in a lower crotch. The stringers were further supported by cantilevers, C C, which were loaded with stones near the abutments to balance the central strain. The rest of the abutment construction is apparent from the sketch. The roadway was only wide enough for the passage of one animal at a time, and proved strong enough for all the demands that were made upon it. It was in use for about 18 months, when a heavy freshet carried it away, and it is not known whether the experiment has been repeated or not.

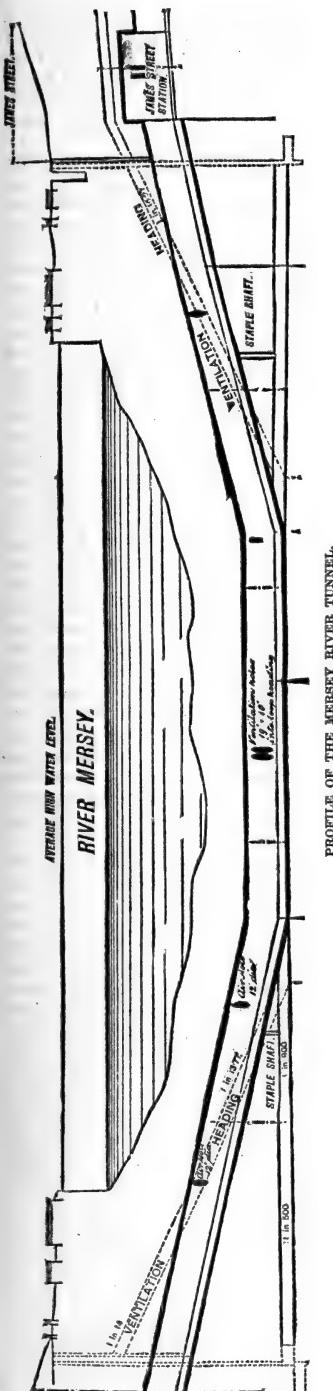

The Mersey Railway Tunnel.—This highly creditable example of subway construction was opened to the public with due ceremony by the Prince of Wales on Jan. 13, 1886. Its progress was briefly described in the "Annual Cyclopaedia" for 1885, but certain features of the completed structure deserve more detailed description. As a whole the work is notable rather for its magnitude and careful elaboration of detail than for any especial difficulty of construction. With the exception of about a hundred yards under the river, the tunnel runs through solid sandstone rock, and no precautions had to be taken against caving. Even where the rock fell below the crest of the tunnel it was found that a nearly water-

magnitude of the expected traffic, great care was taken to provide for perfect drainage and ventilation. To this end, drainage-headings were run in both directions from the central level at a slight incline shoreward, as far as the working shafts at each end, which were sunk to a sufficient depth, and provided with powerful pumps. These served to keep the main headings free from water during the progress of the work, and in their finished state serve the same office for the completed tunnel. The infiltration of water, however, through solid sandstone and the lining of blue Staffordshire brick, is very slight and will probably cease altogether through the gradual deposit of silt. The ventilation heading runs beside the central level and thence rises at a steep incline to the fresh-air shafts—one at either end of the tunnel—where two huge fans, respectively thirty and forty feet in diameter, maintain a perpetual current and change the air in the

TERMINAL ARRANGEMENTS OF MERSEY RIVER TUNNEL.

tunnel about once in seven minutes. The general arrangement of the three tunnels (air, drainage, and traffic, at their landward termini) is shown in the illustration.

The depth of the tunnel below the street surface at the termini is such that elevators, or, as the English more concisely call them, "lifts," are necessary at the stations. There are three of these at each of the main stations of the tunnel, each being a room 17×20 feet, handsomely lined with hard woods, and supported by framed iron floors. Each lift will carry 100 passengers at a time. The lifting power is hydraulic, fed from a large tank.

The distance between the two water-side stations is 2,000 yards. The greatest depth of the tunnel-crown, below average high-water mark in the Mersey, is 130 feet, of which 30 feet are below the river-bed. The deepest elevator shaft is at the Hamilton Square station, Birkenhead (87 feet 6 inches); that at James Street station, Liverpool, is 76 feet 6 inches. In general profile that part of the tunnel that underlies the river consists of an incline from the Liverpool side of about 900 feet, at a grade of 1 in 27; a mid-river section, nearly level, but graded both ways for drainage, of 2,000 feet; and an incline of 1,760 feet on the Birkenhead side, at a grade of 1 in 30. The steep inclines are continued in both directions to connect with various stations in the two cities. The tunnel proper has a width of 26 feet and a height above rail of 19 feet. At the stations this is increased to 56 feet 6 inches span, and 32 feet in height, with ample platforms and provision for light and air.

The work was nominally begun soon after the enabling act of Parliament in 1871, but it was not energetically pushed until 1879. Since that time 3,000 men have been kept constantly at work, and no death has occurred for which the contractors have been held responsible. On Jan. 17, 1884, the workmen from Lancashire and Cheshire shook hands under the river-bed.

The Beaumont boring-machine, which scoops out a tunnel seven feet in diameter, was used for the preliminary headings throughout.

Mr. James Brunlees and Mr. C. Douglass Fox were the engineers in charge of the entire work.

The Severn Railway-Tunnel.—Work was begun on this tunnel in March, 1873, by the Great Western Company, and, but for engineering difficulties of a character that could not be foreseen, it would have been completed long before the similar but far less formidable work on the Mersey. It was opened for traffic September 1. At Port Skewett the tidal estuary of the Severn is $2\frac{1}{4}$ miles wide, and the mid-channel depth is 100 feet at high water. The crown of the tunnel is carried 45 feet below the river-bed. From the deepest point the tunnel slopes upward at an incline of 1 in 100 toward the English terminus, and 1 in 90 toward the Welsh terminus. The total length of actual tunnel is about $4\frac{1}{4}$ miles, and at either end are deep cuttings 3,500 yards long. Drainage of more than $6\frac{1}{2}$ miles has to be provided for by pumping power. The geological formation is mainly marls, sandstones and shales with highly inclined coal strata and a very difficult conglomerate of pebbles and boulders. In October, 1879, the original headings had been carried to within 130 yards of junction under the river when a large inflow of water, known as the "big spring," took place on the headway on the Welsh side of the river and filled the works. Simultaneously the wells in the neighborhood ceased to flow, and the river Neddern ran dry. The pumps were of course unable to deal with such a volume of water, and a diver named Lambert

daringly undertook to close a door in the drift-way 330 yards from the shaft. The distance was too great for the ordinary appliances of air-pipes, and for 85 minutes he was entirely cut off from any communication with the surface. He closed the door, and subsequently other openings were closed, so that eventually the spring was confined, upon which the wells and streams resumed their natural flow. Another rush of water occurred on the English side under the river, but this was stopped by puddling with clay. The danger from water was never lacking, and several other serious disasters of this kind were only prevented by watchfulness. In spite of all vigilance another bad break occurred, and 27,000 gallons per minute burst into the tunnel. The doors provided for such emergencies were closed by Lambert, with less danger this time, since the distance was only 150 yards from the shaft, and air-pipe communication could be maintained. The dimensions of the main tunnel are 26 feet wide and 20 feet from rails to crown. The invert arch has a radius of 21 feet 6 inches. Frequent recesses are provided for workmen and tools. The brick-work was largely constructed from bricks made on the spot by the contractor from clay found in course of excavation. The product resembled the blue brick of Staffordshire. The great length of the tunnel necessitates no less than fourteen shafts for pumping and ventilation, and powerful fans are provided to accelerate the air-movement. The engineers in charge of the work were Sir John Hawkshaw and Mr. Charles Richardson, and the contractor since the outbreak of the big spring was Mr. T. A. Walker, of Westminster. The total cost of the tunnel and its accessories was not far from \$10,000,000.

Big Bend Tunnel.—Feather river, California, has afforded, since the early mining days, a rich field for gold-seekers, and the accessible parts of its bed and banks have been pretty thoroughly worked over, with generally remunerative results. In Butte County, however, the river runs through a wild cañon, following a semicircular course for fourteen miles, the current being so swift and the banks so precipitous that prospectors have been able to sample the deposits only under especially favorable conditions. The result of these casual examinations indicated that the whole bend was rich in gold, and surveys made in 1882 showed that a tunnel 12,000 feet long would carry the water of the river from a point above Big Bend to Dark Cañon, down which they would flow, and rejoin Feather river some distance below the bend. This would of course open the river-bed for mining operations. Work was begun in November, 1882, and the tunnel, with a cross-sectional area of 160 square feet, was practically finished in April, 1886. The heading was begun at the lower end and run upward at a grade of 29·7 feet to the mile to within 300 feet of the upper end when the remaining dis-

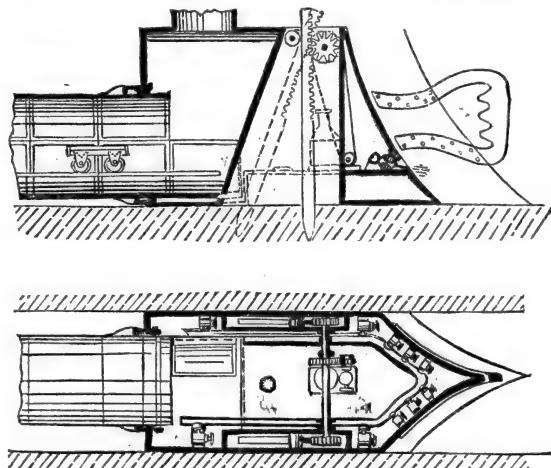

tance was utilized for a steep grade to secure a high velocity for the incoming current. As was anticipated, timber-work was nowhere required, the whole mountain being solid rock, mostly slate, with occasional stringers of quartz and granite, and about 200 feet of very hard dorite. In several places gold-bearing rock was penetrated, yielding \$8 to \$14 per ton. By the end of 1883, nearly 4,000 feet had been finished, and the monthly average varied from 300 to 400 feet, according to the quality of the rock. During the greater part of the time three shifts of 12 men were employed, each working 8 hours. Each shift comprised 1 foreman, 4 drill-men, 4 assistant drill-men, 1 powderman, 1 car-man, and 2 laborers. The permanent outside force consisted of 2 blacksmiths, 2 helpers, 2 engineers, and a number of laborers varying with the requirements of the work. The original plant was a No. 4 Burleigh air-compressor, driven either by steam or water; an air-tank, 4 by 16 feet; a No. 3 Knowles pump; a 2 by 8 Llewellyn heater; an 8-foot Knight water-wheel; a Buffalo drill-carriage, mounting 4 drills, and a tubular boiler 5 by 16 feet. Subsequently there were added 4 Burleigh tunnel-drills, a No. 4 Clayton duplex air-compressor, and a No. 5 Baker blower and engine to run it. The water-power was brought from Dark Cañon through a 11-inch iron pipe, having a vertical fall of 275 feet. The blower was used exclusively to draw smoke and bad air out of the near advanced heading through a pipe, while the air-compressor delivered fresh air in the face of the heading. The two machines were set to work about fifteen minutes before each blast, and kept running until the *débris* was cleared away and the drills again set in motion, when the compressed air used for driving the drills afforded enough fresh air. A two-foot track was laid through the tunnel and the *débris* hauled out by mules. It was estimated that this tunnel would carry the whole volume of Feather river during nine months of the year, but experience showed that it was not large enough to do all that was expected of it. During the progress of the tunnel, extensive preparations were made for working the river-bed and bringing supplies from Oroville; a dam was built at the head of the tunnel, and roads cut along the river-bank and over the mountain wherever needed. The unexpected surplus of water interfered somewhat with working the river-bed, but rich deposits of gold were found wherever the hydraulic engines could be set to work.

Tunnel at Stockholm.—The capital of Sweden is divided in its most populous part by a ridge of rock and gravel about seventy feet high and nearly eight hundred feet wide. Capt. Lindmark several years ago obtained permission to tunnel this hill for the use of foot-passengers, he to levy a charge of two ore (about half a cent) per passenger, for fifty years; the tunnel after that to revert to the municipality. The project was strenuously opposed by owners of

adjacent property and by engineers, who pronounced it impracticable on account of the nature of the soil. Permission was at last granted, and work begun at both sides of the ridge in 1884. No difficulties of an unusual nature were encountered until the western heading having had advanced about forty feet, when a subsidence occurred of such serious character that work was suspended, and Capt. Lindmark decided to freeze the earth before excavating further. A Lightfoot dry-air refrigerator was procured from London and placed in the advanced heading which was temporarily converted into a freezing-chamber by means of board partitions packed with charcoal. In September, 1885, the machine was set in motion, and in sixty hours the gravel was a mass of ice varying from five feet in thickness at the bottom to one foot at the crown of the tunnel. At the floor of the tunnel the temperature was readily kept at -40° , but barely touched $+32^{\circ}$ at the crown of the tunnel. This, however, was hardly an inconvenience, for the roof must have been planked in any event, in preparation for brick-work. The precautionary measure of erecting an iron safety-wall was soon dispensed with, and the gravel was so solidly frozen that it had to be quarried with special tools. During average weather the freezing-machine had to be run ten or twelve hours every night. In very rainy weather a longer time was necessary. The machine was capable of delivering 25,000 cubic feet of air per hour at a temperature of -67° . About eighty feet of the tunnel were driven with the aid of the refrigerating process, at the rate of about one foot a day. During the progress of the work one house settled a little, but no permanent damage resulted. The tunnel was opened for public traffic on June 1.

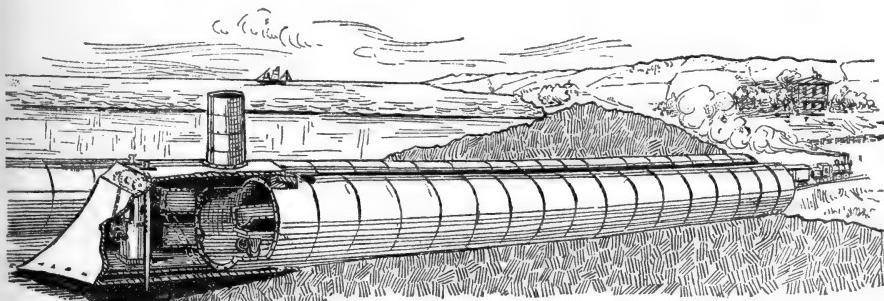

Submarine Tunnels.—Within a few years the demand for tunnels of this character has largely increased, not only for carrying railways

under rivers and estuaries, but for drawing supplies of fresh water for cities from large lakes. The invention here described offers a possible solution for many of the most important projects of modern engineering, such as the tunneling of the Straits of Dover and Northumberland, and for the more perfect water-

ELEVATION AND PLAN OF HEADWORKS, SUBMARINE TUNNEL.

supply of cities like Chicago, Racine, Milwaukee, and other towns situated near large bodies of fresh water. The illustrations sufficiently indicate the general principles that govern the construction. The head-works consist of a water-tight, plow-shaped caisson connected by a stuffing-box with the tube to be laid, and pushed forward by hydraulic jacks set against the end of the tube. As the tube is finished, a track is laid within it, and the segments are carried forward as required and bolted together in the caisson, where there is plenty of room to work the usual appliances for handling heavy weights. As each segment is bolted on, the jacks are set against its forward edge, and, when the ring is complete, the caisson is shoved forward in a trench, dredged out in

SUBMARINE TUNNEL IN COURSE OF CONSTRUCTION.

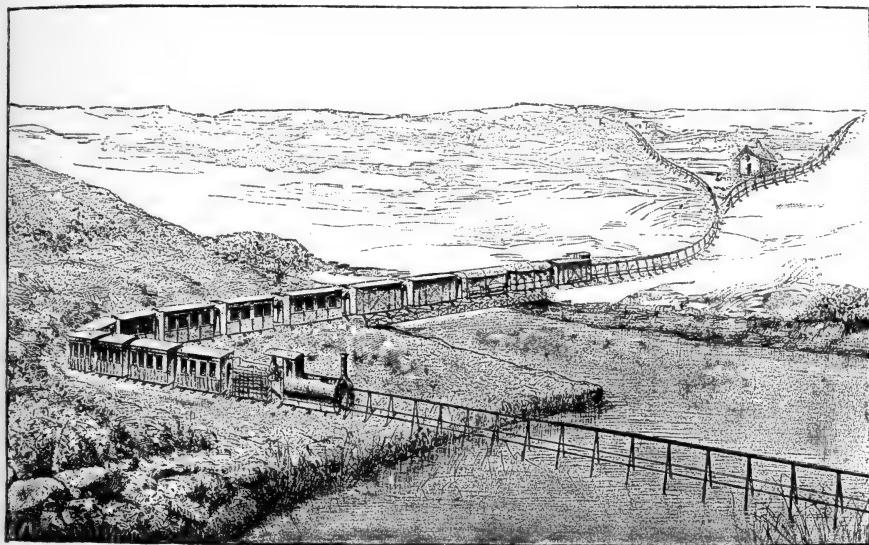

front of it. In very loose ground jets of water under high pressure can be thrown out to loosen the ground in front of the caisson. The direction in which the caisson is moved is under perfect control, and all the parts are loaded so as to overcome the buoyancy. The work may be prosecuted without reference to the weather as soon as deep water is reached. If the tunnel is intended for a water-supply, the caisson may be fitted with interior filters and gates, and left in position to serve as a permanent head-works for the tunnel.

The Poetsch Method of Mining.—An ingenious method of overcoming the difficulties incident to sinking shafts or driving galleries through excessively watery soils has been invented by Mr. Poetsch, a German engineer, and has been successfully used in several instances, notably in the Stockholm tunnel, mentioned elsewhere, and in the Konigs Wusterhausen mine, near Berlin. The method consists in freezing the semi-liquid earth so that it can be excavated by ordinary methods, and without the need of pumping. The congelation is effected by sinking a number of sheet-iron pipes eight and a half inches in diameter, so that they surround the intended shaft at intervals of about five feet. The holes for these pipes are bored or digged, according to circumstances. When in position the lower end of the pipe is hermetically sealed by lowering leaden plugs and pouring cement on top of them. This done, small central tubes are introduced, having openings near the lower end. Into the upper ends of these interior tubes the freezing mixture is poured. It finds its way out through the openings referred to, and ascends through the annular space between the tube and pipe. The liquid becomes heated in its passage at the expense of the surrounding earth, and, after a time, provided the difference of temperatures be sufficient, the pipe becomes incased with a cylinder solidly frozen earth, which gradually increases in diameter until it unites with the frozen cylinder of the next pipe. Thus is formed a frozen wall surrounding the space to be excavated. By waiting long enough, this space may be wholly solidified, but it is more economical to begin work as soon as the separate columns of frozen earth are solidly united. This union occurs first at the lower ends of the pipes, and ascends with greater or less rapidity till it approaches the surface of the ground. Mr. Poetsch used the chlorides of magnesium and of calcium, which latter is cheaper. The solution contains 19 per cent. of the salt, and has a density of 1·17, with a specific heat of 0·9. Under these circumstances it solidifies at about -40° . After passing through the tubes the fluid is conducted to a refrigerating-machine, where it is relieved of the heat absorbed in passing through the earth, and is again ready to repeat the freezing process (see ICE, ARTIFICIAL). Mr. Poetsch has used the Carré machine, which utilizes the affinity of water for ammonia, and

induces a temperature of -25° to -30° . A circulating pump is necessary, with a forcing arrangement, to keep the fluid in circulation, through a system of pipes. The shaft is lined with well-seasoned timber as fast as the work proceeds, so as to relieve the ice-wall from all avoidable strain.

Draining the Plesk Marshes.—About midway between the Baltic Sea and the Black Sea the best maps show a tract of uninhabitable marsh-land, lying on both sides of the Pripet river, a branch of the Dnieper, and crossed by other smaller streams. The area of this marsh is about equal to that of the State of Pennsylvania, and until recently it has been a safe harbor of refuge for many an outlaw. In 1870 the Government, after careful surveys, began the work of reclamation. A large force of engineers and a detail of several thousand troops were sent to the borders of the swamp, and have been at work ever since sinking wells, building bridges, constructing dikes, and reducing the forest-jungle so that hereafter it can be regularly cut over as are all the preserved forests of Europe. About 4,500,000 acres had been reclaimed at the end of 1886. Of this 240,000 acres are excellent meadow-land, 901,966 acres are semi-arable woodland, 499,179 acres of wild forest are accessible through navigable canals, and 2,009,036 acres are good arable land, of which, however, only a small proportion (123,577 acres) are as yet under cultivation. In addition to a large number of canals, drains, and embankments, 179 bridges were built, 572 wells were sunk, varying in depth from 20 feet to 100 feet. This is one of the most praiseworthy feats of engineering ever undertaken by the Russian or any other Government, and is a peaceful victory for which even nihilism should give credit. After the work is finished it should take but a few years to convert the whole region into a prosperous farming district, not to be distinguished from other communes bordering the sources of the Dnieper.

Lartigue's Single Railway.—The general plan of this very simple and economical railway is indicated in the illustration. The unit of construction is an A-shaped frame of angle-iron. A series of these is set up with the legs bolted to sleepers and connected with each other by side-rails and a top-rail, which latter sustains the principal wear and tear of service. The rolling-stock is made to ride upon this structure like a saddle, the main wheels resting upon the top-rail, while side-wheels bearing upon the connecting side-rails prevent undue oscillation or tilting. Single railways are no new thing. Other systems have preceded Lartigue's, notably M. Haddon's; but Lartigue's combines many practical improvements in details, and seems to have reached a limit of economy, and, as it has certainly demonstrated, a high efficiency. In September, 1886, an experimental line was erected in London. In this country none is as yet in operation. Before describing the appliances more in detail,

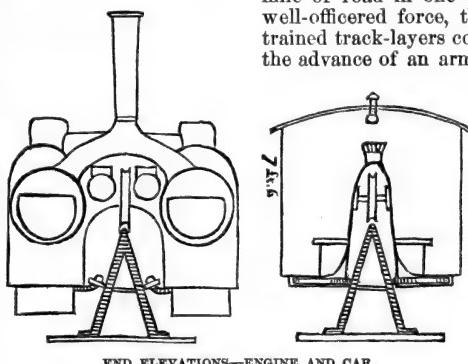

THE LARTIGUE RAILWAY.

it may be well to state what the system has actually accomplished. At the Ria mines, in the Pyrénées-Orientales, there is a line nearly seven miles long over which iron-ore is transported by means of a Siemens motor. The loaded trains in running down generate enough electricity to haul the empty trains up. In Algeria a line more than sixty miles long is in successful operation, and another similar line is authorized in the same neighborhood. These lines are intended to meet the requirements of the esparto-grass industry, and are peculiarly adapted to it, since, when one region has been stripped of esparto, the line can readily be shifted to another. In Russia numerous experiments were made at the camp of the Imperial Guard, near St. Petersburg, with the most satisfactory results. Special rolling-stock adapted for military purposes was used in these experiments. Cars were arranged carrying

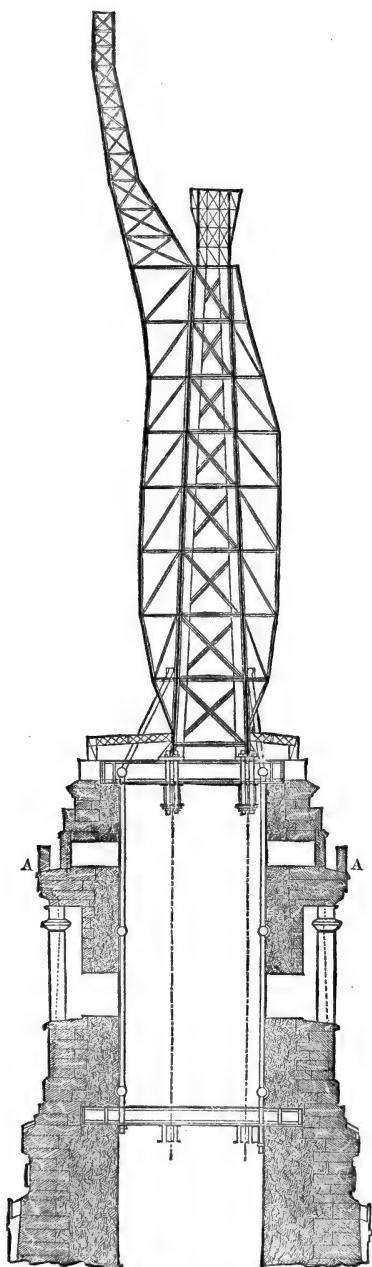

three men on each side of the trestle, and ambulances carrying two stretchers on each side. The line constructed in London is intended for suburban traffic, and it is understood that a similar line will be used at the Paris Exposition of 1889. The principal framework of the cars is a solid wrought-iron bar bent so as to

conform to the shape of the trestle, having due regard to the disposition of bearing and side wheels. This bar is further adapted to receive the flooring, seats, and other necessary appendages. The engine has two boilers, vertical or horizontal, one on each side of the trestle-rail. It ascends a grade of 1 in 10 with a train of several loaded cars, and without using the cogged drivers provided for very steep gradients. The advantages of this system of construction are many and obvious. In practice it was found that eight men could lay about a mile of road in one day. With a large and well-officered force, therefore, a battalion of trained track-layers could almost keep up with the advance of an army, or could at least establish communication with permanent railway lines within a few hours. The importance of such a readily established means of transportation for men and material in modern warfare can hardly be overestimated; but its importance as an auxiliary to permanent railways in time of peace is vastly greater.

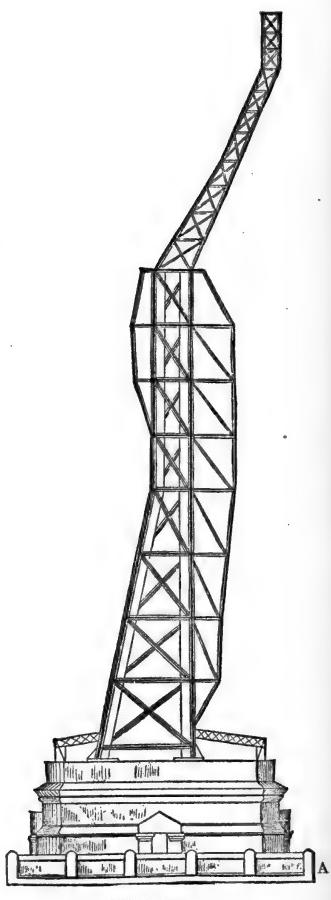

The ease with which it ascends steep gradients, turns sharp curves, and adapts itself to the ordinary irregularities of an average country, does away with a very large percentage of the expense attendant upon ordinary railway construction. It is not impeded by snow, nor is it likely to be interrupted by wash-outs. For mining pur-

poses or for lines connecting suburban districts with cities it appears to possess peculiar advantages. As has been intimated, either electricity or steam may be used for the motor; but even with mule- or horse-power the system is found to offer advantages over ordinary roads and tramways. Experiments have fixed the coefficient of adherence at one fifth with 14-inch driving-wheels. A locomotive weighing 2,200 pounds, therefore, exerts a tractive force of 440 pounds, and, considering the size of the drivers, this is no mean performance. With larger drivers the tractive efficiency might be indefinitely increased. With a steam pressure of 100 pounds to the square inch, such an engine will haul, at a speed of 6 miles an hour, about 70 tons on a level, 18 tons on an incline of 1 in 100, 9 tons on an incline of 1 in 50, and 6 tons on an incline of 1 in 33. With a lighter load a speed of 10 or 15 miles an hour may be safely attained, and with heavier rolling-stock and equipment, such as would naturally be used in actual service, a still higher speed and heavier loads can be handled.

Bartholdi's Statue of Liberty.—In its picture-sque aspects, this remarkable work of art is fully described elsewhere. Its construction, however, involves numerous problems that belong to the engineer rather than to the artist. The external contour of the figure, as it appears to the spectator, consists of copper plates about $\frac{1}{2}$ of an inch thick, and incapable of sustaining for a moment even the mere constant of gravity, not to mention the possible strains of wind-pressure from any direction. The stiffening framework was begun by lining each separate section of the statue with a network of iron bars ($\frac{3}{4}$ by 2 inches) bent so as to conform closely to the curves of the figure. These bars were fastened to the sections by copper bands, riveted in place, and from them, at thousands of points, the strains were distributed to the central supporting frame. The general form of the frame is shown in the two elevations (front and side given herewith). It consists of four heavy corner-posts of angle-iron, joined by horizontal angle-pieces, which divide it into panels, further strengthened by diagonal braces and by struts which are extended so as to approximate more closely the contour of the figure. The extensions, again, are united by braces and girders, and, on one side of the figure, are carried up into what may be termed a "flying truss," to support the arm and torch. In this arm-truss, it will be seen, the panels become smaller and the bracing correspondingly lighter. The whole of the frame was designed and put together in Paris by the consulting engineer, M. Eiffel. It was taken apart and shipped to America after having sustained the required tests.

The engineering work connected with the base and pedestal was intrusted to the late Gen. C. P. Stone, formerly an officer of the U. S. Ordnance Corps. The architectural design of the pedestal was furnished by Richard M. Hunt.

The site of the statue is Bedlow's Island, the property of the United States Government, and occupied by a star-fort with barracks, built early in the century, and constructed in the most durable manner. Part of the parapet was temporarily removed to make room for a tramway leading up from the wharf. The terre-plein of the fort was excavated to the natural soil of stiff clay, gravel, and boulders, and upon this was built up a solid block of concrete, probably the largest in the world. It is 90 feet square at base, 65 feet at top, and is 52 feet 10 inches high. There is a central well-hole 10 feet square leading to four divergent archways at the extreme base. Surrounding the base is a concrete arch 3 feet 6 inches thick, and having a cord-span of 49 feet. This arch supports the ornamental exterior slope of grass and the four flights of steps leading to the terrace which forms the top of the concrete, and upon which rests the massive masonry of the pedestal proper. The vertical section and plan in the diagram show the essentials of construction. The pedestal is a stone tower 43 feet 6 inches square at top, with the corners cut off to form an octagon. The central shaft, 26 feet 6 inches square, descends to the terrace, and contains the anchorage-works that hold the statue in position. At about 25 feet from the terrace a system of plate girders, 41 feet long, is built into the masonry. The girders are 4 feet deep, and made of $\frac{5}{8}$ -inch web-plate and heavy angle-irons. At the top of the pedestal is a second similar system of girders, 34 feet long, extending across the well-hole. The two systems of girders are joined by four sets of eye-bars each composed of four bars $1\frac{1}{2}$ by 4 inches. They are carried close to the masonry, and incline inward when they clear the top of the pedestal, joining the central frame of the statue at the junction of the first and second panels. Since the completion of the statue it has borne wind-storms of great violence, and from opposite directions, the velocity of the wind registering as high as 75 miles an hour, with an attendant pressure of not far from 15 pounds per square foot of surface. Under such conditions the oscillation even of solid masonry is plainly perceptible, and of course that of comparatively yielding metal must be at least as great. In point of fact, it was rather less than had been anticipated by the engineers. The statue is far greater than any in the world of composite construction. In India larger figures exist, hewed from solid rock, in place, and not to be considered in any sense as engineering work. The total weight of the Liberty Statue is 440,920 pounds, of which 176,368 are copper, and the rest iron and steel.

ENVELOPES. See PAPER BAGS AND ENVELOPES.

EVENTS OF 1886. In the United States, the labor troubles were the most important and significant events of the year. They involved not only the interests of capital and labor, but

made it necessary in several instances to call out the State militia in different sections of the country, and at one time the General Government was obliged to furnish regular troops to escort the mails. In politics, too, the labor organizations have developed unprecedented strength, polling in New York city alone more than 68,000 votes for their favorite candidate. A special paper on the strikes of the year will be found in its proper place. In Europe, too, the labor agitation, combined, as in America, with threatenings of socialism and anarchy, has held a marked prominence in the history of the times. The abduction and forced abdication of Prince Alexander of Bulgaria, and the consequent complication of affairs in the Balkan states, point to the need of wiser diplomacy on the part of the European powers than has thus far obtained. In France, the expulsion of the Orleans princes was one of the most conspicuous incidents of the year. In England the defeat of Mr. Gladstone in a direct appeal to the people on the test question of the Irish land bill was the most important political event. The United States experienced the severest earthquake-shock that has occurred since the settlement of the country, and they were visited by an unusual number of violent storms. The list of events that follows affords a journal of the world's history during the year, omitting "Disasters," which will be found under that heading:

January 1. David B. Hill (Democrat) inaugurated Governor of New York at Albany, and Fitz-Hugh Lee (Democrat) Governor of Virginia at Richmond. Annexation of Burmah, and proposed cession to China of the upper part of the province, announced by the British Government. Revolutionary disturbances in Spain; the revolutionists attempt to destroy a railway-bride, but are prevented, and some of them captured. Revolutionists gain control of the city of Matamoros, Mexico.

2. The Council of the Cherokee nation passes resolutions denying the jurisdiction of the United States over Cherokee lands. Bulgaria and Eastern Roumania agree to form a union.

4. Celebration at Berlin of the twenty-fifth anniversary of the accession of William III to the throne of Prussia. Women vote for the first time in Toronto, Canada. Greece protests against the union of Bulgaria and Roumania. Riotous proceedings in the Congress at Santiago de Chili.

5. Congress reassembles after the holiday recess; 790 bills introduced in the lower House. Great damages by flood throughout the northern tier of the United States. The Supreme Court of Connecticut decides that students of Yale College, resident in New Haven only as such, are not entitled to vote. Edmund L. Pitts chosen President of the New York State Senate and Gen. James W. Husted Speaker of the State Assembly. Hostilities between Orangemen and Catholics at Conception Bay, Newfoundland. Treaty of peace ratified between the French in Madagascar and the native tribes with whom they have been at war.

6. A native claimant of the Burmese throne threatens the English forces at Mandalay. Forty alleged Nihilists arrested in Russia.

7. A new French Cabinet announced with M. de Freycinet as President of the Council. In the House of Representatives Speaker Carlisle announces the committees.

8. New York Board of Aldermen of 1884 are charged

with having granted a charter to the Broadway Street Railroad in consideration of \$300,000, equally divided among them. A French missionary and 500 native Christians massacred in Annam. The Utah bill passed by the Senate. A meeting of 5,000 unemployed persons in Glasgow, Scotland. No Socialistic measures proposed. It was determined to petition the wealthier classes to devise methods of relief. Russia refuses to guarantee the independence of a union between Bulgaria and Eastern Roumania.

9. The Jesuits are expelled from Monaco.

10. Servia, Bulgaria, and Greece are required to disarm by the European powers, with the understanding that Turkey shall do likewise. Spanish protocol signed regarding the occupation of the Caroline Islands.

11. At a meeting of Irish Nationalists in Dublin it was resolved to continue the struggle for the rights of Ireland. German man-of-war "Albatross" occupies the principal port of the Samoan Islands. The German Emperor signs spirits monopoly bill. Spanish republican rebels seize one of the forts at Cartagena, and make their escape when threatened by troops. John B. Foraker inaugurated Governor of Ohio.

13. John Sherman re-elected United States Senator from Ohio. M. Floquet re-elected President of the French Chamber of Deputies. Burmese natives in strong force threaten to attack the British at Mandalay. Nine Democrats representing Hamilton county, Ohio, in the Ohio House of Representatives, adjudged to have been illegally elected, and nine Republicans installed in their places. British Parliament opens. Prussian Diet opens. Capt. John G. Walker, U. S. N., is confirmed by the Senate as chief of the Bureau of Navigation. Appointments confirmed of more than 150 postmasters.

14. The Bavarian Cabinet resigns.

15. President Grévy signs a decree granting amnesty to persons convicted of political offenses against France since 1870. Water-famine in Cleveland, Ohio.

18. Judicial salary bill passed by the Senate.

19. An alleged murderer lynched by masked men in Indiana. Irish Land League meets in Dublin. The presidential succession bill as proposed by Senator Hoar, of Massachusetts, having passed the House, January 15, is signed by the President. Cigar-makers in New York to the number of 8,000 refuse to accept a new pay schedule, and are locked out by the manufacturers.

20. Official opening of the Mersey river tunnel, connecting Liverpool and Birkenhead, England.

21. Capt. Emmet Crawford, U. S. A., while pursuing a band of Apache Indians, is killed in an encounter with Mexicans.

25. Gen. Barillas elected President of Guatemala.

26. In the British House of Commons the Salisbury Government suffers defeat. Annual convention of the National Guard of New York State.

27. New York State Senate orders inquiry into the Broadway Railroad franchise. Resignation of British Cabinet.

28. Exposure of the Pan Electric scandal.

30. Supreme Court of New York decides that the projectors of the Broadway Railroad Company must stand examination. Schaefer beats Vigneaux in contest for billiard championship.

31. M. Grévy, President of the French Republic, enters upon his second term of seven years.

February 8. New British ministry announced, with Mr. Gladstone as Premier.

4. Strike for twelve hours a day on several of the principal railroads in New York city; demands of the strikers ultimately granted.

6. Senate investigation of the Broadway franchise begins. Cholera at Tarifa, Spain.

8. Socialist disturbances in London, with rioting in Trafalgar Square; demonstrations continue several days. Anti-Chinese agitation in Alaska.

10. Spanish Republic; its thirteenth anniversary celebrated at Madrid.

17. New Jersey Senate passes a bill to prevent the bridging of Arthur Kill by the Baltimore and Ohio Railway. New York Superior Court restrains transfer of Broadway Railway stock to Philadelphians.

18. Bismarck's spirit monopoly bill passes the Bundesrath.

20. Strike of the Pennsylvania coke-workers ends in favor of the workmen.

21. A Chinese mandarin traveling on business is refused permission to land in San Francisco, and is sent back to China.

22. Balkan Peace Conference adjourned.

28. Servia refuses to sign a treaty of peace with Bulgaria.

March 1. Rioting in Chicago in consequence of labor troubles in the McCormick Reaper-Works.

2. Strikes on the Texas Pacific Railroad and on street-railways in New York city.

3. Brig.-Gen. A. H. Terry, U. S. A., is promoted in place of Maj.-Gen. Hancock, deceased. Pope Leo XIII celebrates his seventy-fifth birthday, and the eighth anniversary of his coronation.

5. Greece calls out her reserves in expectation of war with Turkey. Strike of the New York street-railways ends practically in favor of the men. A motion denouncing the House of Lords is defeated in the House of Commons by a vote of 202 to 106.

6. General strike inaugurated on the "Gould system" of Southwestern railroads; several lines blockaded.

10. General lockout of knit-goods manufacturers at Cohoes, N. Y. A committee from the United States Senate investigates the Pan-Electric scandal. Strike of coal-miners in Pennsylvania.

14. Great Socialistic meeting in Glasgow, Scotland.

15. Mr. Gladstone announces his plan for the better government of Ireland. Morgan art collection, including the famous "peach-blow vase," sold in New York for \$1,207,052.

16. New York city aldermen enjoined by Judge Lawrence from passing over the mayor's veto a bill authorizing the wholesale construction of cable-railways in New York city. W. L. Trenholm nominated for Comptroller of the Currency in New York State.

17. Electoral count bill passes the Senate. Both houses pass bill granting a pension of \$2,000 to the widow of Gen. Hancock. Treaty of peace ratified between Servia and Bulgaria.

18. Henry W. Jaehne is arrested for complicity in the Broadway Railroad case. Prince Alexander confirmed by all the European powers except Russia as Governor for life of Eastern Roumelia.

20. American fishermen off Canadian coast warned not to transgress the Treaty of 1818.

21. Geronimo, chief of the Apaches, surrenders to United States troops under Lieut. M. P. Maus.

22. Strike becomes general on the Western rail-ways. Ex-Alderman Jaehne indicted for bribery and imprisoned. Troops are called out to suppress Anarchist riots in Belgium.

23. Twelve locomotive-engines disabled by strikers at Kansas City, Mo.

24. Rioting at St. Louis, Mo.

26. United States troops sent to St. Louis and elsewhere to protect mails in transit against rioters.

27. Many Anarchist rioters killed in an encounter with troops in Belgium. The Hon. James Stansfield and the Earl of Dalhousie appointed to the Cabinet of Great Britain in place of Messrs. Chamberlain and Trevelyan, resigned. A bill establishing a Government monopoly for the manufacture of distilled spirits, proposed by Prince Bismarck, rejected by the German Reichstag, 183 to 3.

29. Mineral oil discovered in Louisiana.

30. Two trains wrecked by strikers on Missouri Pacific Railway.

31. The German Anti-Socialist law, about to expire by limitation, is prolonged for two years by the Reichstag, 173 to 146. Strikers ordered back to work

by officers of Knights of Labor. Geronimo escapes from his guard. Gen. Carceres elected President of Peru.

April 1. Railway strike renewed because the railroads refused to take back all the strikers. Belgian revolutionists resume their demonstrations. The Senate votes \$500,000 for a monument to Lincoln to be erected in Washington.

2. Ex-Alderman Waite makes a confession in regard to the Broadway Railroad case.

3. The House passes a labor arbitration bill.

4. Texas militia defeat railroad strikers.

5. The House votes \$550,000 for a Congressional Library building and the Mexican War pension bill.

6. English university boat-race. Cambridge defeats Oxford.

7. George P. Wetmore re-elected Governor of Rhode Island, with the rest of the Republican ticket. A prohibition amendment to the State Constitution adopted by a popular vote. The lower house of the Prussian Landtag passes a bill expropriating Polish landholders in Posen and colonizing the province with Germans. The Senate rejects a bill to increase the United States Army to 30,000 men. Rioting in East St. Louis depots. Gen. Don Bernardo Soto elected President of Costa Rica. Political riot in Texas.

8. The House rejects the free coinage bill. The Italian ministry resigns. George Hearst appointed United States Senator from California in place of John F. Miller, deceased. Caleb W. West, of Kentucky, appointed Governor of Utah, in place of Eli H. Murray, resigned. Senate approves House Library appropriation bill of April 5. Central Labor Union resolves to boycott Jay Gould.

9. Conflict and loss of life between strikers and deputy-sheriffs in East St. Louis.

13. Wholesale arrests of the New York aldermen engaged in the Broadway Railroad bribery scheme.

14. Knights of Labor declare war against the Gould system.

16. Strike on Third Avenue Railway, New York city. Mr. Gladstone's Irish land bill proposed in House of Commons.

18. The Bishop of Madrid is assassinated by a deposed priest.

19. Strikes on nearly all the New York city rail-roads. Conflicts with the police.

20. End of New York street-car strikes except on Third Avenue.

21. Greece is notified by the European powers that she must disarm. Grand Army of the Republic holds its twentieth annual encampment in New York. Broadway Railroad charter annulled by the State Legislature.

22. Seven indictments against bribers of the New York aldermen. Strike ends at Chicago. The President recommends the creation of a commission of labor to consider and settle, when possible, all conflicts between labor and capital. Mr. Gladstone's Irish land-purchase bill is published.

23. Church of San Luis, at Madrid, blown up.

28. Comet discovered in Cassiopeia.

29. Greece declines to accede to the demand of the powers (April 21). Volcanic eruption in Java.

May 1. Strike for eight-hour system in the Northwest. Partial success of strikers. Great labor demonstration in Union Square, New York.

3. Knights of Labor declare the strikes against the Gould system at an end. Bloody conflict between strikers and police in Chicago.

4. Anarchist riots in Chicago. Dynamite used by rioters, killing six policemen and wounding sixty-one. Many rioters killed. Burmese insurgents burn a large part of the city of Mandalay. Opening of the Indian and Colonial Exhibition in London.

5. Anarchist riots in Milwaukee. River and harbor bill, appropriating \$15,000,000, passed by the House.

6. Greece withdraws her ambassador from Turkey.

7. American schooner David J. Adams seized by the authorities of Nova Scotia for alleged infraction of Canadian fishing laws.
9. The fleets of the European powers blockade the Greek coast.
10. Trial of ex-Alderman Jaehne begins in New York.
12. A new Greek Cabinet is formed. Spanish senatorial elections result in a ministerial victory.
16. Ex-Alderman Jaehne found guilty of bribery.
17. American schooner Ella M. Doughty seized by Canadian authorities for alleged violation of fishery laws. An heir born for the Spanish throne.
18. Archbishop Gibbons, of Baltimore, is made a cardinal. Cincinnati musical festival opened.
19. Pension bill passed.
21. Fighting between Greeks and Turks.
22. Marriage of the Crown-prince of Portugal and Princess Marie Amélie of Orleans.
25. Knights of Labor meet in general assembly at Cleveland, Ohio.
26. Cornell University receives \$1,500,000 by will from Mrs. Prof. Fiske. Ormonde wins the Derby.
28. New gold-fields discovered in Australia.

June 1. Strike of Philadelphia carpenters. French flag hoisted in the New Hebrides.

2. Marriage of the President of the United States and Frances Folsom, of Buffalo, N. Y., in the Executive Mansion at Washington. Dundee made an open port for foreign cattle.

3. Gen. Carrereis inaugurated President of Peru. Yellow-fever epidemic at Colon. Buddenseik sentenced to ten years' imprisonment for building insecure houses.

4. Chinese indemnity bill passed by the Senate. Rioting in Belfast. Election in Oregon—Sylvester Pennoyer (Democrat) chosen Governor, with part of State ticket. Legislature Republican on joint ballot.

5. Street railroads of New York city stopped by order of the Knights of Labor.

7. In the House of Commons the Government is defeated on the Home-Rule bill (311 to 341). The House of Representatives modifies the pre-emption timber-culture and desert-land laws, and the homestead laws.

8. Nelson W. Aldrich re-elected U. S. Senator from Rhode Island.

10. More rioting in Belfast; fighting and bloodshed.

11. The French Chamber of Deputies by a vote of 315 to 232 passes the Princes Expulsion bill (*le projet de loi sur l'expulsion des princes*).

13. Ludwig II, King of Bavaria, commits suicide by drowning himself in Starnberg Lake, near the Berg Castle. His attending physician, Dr. Gudden, also drowned, probably in attempting to prevent the King's suicide.

18. Civil service is confirmed by the United States Senate. Mr. Vance's motion to repeal lost by a vote of 33 to 6. Mr. Frye's bill to encourage the American merchant marine and promote postal and commercial relations with foreign countries passes the Senate. An amendment to the Constitution of the United States, extending the President's term of office, passes the Senate by a two-thirds vote in the form of a joint resolution to be submitted to the people; also extending the session of the Fiftieth Congress to April 30, 1889, and substituting April 30 for March 4, for the beginning of presidential and congressional terms.

20. Funeral of Ludwig II, King of Bavaria, at Munich.

21. Extradition treaty with Japan ratified in the Senate. Resurvey of boundary between the United States and Mexico approved by the Senate. The Canadian Roman Catholic bishops forbid Catholics to join the Knights of Labor. Naval appropriation bill passes the House (\$12,930,034). Parsons, one of the indicted Chicago Anarchists, surrenders himself in court.

22. A new law in regard to imprisonment for debt goes into effect in New York, and many debtors are set free. An association of Socialists discovered in Ottawa. The French Chamber of Deputies passes a bill fixing an extra tax on cereals by a vote of 302 to 227—this in opposition to the wishes of the Government. Prince's expulsion bill passes the French Senate by vote of 141 to 107.

23. Decree of banishment issued in France against the hereditary princes Victor and Jerome Napoleon, and the Comte de Paris, all of whom soon departed, going respectively to Brussels, Switzerland, and England.

25. British Parliament prorogued, in order to test popular opinion on the Irish Home-Rule question. A proposition looking to a literary convention with England passed by the German Reichstag.

26. Adjournment of German Reichstag. Its last act was to reject Bismarck's brandy-tax bill. The French Chamber of Deputies rejected, by a vote of 242 to 216, a proposition to abolish the use of titles by the nobility.

28. Prince Luitpold declared Regent of Bavaria in place of the hereditary King Otto, who is mentally incapable of reigning.

29. An asteroid of the eleventh magnitude discovered by Dr. Peters at Hamilton College.

30. Canadian Pacific Railway opens for regular traffic. Pensions paid by the United States during the fiscal year ending this day, \$63,797,831.61, with 365,788 names on the rolls. Cuban autonomy declared by the Cortes incompatible with the established Government of Spain; a majority of 200 was cast in favor of this decision. Elections in Holland resulted in a Liberal gain, the Chamber now standing 47 Liberals and 39 anti-Liberals. Cardinal Gibbons is officially invested with the beretta at Baltimore.

July 1. Parliamentary elections begun in Great Britain. The President signs the bill restoring to Fitz-John Porter his rank of general in the army. Reunion of war veterans on the battle-field of Gettysburg.

2. Harvard-Yale boat-race at New London, Conn. Yale wins. Discovery of oil near Corry, Pa.

3. Naval appropriation bill passes the Senate reduced by \$46,500. Base-ball, Harvard-Yale match—Yale wins.

5. Portland, Me., celebrates its centennial.

6. Six boycotters in the Landgraf case convicted and sentenced in New York. More than 100 rioters wounded at Cardiff, Wales.

11. Niagara rapids (below the falls) passed by C. D. Graham in a cask constructed for the purpose.

12. International chess tournament in London.

14. Morrison resolution passed by the House. (See July 30.) New extradition treaty signed between United States and Great Britain.

15. Regatta of the American Steam Yacht Club; Larchmont to New London; winners in their respective classes, Atlanta, Lagonda, Nereid.

19. Bi-centennial celebration of the settlement of Albany, N. Y.; lasts several days. Fortifications bill (\$620,000) passed by House. (See July 28.)

20. Oleomargarine taxed two cents a pound by action of House (Senate concurs July 23).

21. Mr. Cutting, an American citizen, arrested in Mexico for an act done in the United States. Monsignor Tascherau installed Cardinal of the Roman Catholic Church at Quebec, Canada. Elections in Great Britain having resulted unfavorably to the Liberal party, Mr. Gladstone, the Premier, retires from office, and Lord Salisbury is appointed to succeed him. The elections in Great Britain returned to the House of Commons 316 Conservatives, 78 Union Liberals, 191 Gladstone Liberals, 85 Parnellites.

23. A boy purposely jumps from the East River Bridge in mid-stream, and is not injured—height 135 feet.

24. Blenheim collection of paintings sold in London.

26. Riots in Amsterdam, lasting two days; cause—prohibition of popular games on Sunday. Military called out; 20 killed, 80 wounded.
27. Court of Claims begins settlement of the Alabama depreciation cases.
28. Cigar-makers to the number of 3,500 locked out by manufacturers in New York. The Spanish Cortes passes a resolution recommending the liberation of the 26,000 slaves still held in Cuba. (See Oct. 27.) Rollin M. Squire, Commissioner of Public Works in New York city, arraigned by the mayor. Fortification bill passed by Senate.
30. Morrison resolution providing for disposing of the Treasury surplus passed by the Senate. Any surplus above \$100,000,000 to be used for the redemption of United States bonds, whenever such surplus exceeds \$10,000,000 (not signed by the President). Interstate commerce bill (Reagan's) passed by the House.
31. Alien landlords bill passed by House. Pensions to veterans wounded in arm, hand, leg, or foot, increased 25 per cent, by vote of the House.
- August 1.** Elections in France; 847 Republicans, 411 Conservatives returned; second elections required in 177 districts. An aerolite, weighing 90 pounds, fell near Sandusky, Ohio. Letter published showing that Street Commissioner Rollin M. Squire, of New York, made a corrupt political bargain with a contractor on the Croton Aqueduct. Mexico decides to try Cutting for an offense committed in the United States.
2. The University of Heidelberg celebrates its 500th anniversary. The President signs the oleomargarine tax-bill. Election in Alabama; Thomas Seay and the entire Democratic State ticket elected. New ships bill passed by the House. Secretary of State Bayard submits to Congress the correspondence in the Cutting case. Fitz-John Porter reinstated in the United States Army, with the rank of colonel, after twenty-two years under sentence of dismissal for disobedience of orders.
3. The new English ministry receive the seals of office; for list of the ministry, see GREAT BRITAIN. River and harbor bill adopted in joint conference. Snow fell in eastern New England. Grand Army of the Republic holds its annual national encampment in San Francisco. A. P. Williams (Republican) elected United States Senator from California.
4. Trial of Commissioner Squire begun in New York.
5. Gold discovered near Abington, Mass. Adjournment of Forty-ninth Congress at the end of its first session. Total number of bills and joint resolutions: House, 10,223; Senate, 2,974; passed, 987; bills, originating in the House, 746, and 241 in the Senate. The President vetoed 115 bills, mostly private pensions and public buildings; the total of the appropriations were \$264,733,579.
6. Cutting found guilty by a Mexican court, and sentenced to pay \$600 fine and suffer one year's imprisonment.
7. Riots in Belfast, Ireland, lasting three days, between the opponents and advocates of Home Rule; 18 killed, 130 injured.
8. Two men pass the Niagara whirlpool in a cask.
9. Collector of Customs Hedden, of New York, resigns.
10. Daniel Magone, of Malone, N. Y., is appointed collector of customs in New York city. Maurice B. Flynn and Commissioner Rollin M. Squire indicted for conspiracy in New York city. Lock-out of 4,000 factory operatives in Augusta, Ga.
12. Strike in Chicago stock-yards.
14. Gen. Sedgwick is sent to Mexico as a special envoy in the Cutting case.
15. New Anglo-Spanish treaty goes into effect.
16. Petroleum discovered in France.
19. Irish National League meets in Chicago. James C. Scott killed in an attempt to swim Niagara rapids in a cork jacket. Cholera epidemic in Italy.
20. Seven Chicago Anarchists found guilty of murder and sentenced to be hanged, and one to be imprisoned for life.
21. Prince Alexander, of Bulgaria, forced to abdicate by conspirators. W. J. Kendall survives the passage of Niagara rapids in a cork vest.
23. Exposition at Minneapolis opened, the machinery being set in motion by Mrs. Grover Cleveland by telegraph from the Adirondack woods in New York. Cutting released by the Mexican authorities because the plaintiff did not appear against him; Mexico offered no abatement of the law holding foreigners responsible for offenses committed outside of Mexican jurisdiction. Prince Alexander returns to Bulgaria, and is recrowned by the officers of the army.
25. Gen. John Newton, United States Engineer Corps, appointed Commissioner of Public Works in New York city.
29. Monster demonstration of Socialists in London; the police fail to disperse the crowd.
- September 1.** American schooner Everett Steele seized by the Canadian authorities for violation of the fishery laws.
4. Prince Alexander again forced to abdicate by the Czar of Russia. Geronimo's band of Apache Indians surrenders to Gen. Miles in Arizona.
6. Election in Arkansas; Democratic majority, 20,000.
7. Election in Vermont. Republican majority, 18,000. Bi-centennial of Woodstock, Conn. International yacht-race for the America's cup. Contestants: Mayflower (American), Galatea (British). The American boat wins (second race with same result, Sept. 11).
10. Irish land bill of Mr. Parnell read for the first time in the House of Commons. Natural gas discovered near Ellenville, N. Y.
13. English fishing-boats seized by French authorities. Election in Maine. Republican plurality, 13,000; Joseph R. Bowdoin chosen Governor.
15. Cholera epidemic in Austria.
18. Yacht-race off Newport, R. I. Winners in their respective classes: Sloops, Mayflower; schooners, Gitana; second-class sloops, Thetis; third-class sloops, Clara.
19. Knights Templar hold their triennial conclave in St. Louis.
20. The Mayor of Philadelphia impeached by the Common Council.
21. Irish land bill (Mr. Parnell's) defeated in the House of Commons (202 to 297). Strike of 90,000 cotton-spinners in England.
22. Labor riot at Peabody, Mass.
23. Henry George nominated for Mayor of New York by the Central Labor Union, and indorsed by 60,000 individual nominations sent by postal-card. Battle between the French and Chinese pirates near Hooloo, Tonquin; 500 pirates reported killed.
24. The Corporation of Cork, Ireland, refused an address of welcome to the Lord-Lieutenant.
30. Jefferson Davis publishes a letter charging Gen. Sherman with falsehood. Pleuro-pneumonia among cattle in Chicago; \$75,000 worth slaughtered. Plot frustrated to blow up the Russian Czar. Bulgaria refused Russia's ultimatum. Prussia and the Vatican sign an agreement regulating the management of ecclesiastical affairs within the kingdom.
- October 1.** The Third Avenue Elevated Railroad—the busiest in New York city—reduces its fares from 10 cents to 5 cents. American sloop Thetis beats English cutter Stranger in a race off Marblehead.
4. Knights of Labor hold their convention at Richmond, Va., and are addressed by Governor Lee. Silver certificates (\$1) issued by the United States Treasury.
5. English cutter Stranger beats American sloop Thetis in a race off Marblehead. Court of Appeals affirms the sentence of Alderman Jaehne.

6. General John B. Gordon, Democrat, chosen Governor of Georgia; no opposition.
 8. Chicago packing-houses announce a return to the working-day of ten hours. General strike of the employes ordered. Plot frustrated to assassinate the Emperor of Austria.
 9. Chicago Anarchists sentenced to be hanged. A new Spanish ministry formed.
 11. Wholesale arrests of Chicago Anarchists.
 12. Judge Wallace, of New York, affirmed the legality of city tax on national-bank shares.
 13. Mexico appropriates \$6,000,000 to drain the valley surrounding the capital.
 16. Protestant Episcopal Church holds its General Convention at Chicago; it refuses to drop the word "Protestant" from its official title.
 18. Strike at Chicago ends; pork-packers accept the ten-hour schedule. Arrest of Jacob Sharp and others for complicity in the Broadway Railroad bribery case in New York; bail, \$50,000.
 19. George F. Edmunds re-elected United States Senator from Vermont.
 21. The President visits the Agricultural Fair at Richmond, Va.
 23. Inman Steamship Line sold for \$1,000,000.
 25. Geronimo and 14 Apache warriors remanded to Fort Marion, St. Augustine, Fla. Brotherhood of Locomotive Engineers meet in New York city.
 26. Robbery of an express-car near St. Louis, Mo.; \$100,000 taken.
 27. Queen Christina of Spain signs a decree liberating the Cuban slaves. Yale College is formally declared to be a university by act of its corporation. King Otto of Bavaria officially declared insane. Bartholdi's Statue of Liberty Enlightening the World, on Bedlow's Island, New York Harbor, is unveiled, with due ceremony, in the presence of a delegation from France, including the artist and a great number of officials.
- November** 1. Louis Napoleon, one of the exiled French princes, visits Washington. The British Colonial Office forms a new province of the western part of Zululand.
 2. Elections held in California, Colorado, Connecticut, Delaware, Kansas, Massachusetts, Michigan, Minnesota, Nebraska, Nevada, New Hampshire, New Jersey, Pennsylvania, South Carolina, Tennessee, Texas, and Wisconsin. (For particulars, see special articles on the different States.) In New York city Abram S. Hewitt, Democrat, was chosen mayor, receiving 90,552 votes; Henry George, the Labor candidate, received 68,110; and Theodore Roosevelt, Republican, 60,435.
 3. Methodist Missionary Board appropriates \$1,050,000 for missions.
5. George W. Baxter appointed Governor of Wyoming Territory.
 7. Militia called out in Chicago.
 9. Riots in stock-yards in Chicago; mob dispersed by militia and detective officers.
 10. Waldemar, son of the King of Denmark, elected by acclamation Prince of Bulgaria; he declines the honor.
 11. Prince and Princess Komatsu of Japan sail for Europe. Government suit against the Bell Telephone Company dismissed.
 13. Strikers at Chicago ordered back to work by Master-Workman Powderly.
 15. Trial begins of Alderman McQuade for bribery in connection with the Broadway Railroad franchise.
 18. Colonel John Moore appointed Surgeon-General U. S. A.
 19. Fullgraff and Duffy, two of the accused aldermen in the Broadway Railroad case, make full confessions in court.
 24. The McQuade jury disagrees; new trial ordered. Ex-Gov. Person C. Cheney appointed United States Senator from New Hampshire, in place of A. F. Pike, deceased.
 25. Opening of the German Reichstag.

December 1. The Spanish Cortes unanimously votes a credit of \$45,000,000 to improve the navy.

3. French ministry resigns.
 4. New French ministry formed, with M. René Goblet at its head.
 6. Congress meets.
 9. Bulgaria, Servia, and Roumelia form an offensive and defensive alliance, with a joint army of 400,000 men.
 10. Rev. Dr. McGlynn, of New York, summoned to Rome to answer for his support of Henry George's theories. Coal discovered in Texas.
 13. Engagement between the British forces and the Burmese, near Mandalay; 200 natives killed.
 14. American schooner Highland Light condemned for violation of treaty, and sold at auction; she is bought in by the Dominion Government, and turned into a cruiser.
 15. Panic on the New York Stock Exchange. Ex-Alderman McQuade found guilty, and sentenced to seven years in State Prison and \$5,000 fine.
 16. House passes a bill allotting lands in severalty to Indians.
 18. Morrison tariff bill defeated in Congress.
 22. Lord Randolph Churchill resigns from the British Cabinet.
 23. Strike on city railroads, Brooklyn, N. Y.
 28. Hearing begun in the case of the Andover professors charged with heresy.

F

FAIR-TRADE LEAGUE, an organization that sprang into being in England after the depression in trade and the agricultural prostration that began in 1873. It was the result of the efforts of several members of Parliament, who made speeches and wrote pamphlets laying the existing economic disturbance to the account of free trade, and pressing a protectionist revival in the form of reciprocity, or retaliatory or countervailing duties. The matter was taken up by the land-owners and tenant-farmers, and the movement eventually took shape in the formation of this association. So great was the feeling aroused among the British public that the Conservatives, on their accession to power after the defeat of Mr. Gladstone's government,

were forced into appointing a royal commission to inquire into the causes of trade depression. This commission was composed chiefly of Conservatives, under the chairmanship of Lord Iddesleigh. Prominent members were the Earl of Dunraven, Selater-Booth, R. H. Inglis Palgrave, F. R. S., and Prof. Bonamy Price, and the commission held sittings, examined influential witnesses from the chief centers of commerce, and received reports and statements from chambers of commerce and boards of trade throughout the United Kingdom and the British colonies. The first report of the commission was issued Feb. 7, 1886, and contained the evidence of Messrs. Giffen, of the Board of Trade; C. M. Kennedy, head of the Commer-

cial Department of the Foreign Office; S. Sel-don, Principal of the Statistical Department of the Customs; R. P. Harding, chief receiver in bankruptcy; J. S. Purcell, Registrar of Joint-Stock Companies and Controller of Stamps; A. West, Chairman of the Board of Inland Revenue; J. A. Crowe, Commercial Attaché to her Majesty's Embassy at Paris; and D. E. Colnaghi, British consul-general at Florence. It also contained the replies sent by various chambers of commerce to inquiries as to the state of trade sent to them by the commission.

The Fair-Trade League and the fair-traders generally repudiate any desire to reinstitute the corn laws, or even to impose protective duties. What they aim at is reciprocity or retaliation, with a view to the ultimate establishment of free-trade among nations. With regard to the practical application of the reciprocity principle, the fair-traders propose a close federation between England and her colonies, and the establishment of internal free-trade throughout the empire, but with the imposition of retaliatory or countervailing duties on imports from other countries. The free-traders, in objection to this proposed policy, while admitting that foreign tariffs in many instances have operated injuriously to the British manufacturer, and that at the existing low price of food, resulting from the free-trade system, British farmers could not profitably compete with their foreign rivals, yet maintained that the fact of being able to obtain food and raw materials on the lowest terms gave them an enormous advantage over other countries, and enabled their manufacturers to compete with all comers in the neutral markets of the world. The free-traders also asserted that the great advantage of the application of their doctrine was proved by the fact that England was not only the greatest manufacturing power, but had secured for herself the bulk of the carrying-trade and the banking business of the world.

Lord Salisbury, in his speech at the Victoria Hall in November, 1885, though avowing himself a free-trader, and protesting against the taxing of food and raw materials, thought there could be no harm in trying the experiment of retaliatory duties upon manufactures. The free-traders show, however, that some manufactures are the raw materials of others. Again, the free-traders contend that protective tariffs increase the cost of production, and that, accordingly, protected countries not only can not compete with free-trade countries in neutral markets, but can only inflict partial injury by competing in free-trade markets; also that while particular industries are injured by the admission of foreign goods duty free, the community is benefited. As for the distress of agriculturists, it is contended that the remedy is not protection, which would simply send up rents and increase the price of everything except labor, but the removal of the

restrictions that are imposed under the existing land system.

FAITH-CURE, an alleged effect of perfect religious faith, which has come into prominence within the past three years. One of the instances sustaining the theory was reported from Connecticut in 1884. The narrative reads as follows: "Mrs. —— has for many years been a victim to the opium-habit and asthma. She is now fifty-five years old. Over forty years ago she suffered from an attack of ill-health, and her physician prescribed opium. She is of a nervous temperament. The use of the drug as a medicine developed an appetite for it, to which she gave way. She continued its use up to the time of her cure, five weeks ago. She was also a great snuff-taker, and in addition there was the asthmatic trouble, which the drug was used to relieve. All the local doctors agreed that an opium-habit of forty years' standing was an incurable disease. The quantity used had steadily grown larger, until she would consume half an ounce of the drug in a day. The asthmatic affection was serious and constant, and, of course, peculiarly distressing. She could not remain long in the room with three or four other persons. Life was a burden, and she looked for and expected no relief. Mrs. —— resented the suggestion of friends that a prayer-meeting for her recovery be held at her house, and told them she had no faith in the proposed plan. She plainly intimated that they had better mind their own business, and not meddle with her concerns. But she finally made the attempt to break off both the opium and the snuff habit by the means suggested. She prayed herself, and her friends prayed for her. The abrupt stoppage of the doses of opium, of course, resulted in a decided breaking up of the system, and very shortly Mrs. —— became quite ill. One day, about a week ago, two or three of Mrs. ——'s friends met at her residence, and a season of earnest prayer was determined upon. Prayers were offered and continued with earnestness by those present, and the invocations continued for some time. It was during this period that Mrs. —— says she experienced a peculiar sensation of mind and body unlike anything she had ever experienced before. She calls it the 'blessings of the Holy Spirit.' From that moment she dates her complete cure, and she and her friends declare she has not touched opium or snuff, nor has she felt any desire for them, and, what seems the most singular part of the cure, she has been entirely freed from the asthmatical trouble. She now declares herself in perfect health; her appetite is good, and her general appearance that of a person in good health. She attributes her cure entirely to prayer and faith." Other instances of a similar nature might be mentioned; but the above is a fair illustration of what is claimed by those who believe in the faith-cure. Special gifts of healing are also claimed for certain ministers and laymen who

appear to be able to effect cures. It is claimed for them that they are not bound to the old routine of evangelistic services; that they are real successors of the apostles in working cures; that they are simply obeying the command of Christ: "As ye go, preach, saying the kingdom of heaven is at hand. Heal the sick, cleanse the lepers, raise the dead. Freely ye have received, freely give"; that they are also fulfilling the words of the Apostle James: "Is any sick among you? let him call the elders (or priests) of the church; and let them pray over him, anointing him with oil in the name of the Lord; and the prayer of faith shall save the sick, and the Lord shall raise him up." The words of St. Paul are also quoted: "God hath set some in the church; first apostles, secondarily prophets, thirdly teachers, after that miracles, then gifts of healings, helps, governments." Conferences, or conventions, have been held by those who claim that they have been cured by the power of faith. One of the chief of these conferences was held in Pittsburg, Pa., in November, 1885. As declared at the time, the object of the conference was, "to gather together Christians of common faith and spirit for mutual fellowship and encouragement in life and testimony; to study the Word of God, and learn to know better his message and testimony to his people, and the testimony he expects from his people for this day and time; to promote the deeper spiritual life among Christians, and help all who are seeking such a life to enter into complete union with Jesus Christ as their life, sanctification, and victory over the world, self, and sin; to seek to understand better the teachings of the Scriptures respecting our physical life in Christ, and confer regarding his word and his mighty work respecting divine healing, and to enable those who will to receive him as their healer; to wait upon the Lord for a special baptism of the Holy Spirit for life and service; to look forward with fresh hope and encourage each other's hearts for the prospect of the glorious appearing of the Lord." All "who desire simple and fuller instruction in the Word of God, a more vivid manifestation of Jesus himself, a deeper Christian life, a special baptism of the Holy Spirit for services, and the work of the Lord, and in the hope of his appearing," were invited to attend this gathering, and "wait upon the Lord for a deeper and richer blessing for themselves, and a special outpouring of his spirit for the Church and the world."

The work of comparing experiences and narrating facts in regard to the faith-cure has also been carried on in England, Ireland, Canada, and other countries. The phenomenon, if such it may be called, is explained, by one who does not believe in it, as a religious effect, in the following way: "It is a curious phase of religious belief, and I have been interested in it for some time as an investigator.

It seems, certainly, to have more or less effect upon human ills in some persons; but, as a rule, the relief is only temporary, and that would seem to place it with magnetism or mesmerism. Then, again, we all know that a person's mental condition has great influence upon his bodily health, and where a patient 'effaces' himself, by relying implicitly upon an all-wise, all-powerful Providence, he throws off all care as to his future. When his mind is thus wholly at rest, he gives Nature its best aid in the process of recuperation. There are many undoubted cases on record where a patient, bedridden for years, suddenly gets up and walks about, by the order of a strong-minded, magnetic healer; but the effect is only temporary. When the exciting causes, both external and internal, cease, there is a collapse. I can illustrate this very well by a case that came under my own observation. An acquaintance of mine, a young woman, was far gone with consumption. She attended one of these meetings as a last resort, became enthusiastic, full of hope, and finally convinced that she would recover. She prayed and was prayed for, and, sure enough, there was a marked improvement in her condition. In about two months she looked upon herself as almost well, and the believers were jubilant; this was a case that must convince the most skeptical. Then the young woman suddenly died. You have, probably, at one time or another, heard an old clock suddenly begin to tick. Well, the human frame sometimes acts like that."

FARMERS' CONGRESS, an association of agriculturists of the United States, which has met annually since 1881, at Chicago, Washington, Louisville, Nashville, and Indianapolis. On Dec. 3, 1885, it was reorganized by the election of Robert Beverly, of Virginia, President; Benjamin F. Clayton, of Iowa, Secretary; and J. B. Conner, of Indiana, Treasurer, and adopted the following constitution:

1. This organization shall be known as the Farmers' Congress of the United States, and its object shall be to advance the agricultural interests of the Union.
2. This Congress shall be composed of the same number of delegates as each State and Territory is entitled to in its representation in the Congress of the United States, one member from each agricultural college, and all heads of Bureaus of Agriculture in each State and of the United States are *ex-officio* members of this organization.
3. The officers of this organization shall consist of a president, and one vice-president from each State and Territory of the United States, a treasurer, secretary, and two assistant secretaries, who shall serve for the period of two years.
4. The president, however, and assistant secretaries, shall be elected by the Farmers' Congress in open session by a *viva voce* vote or by ballot, as the Congress may decide. The vice-president shall be elected by the respective delegates from each State or Territory. In case any State or Territory shall have no delegates when the election occurs, the president shall, as soon as possible, appoint a vice-president for such State or Territory, and the list of such vice-presidents shall be reported at once to the Congress assembled.

5. It shall be the duty of the president to preside over the deliberations of the Congress, communicate with the same in regard to the objects in view, and advise with the vice-presidents and other officers of the organization so as to assist them in their duties.

6. It shall be the duty of the vice-presidents to appoint all necessary committee-men in the congressional districts in the respective States so as to perfect a thorough organization of the agricultural interest; provide necessary means to collect a sufficiency of money to defray the expenses of delegates to the Congress; see that all money collected is paid to the treasurer, and to fully do and perform all duties in his State that may advance the interest of the agricultural classes.

7. It shall be the duty of the treasurer to take charge of all money paid to him, to keep a true and perfect account of the same, and in no case to pay the expenses of any delegate until such delegate files a stated account of such expenses, and in no case use any money furnished by a congressional district to defray the expenses of a different district; and the treasurer shall report to the Congress whenever required.

8. The Governors of the different States and Territories are requested to appoint the delegates heretofore provided for, and also to appoint alternates; and, in case they should fail so to do, then the vice-presidents of the respective States, in conjunction with the Commissioner of Agriculture or Bureau of Agriculture, shall make such appointment of delegates and alternates, and in case the regular delegates fail to attend and the alternates do, the latter shall have all the rights and privileges of the regular delegates.

9. The secretary shall keep a full and perfect minute of the proceedings of the Congress, keep all papers belonging to the same, and furnish copies when required to do so by the president and vice-presidents. The assistant secretaries shall assist the secretary in the discharge of his duties.

10. No delegate shall be entitled to any compensation, except his actual expenses, while in the discharge of his duties.

11. Each delegate shall hold his office for the period of twelve months from the date of his appointment.

12. The Congress of Farmers shall assemble annually, and have full power to discuss, advise, and perform other duties that may, in their judgment, advance the interests of the agriculturists of the United States. The Congress in open session, by a majority vote, shall designate the time and place of its next meeting.

13. The constitution is subject to be amended by a majority of the delegates.

The most interesting session of the body was that at St. Paul, Minn., Aug. 25-27, 1886, in which twenty-seven States were represented.

Governor Hubbard, in his address of welcome, said:

We recognize the fact that agriculture is the basis of wealth. It is the independence of the masses. It keeps our industries in motion, and is the great resource of the commerce of the world. The country prospers as the farmer develops the soil; and so vast an interest should command the protection of every agency. It should receive legislative and executive recognition, national and State. Its voice should be heard through such organizations as the Farmers' Congress, demanding protection and relief from the unnatural burdens of monopolistic exaction. It is the purpose of this convention to consider questions of this character, and from your deliberations I hope much practical good will result.

Secretary Clayton, being called out, said:

This Northwest is becoming a giant. It is but a few years since your beautiful city was but a military outpost, and you had no means of transportation save

the uncertain channels of the Mississippi river. Your energy in developing the great Northwest, with its mighty resources, is the wonder of the world. The marvelous growth of these twin cities convinces me that behind all this display is the hand of the sturdy farmer of the Northwest, without whose labor you could not prosper.

President Beverly, in his annual address, said:

It becomes my duty for the fourth time to address you. Since our last meeting all industries have been passing through a period of depression such as has not been experienced by this generation. A pressing necessity demands some definite plan of organization. The resolutions adopted at your last meeting were submitted by your committee to the Congress of the United States, and were favorably reported by their committees to each house, where they sank out of sight beneath the dark seas of personal and party politics, with no friend to call them up for consideration. The President of the United States did venture to recommend to Congress the suggestion that it might be well to inquire whether any legislation might be considered in the interest of the agriculture of the country. Seeing that this business embraces a majority of the voters, this act on his part has been mentioned by his friends as one of peculiar boldness and originality. If our public servants feel themselves incapable of dealing with these questions, they must be discharged, and those who are capable must be employed in their places. If existing political parties are incapable of meeting the issues of the hour, we must organize ourselves as a committee of safety. If it be a question of whether the politician or the country must go to the bad, the politician must go. If agriculture is properly fostered, there is before this country a destiny great and marvelous, which may be easily blasted by unfriendly legislation discriminating in favor of an exacting and merciless monopoly. This pernicious policy of working the forces of the Government in the service of monopolies and moneyed men has so oppressed and degraded American labor that it is everywhere in a state of angry irritation and revolt; and from every hamlet the outlook is shrouded in darkness. The present Department of Agriculture, so called, is universally known to be incapable. It is a half-equipped experimental station, run as a part of the political spoils system, which some men believe has been supported by so-called civil-service reform, which, up to this time, is the greatest failure, farce, and fraud of the nineteenth century, and is utterly worthless to any body other than those few persons kept in its pay. This unfairness on the part of our officials must cease, or revolution will be the result. Agriculture is the great conservative power of the nation, standing in the breach between labor and capital; the friend of peace, of law, and of order, but eternally demanding such legislative recognition as will place our occupation and calling upon the highest social plane. Those measures recommended by you are essential to the well-being of all the people; and let us still urge their passage, untrammeled by party or political feeling. As long as we go home prepared to deliver our suffrages at the ballot-box on demand, so long we bow the knee to a *privileged class*. Organize, I beseech you; not to-morrow, but to-day! Combine, and stand together as one man in defense of your interests!

The "Farmer in Politics" was presented by Mr. Wallace, of Iowa, showing to what extent the agricultural classes of the country are duped by the modern politician, and suggested remedies.

An address by Mr. Conner, of Indiana, on "Commercial and Social Statics," was received with universal approval, as was that of Mr. McGinnis, of Minnesota, on the extension

of the Signal Service, and that of Prof. Morrow, of Illinois, on "Agricultural Education."

Mr. Coffin, of Iowa, read an exhaustive and able paper on "Transportation," which presented the arguments in favor of general legislation on inter-State commerce in the strongest light, and at great length.

After a full discussion of those measures, the Committee on Resolutions submitted the following, which were adopted:

That the Congress of the United States be and are hereby requested to pass an act creating the office of Secretary of Agriculture, with all the emoluments and privileges of other Cabinet officers.

That the Congress of the United States be requested to extend the benefits of the Signal Service to all stations, or portions of the United States permeated by telegraph, for the benefit of agriculture, by the necessary display of signals, or otherwise, as may be thought advisable for such stations.

That in view of the growing importance of inter-State commerce, and the impossibility of its regulation by separate State governments, this Farmers' Congress earnestly recommends to the Congress of the United States a prompt exercise of its constitutional powers to regulate commerce among the States in such a manner as to protect the productive interests of the country.

That the Farmers' Congress recommends to the Congress of the United States that the sum of three million dollars, or so much thereof as may be necessary, be appropriated to stamp out contagious diseases among all domestic animals wherever such diseases may exist; and that the Legislatures of the several States of the Union are respectfully requested to enact such laws as may be necessary to supplement the acts of the Congress of the United States for the extinction of all such contagious diseases.

That the Secretary of State be and he is hereby instructed to ask our ministers of France and Germany to use all proper means in their power to prevent the restrictions upon American farm-products properly inspected and shipped to those countries.

That we most earnestly urge upon the Congress of the United States the necessity of a speedy and complete development of the system of water-ways of the whole country, including the Mississippi river, as being of equal importance to all the great interests—commercial, industrial, and agricultural.

That we recommend the restoration of the wool-tariff to what it was in 1867, and the maintenance of the present tariff on rice and sugar.

That the Legislatures of the different States be respectfully but earnestly urged to pass such laws as may be necessary to prevent what is called "dealing in futures," so far as relates to agricultural productions of every description, and to provide that no contract shall be enforced in any court of law for future sale and delivery of agricultural productions unless it was the *bona-fide* intention of the seller to deliver, and the purchaser to receive, the article or commodity bargained for at the time the contract was entered into.

That we look with much favor upon the law recently passed by Congress in reference to the manufacture and sale of oleomargarine, and recommend the strict enforcement of the law, and that the manufacture of glucose in the United States be placed under the same law.

That the Congress of the United States is hereby requested to increase largely the annual appropriations to the Department of Agriculture, to be applied to the extension of the Signal Service, and to the establishment and endowment of State experimental stations; and further, that the members of this body are requested to urge their respective Senators and members of Congress to favor the appropriations asked for in the above resolution.

That a committee of one from each State be ap-

pointed to ask of the Congress of the United States the passage of an act incorporating the Farmers' Congress of the United States; said act to embrace the constitution hereafter adopted by this body as a part of its charter of incorporation. The President of this Congress shall be *ex-officio* chairman of said committee, and the Secretary of this Congress *ex-officio* Secretary thereof.

That the farmers of all the States of the Union be earnestly requested by the committee, nominated in the foregoing resolution, to organize in each State a Farmers' Assembly under such constitution as the farmers of each State may see fit to adopt, and that such Farmers' Assembly shall be incorporated under the laws of each State respectively.

That every such Farmers' Assembly shall be entitled to send representatives to this Congress as follows: One representative for each member of the House of Representatives, and one representative for each Senator of the Senate of the United States.

That this Congress respectfully recommends that the Farmers' Assembly of each State meet in annual session at the capitals of the respective States during the session of the Legislature, and that the representatives to this Congress shall be elected by such assembly.

That each delegate to this Congress is requested to urge local organization among the farmers of his district.

Whereas, it has come to the knowledge of this Congress that a late importation of three hundred and fifty-four head of cattle from Scotland to Quebec is found to be affected by the disease known as contagious pleuro-pneumonia, and the Canadian authorities have ordered the entire shipment slaughtered and cremated, and that an outbreak of this and other contagious diseases is continually brought to our notice as occurring throughout England and Scotland, believing that, unless the importation of cattle from these countries is prohibited, the great cattle industry of this country will be endangered: Therefore,

Resolved, That this Congress ask the Secretary of the Treasury to withhold his permit for the importation of cattle from those countries so long as any reasonable apprehension of danger shall exist from such importation.

The only call of States was on the tariff question, as presented in the seventh resolution, and resulted as follows:

After selecting Chicago as the place of meeting for 1887, the Congress adjourned.

FINANCIAL REVIEW OF 1886. At the end of this year the outlook was generally hopeful, although not wholly confident. Iron manufacturing, which had been very profitable and more extensive than ever before, gave promise of still greater development in response to the demands for railroad building and furnishing and structural work of various kinds. Other branches of manufactures, which had been held in check by the labor troubles, were in a condition to resume on an extended scale when-

ever this incubus was removed and with the revival of these industries and the establishment of more harmonious relations between capital and labor it was hoped that general trade would be more profitable in the next than it had been during the current year. No attempt was made, however, to conceal the fact that a great deal depended upon harmony between the employer and the employed. It was evident that if the latter intended to insist upon dictating rates of wages, hours of labor, and methods of management, and, moreover, proposed to interfere with or prevent the employment of persons willing to comply with salutary rules and accept such compensation as could be afforded, the friction between labor and capital would become so great that combinations of employers would have to be continued, where already formed, or organized, in cases where such organization had been deferred in the hope of accomplishing peaceful results by less harsh measures. The strikes early in the year among men employed in the manufacture of fabrics resulted in compelling the owners of the establishments to curtail their output, and in some cases the orders for the goods were transferred to Europe. The demand of workmen on clothing for higher wages and shorter hours came at a time when refusal would be ruinous to contractors, and, after the work in hand had been done, no more engagements were made, except with the proviso that they should be canceled if work was interrupted by labor-strikes. The knit-goods, boot and shoe, carpet, building, furniture, and almost all kinds of trades were at intervals suspended or interrupted during the year by disagreements of greater or less magnitude between employers and employed and these suspensions or interruptions induced such caution among the dealers in the articles affected as very materially to limit the volume of business and greatly reduce its profits. Unfortunately, there was little at the close of the year to encourage the hope that the lessons taught by the failure of the labor demands would prevent their repetition. On the contrary, it was feared that the various organizations throughout the country would secretly prepare for another effort to enforce their requirements, and, at an inopportune moment, precipitate a movement which would, temporarily at least, have a paralyzing effect upon all branches of trade and manufactures. While our troubles were confined to those resulting from labor-strikes in manufacturing establishments and on railroads, European countries had the almost constant menace of the Eastern question which in one form or another—first on the Afghanistan frontier, next in Greece, and finally in Bulgaria—kept political affairs in a state of tension, and at times, when outbreaks were threatened, deranged the financial affairs of the principal business centers. For the first half of the year England was in a state of expectancy over the Irish question. The defeat of the Gladstone ministry on the

issue of home-rule ended the suspense, and thereafter domestic peace was interrupted only by the agitation of a few malcontents. The finances of Europe were kept in a condition of uncertainty by the efforts of each nation to get more gold and retain its possessions of that metal, and early in the year France succeeded in drawing from all the nations of Europe and also from America an amount sufficient to enable her successfully to float her loan of 1,446,-000,000 francs. After this Germany commenced to absorb the metal, drawing it from London, Paris, and America, but this movement, as was explained toward the close of the year, was caused by sales by Germany to the Egyptian Government of its stock of silver bars, amounting to 2,267,232 troy ounces, and of 1,143,000 marks of silver coin. During the first six months of the year the United States sent to Great Britain, France, and Germany, \$29,494,110 in gold. The import movement which commenced in August resulted in the receipt of \$34,723,067, the principal part being taken from France. The sales of silver by Germany will in part explain the cause of the fall in the price of the metal in London from 47 pence per ounce, at the beginning of the year, to 42 pence July 31, and the subsequent recovery to 47 $\frac{1}{16}$ pence November 19 was partly due to the appointment of a British commission to inquire into the relative values of gold and silver, and in part to purchases by France in London and New York of bullion amounting in value to about 7,000,000 francs, for coinage into money for circulation in Tonquin. The anxiety that was felt early in the year regarding the ability of the Treasury Department to maintain gold payments of its balances at the Clearing-Houses was allayed, first by the settlement of such balances with gold instead of partly with United States notes; and, secondly, by the exhibition of the results of the policy adopted by the department of issuing silver certificates in exchange only for the coins, and thus reducing the volume of such certificates. The reports of the Treasurer, showing monthly receipts at New York from customs, indicated, as the result of this policy, a reduction in the percentage of silver certificates received, from 23 $\frac{3}{4}$ in July, 1885, to 8 $\frac{1}{2}$ in February, 1886, while the receipts of gold certificates had increased from 28 $\frac{1}{2}$ in July, 1885, to 60 $\frac{1}{2}$ in December, and United States notes had been augmented from 16 $\frac{3}{4}$ in October, 1885, to 84 $\frac{1}{2}$ in July, 1886. These changes aided in increasing the net gold balance of the treasury from \$136,086,610 January 31 to \$156,793,749 June 30, and to \$163,930,220 by Nov. 30, 1886, although during the calendar year \$127,000,000 bonds had been called, and nearly the whole redeemed. While the market price of silver was steadily declining in London, thus reducing the intrinsic value of our coins, we were freely exporting gold to Europe, but confidence in the wise administration of the national finances was apparently so great that only a

faint and entirely unsuccessful attempt was made to excite alarm, and even those capitalists who at intervals in 1885 and in the early part of the current year invested in sterling for safety, and also to insure gold returns, abandoned these investments during March. Unfortunately, Congress did little toward restoring confidence in the national finances. On the 8th of January, Mr. Eustice introduced a resolution in the Senate proposing to pay with silver the \$10,000,000 3-per-cent. bonds called on Dec. 29, 1885, for redemption, and this temporarily had an unsettling effect upon the London market for bonds, but this proposition was not seriously considered by the Senate. Early in February the House passed a resolution calling upon the Secretary of the Treasury for an explanation of the policy inaugurated by the department during the previous summer, but the Secretary's reply was complete, and regarded as satisfactory. April 8 Mr. Bland's bill, providing for the free coinage of silver was defeated in the House, but the vote showed that this was the best that could be expected, and that there was no hope, at least in that Congress, for the repeal of the coinage act. In June Mr. Morrison introduced a joint resolution in the House requiring the Secretary of the Treasury to call bonds, regardless of the condition of the gold reserve. This resolution was sent to the Senate, there amended by making such calls discretionary with the Secretary, and it was further amended by providing for the redemption of the trade-dollar; but, although these amendments were concurred in by the House, the resolution failed for want of the signature of the President. After the middle of the year until December the disturbances resulting from the labor troubles subsided, gold flowed hither from Europe, railroad earnings improved, the crops were abundant, specula-

tion in stocks and staples gradually increased, money commanded better rates, thus causing its withdrawal from boards and other depositories, and the outlook was encouraging for all interests. Trading in stocks, however, seems to have been overdone, with the usual results, and in December forced liquidations of speculative accounts, caused by active money and an indisposition to loan upon a certain class of collateral, kept the stock and other markets unsettled during the greater part of the month, and imparted a feeling of anxiety at the close of the year, which was somewhat intensified by a renewal of labor troubles in Brooklyn, Pittsburg, and other cities, and more or less important failures of business houses in various parts of the country. The following tabular survey of the economical conditions and results of 1886, contrasted with those of the preceding year, is from official returns, and also from the "Commercial and Financial Chronicle":

ECONOMICAL CONDITIONS AND RESULTS.	1885.	1886.
Coin and currency in the United States, November 1.	\$1,556,914,798	\$1,586,271,000
Mercantile failures.....	124,220,821	114,644,119
Imports of merchandise	557,565,673	668,417,210
Exports of merchandise.....	658,249,798	713,259,666
Imports of gold and silver.....	41,418,029	58,528,809
Exports of gold and silver.....	44,697,749	63,821,566
Railroads constructed, miles.....	8,118	8,648
Gross earnings, 93 railroads.....	814,288,444	844,852,956
Wheat raised, bushels.....	357,112,000	457,000,000
Corn raised, bushels.....	1,936,176,000	1,665,000,000
Cotton raised, bales.....	6,550,215	6,412,000
Pig-iron produced, tons (2,240 pounds).....	4,044,526	5,684,548
Anthracite coal produced, tons.....	81,623,529	82,186,362
Petroleum, barrels.....	21,225,208	26,000,000
Immigration	326,151	386,755

The prices of leading staples on or about the 1st of January, 1887, compared with prices at the same date in 1886 and 1885, were as follow:

PRICES OF LEADING STAPLES.	1885.	1886.	1887.
Cotton, middling uplands, per pound	11½	9½	9½
Wool, American XX, per pound	34 @ 36	87	84 @ 88
Iron, American pig, No. 1, per ton.....	\$19 50 @ \$20 50	\$18 00 @ \$18 50	\$20 00 @ \$21 90
Steel rails at mills.....	\$25 00	\$34 00 @ \$35 00	\$37 00
Wheat, No. 2 red winter, per bushel.....	84 @ 86	92½	93½
Corn, Western, mixed No. 2, per bushel.....	58 @ 54½	56½	45½
Pork, mess, per barrel.....	\$12 50 @ \$13 00	\$10 00 @ \$10 25	\$12 50 @ \$12 75

The Money Market.—During the first quarter of the year bankers' balances were loaned at the Stock Exchange at 1 and at 5 per cent., averaging from 2½ to 3, and in February loans on commercial paper were made at very low rates, such as 2½ to 4½ on four months' acceptances, 2½ to 3½ on 60 to 90 day indorsed bills receivable, and 4 per cent. on some good single names, while a fair grade of jobbers' paper was done at 4½ to 5½ per cent. Trust companies were then making loans on stock collateral, running to the end of the year, at 4 per cent., and banks were obliged to accommodate their customers at equally low rates. The silver question tended to drive capital into hoards, thus largely augmenting the deposits of the

Trust Companies and other institutions, and in their desire to place their money where it would be safe and at the same time earn fair returns, investors drained the market of first-class railroad securities, in some cases paying prices which did not yield more than 4 per cent. Others bought sterling for investment, and still another class purchased real estate, but very few put their money into manufacturing or business enterprises, being deterred by the fear of a spread of the labor troubles which early in March began to attract attention. Toward the end of the first quarter the bank reserves were low, in consequence of withdrawals of gold for shipment to Europe, and also because of a demand from the interior,

and banks were indisposed to loan freely on call, and they did nothing below 3 per cent. In April there was an easier tone for money, caused by the improved condition of the banks, resulting from the satisfaction of the demand from the interior, and a little less anxiety was felt regarding the silver question, the defeat by the House of Representatives, on the 8th, of Mr. Bland's bill providing for free coinage of silver, and the conviction that the policy of the Treasury Department would enable gold payments to be maintained, largely contributing to this feeling of relief. During the first week in May there was a slight flurry in money, and an advance to 7 per cent. on call, caused by the rioting at Chicago, but the rate subsequently fell off, and the average for the month was not above 4 per cent. About the middle of May the banks restricted their loans because of low reserves and the concentration in three of the institutions of about 85 per cent. of the whole surplus, and commercial paper was only in fair supply, although the demand was not urgent. Rates were then quoted at 4 to 4½ per cent. for short acceptances, 4 to 5 for jobbers' paper, and 4½ to 6 for good single names. In June, bankers' balances loaned at 1 and at 7 per cent., the higher rate being recorded toward the close, and it was inferred from the fact that there was only a light inquiry for loans on time on stock collateral, the best bid being 3½ per cent. for the remainder of the year, that money was likely to remain easy. During the last few days in June, however, the tone of the market changed in consequence of a calling in of loans by some of the banks and trust companies, in order to prepare for the July disbursements of interest and dividends, and early in the following month 9 per cent. was recorded. The average subsequently fell off to 2½ and 3 per cent., and the market was easy until toward the end of the month, when it became active not only on call but for commercial paper. Banks refused to loan at less than 4 per cent. on prime security, and only a few were in a position to offer money at the Exchange by reason of low reserves and calls upon them by their correspondents at the interior. This threw the demand upon the Stock Exchange, and the average for bankers' balances gradually rose to 4 per cent. The banks being practically out of the market for paper, rates advanced, and 60 to 90 day indorsed notes were quoted at 4 to 4½ per cent.; four months' jobbers' names, at 4 to 5, and good single-name notes having four to six months to run, 5 and 6½ per cent. During the first week in August money became still more active on call, and the supply at the Exchange being limited, opportunity was afforded for manipulation. Two of the largest banks were then carrying two thirds the total surplus reserve, and the remainder was distributed among three other banks. Those in a condition to buy paper refused to take any below 5½ to 6 per cent., and time-loans on stock collateral

commanded 4 and 5 per cent. for four months, the rate depending upon the character of the security. Eastern banks had full employment for all their funds; Western institutions were engaged in supplying the demands of grain-buyers and stock-raisers, and they were almost daily drawing upon their New York deposits. During the second week in August there was a manipulated advance in the rate for money at the Stock Exchange to 40 per cent., for the purpose of unfavorably influencing the stock speculation. On the following day, after the demand had been supplied, the rate fell to 1 per cent., but 7 was a fair average for both days. The bank return of the 12th showed that two of the institutions were carrying nearly the whole of the \$8,647,250 surplus, leaving the remainder either at or below the 25 per cent. limit. This condition of the banks induced a few of them to call in loans, the trust companies had to meet a demand for some of their deposits, and they in turn called upon the banks, so that the activity in money had a legitimate basis. On the following week there was a flurry in money, during which the rate was marked up to 20 per cent., caused by the financial troubles at Boston, growing out of the defalcation of Gray, the Indian Orchard and Atlantic Mills treasurer, but, as was the case in the previous week, the rate the next day fell to 1, and the average thereafter was not above 7. With the object of relieving the stringency in the money market, the acting Secretary of the Treasury, on the 19th, issued a call for \$15,000,000 3-per-cent. bonds. In the closing week of the month there was an advance in money to 9 per cent., caused by the calling in of loans by some of the trust companies, but the average was not above that of the previous week. Some of the life-insurance companies and other institutions were then making loans on stock collateral at 6 per cent. for the remainder of the year, but they required first-class security and ample margin. There was no sale for commercial paper at the close of August, except at high rates, and not more than one of the city banks was purchasing notes. For this reason, quotations for paper were nominal. On the last day of the month, the Secretary of the Treasury gave notice that any part of \$10,000,000 3-per-cent. uncalled bonds would be redeemed if presented before September 15, and this order was subsequently modified so as to include any un-called bonds. There were then outstanding two calls, one for \$15,000,000 and another for \$10,000,000; but as most of these bonds were owned by the banks, and held as security for circulation, redemptions were slow, and the relief to the market almost imperceptible. Gold imports commenced during the middle of August, and these aided to some extent in enabling the banks to meet the drain to the interior and for customs. Early in September the average for call loans was 6 to 7 per cent. and the extremes 1 to 9. The Treasury disbursed comparatively large

amounts for interest, and moderately for the calls maturing September 1 and 15, and the banks gradually grew easier, so that they purchased paper to a limited extent; but mainly for the purpose of replacing matured notes. A few were in a condition to offer money at the Stock Exchange, but they exacted good security, and demanded the best average rates. The Secretary of the Treasury issued a call for \$15,000,000 on the 15th, and directed that any of the called bonds be paid with interest to the date of presentation, without waiting for the maturity of the call, but, for reasons above stated, redemptions were comparatively light. One feature toward the close of the month, was a slight flurry at Boston, Providence, and Hartford, caused by defalcations by the President of a Portland (Me.) bank, and by the President of the Charter Oak Life-Insurance Company, and of the Union Manufacturing Company. Although in an improved condition as regards reserve, the banks were not disposed to be liberal in their offerings of money, as they desired to make preparations for meeting the mercantile demand, which was expected from the 1st to the 10th of October. The lowest rate for commercial paper was 6 per cent., and some banks were seeking to make six months time loans on stock collateral at this rate, but borrowers generally declined to make engagements running beyond the end of the year. Early in October, a 10-per-cent. rate on call was recorded, caused by calling in loans, and also by a demand for money on collateral unacceptable to conservative lenders. Borrowers with good security had no difficulty in obtaining funds at 6 per cent., but the speculation in fancy stocks, and the rapid rise in a few specialties, compelled some houses to ask loans on these properties as collateral, and they were required to pay from 7 to 10 per cent. Twice during the month 1 per cent. was recorded, but as the day's demand had then been supplied, this rate was not fairly quotable. Toward the close of the month, the banks became easier, and there was a better inquiry for first-class commercial paper at a minimum rate of 5½ per cent. One feature was a rise in United States bonds to the best figures ever recorded, caused by a good demand and a very moderately supplied market. In the following month, however, there was a sharp fall in these securities, followed by an important rise. It was stated that the purchases by the banks of 4 and 4½ per cents. with which to replace called bonds were light, and confined to amounts which would satisfy the requirements of the national banking law, and the majority of the banks seemed disposed to reduce their circulation rather than pay the current prices for new bonds. One cause for the reduction in the bank reserves was the deposit of money at the sub-treasury in exchange for new silver certificates, which were largely issued during October, and distributed among the banks of the entire country. Early in November, money

was active on call, partly because of manipulation, but mainly in consequence of the demand for loans upon undesirable collateral. Subsequently, the market became easier, but toward the close of the month the enormous speculation at the Stock Exchange, which largely increased the inquiry for funds, caused rates to advance, and 20 per cent. was recorded during the last week. The average for the month was from 5½ to 7 per cent., according to the collateral offered. The rates for commercial paper at the close were 5½ to 6½ per cent., for sixty to ninety day indorsed bills receivable; 6 to 7 for four months commission-house names, and 6 to 8 for good single names having four to six months to run. The rate for money on prime stock collateral for four months was 6 per cent. Nearly all the paper taken was bought by out-of-town institutions. Early in the month, the Secretary of the Treasury ordered the payment without rebate of the interest due December 1, amounting to \$2,812,500, and with a rebate of 3 per cent. per annum of the interest due January 1, amounting to \$9,316,469, making a total of \$12,128,969, the object being to relieve the money market. December opened with activity in loanable funds, caused in great part by the speculation in stocks and staples, and by the demand for loans upon indifferent collateral, but, as was the case in the previous month, borrowers with good security were accommodated at an average of about 6½ per cent., while others had to pay from 7 to 12, and even more in exceptional cases. On the 15th a panicky fall in certain stocks, which had been sharply advanced, caused a calling in of loans by banks and private lenders, the rate for many rose before the close of the day to 186 per cent. per annum, and the excitement did not subside so as to permit the market to resume its normal condition until the 17th. Thereafter, for the remainder of the month, money was not unusually active, relief being afforded by Treasury disbursements of interest, that due January 1 being ordered paid without rebate, and also by arrivals of gold from Europe. At the beginning of the year, the banks of this city had an average of \$89,721,100 gold. This was increased to \$100,212,200 by the end of January, and after this there was a gradual reduction, mainly due to gold exports, and a drain into the Treasury for customs, so that by July 17 the average amount held was \$63,723,700, the minimum of the year. Thereafter, principally through gold imports, the amount was increased to \$80,709,700 by November 20. On January 3, the banks held an average of \$28,808,200 legal-tender notes, which was increased to \$35,882,600 by February 13. Then came a reduction to \$26,241,100 April 3, caused by a drain to the interior. This was followed by a gradual increase to \$45,069,000 July 17, when the demand for the country again set in, and by November 6 the amount held was reduced to \$16,242,600, the

minimum of the year. Thereafter, there was a slight increase to the end of the year. Bank loans on January 2 were reported at \$339,909,800. The maximum of \$359,685,300, was reached March 20, and then came a reduction to the minimum of the year, \$337,307,600, September 18. Speculative and commercial demands then brought about an increase to \$352,413,500 on December 11. The average deposits were at the maximum, \$396,080,800, February 13, and at the minimum, \$345,708,500, September 11. The advance to \$360,981,400, December 4, was largely due to the augmented loans, and to the increase in the cash held by the banks. The clearings of the associated banks of the city showed a daily average at the beginning of the year of \$121,617,-

439. Then followed a fall to \$96,728,279, March 13, and recovery to \$130,429,617 on the following week, a decline to \$80,922,591, September 4, and a reaction to \$165,589,361 December 18, which was the maximum of the year.

The Comptroller of the Currency reports the failure of eight national banks, having an aggregate capital of \$650,000, during the year covered by his communication to Congress, and four of the suspensions were caused by embezzlements. The condition of the New York Clearing-House banks, the rates for money, exchange, and silver, and prices for United States bonds on or about Jan. 1, 1887, compared with the preceding two years, are shown in the following summary:

BANK RETURNS, ETC.	1885.	1886.	1887.
NEW YORK CITY BANKS:			
Loans and discounts.....	\$295,874,200	\$339,009,800	\$343,687,500
Specie.....	88,170,500	89,721,100	82,718,100
